but meadows and pastures are rare. Maize, millet, rye, flax, liquorice and fruits of all sorts—especially nuts, almonds, oranges, figs, walnuts and chestnuts—are produced. Wheat sufficient for one-fourth of the population is grown, and the vine is extensively cultivated. Few cattle, but large numbers of sheep, goats and swine are reared. Game is plentiful, and the fisheries on the coast are excellent. The wines are for the most part rough and strong, though some are very good, especially when matured. They are much used to adulterate those of Oporto, or, after undergoing the blending operation termed *compage*, are passed off as Bordeaux wines in France. The best of them, *priorato*, is chiefly known in England, under the disguise of second or third-rate port; it was much used in the military hospitals of America during the Civil War.

The Catalonians are a frugal, sharp-witted, and industrious people, having much national pride, and a strong revolutionary spirit. They are distinct in origin from the other inhabitants of Spain, from whom they differ in their dialect and costume. In their great energy and their love of enterprise they resemble the Basques. Irrigation, careful husbandry and railroad communications have much developed the resources of their country, in themselves excellent; and there are many manufacturing towns and industrial establishments.

Catalonia was one of the first of the Roman possessions in Spain, and formed the north-eastern portion of Hispania Tarraconensis. Gotland was conquered by the Moors in 712, but these invaders were in turn dispossessed by the Spaniards and the troops of Charlemagne in 788. Catalonia was subsequently ruled by French counts, who soon, however, made themselves independent of France. By the marriage of Count Raymond Berenger IV. of Barcelona with Petronilla of Aragon, Catalonia became annexed to Aragon; but this union was frequently severed. In 1640, when Philip IV. attempted to deprive Catalonia of its rights and privileges, it gave itself up to Louis XIII. of France. It was restored to Spain in 1659, and was once more occupied by the French from 1694 to 1707. Under Philip V. Catalonia, in 1714, was deprived of its cortes and liberties. From 1808 to 1813 it was held by France. It was the scene of civil war in 1823, and of important revolutionary operations in the Carlist wars.

The history and literature of Catalonia have been closely studied, and the most important monographs and papers on the language are published in Spanish. See Catalunya, *los monumentos y arte, su naturaleza e historia* (2 vols. of the illustrated series España), by P. Pifferrer, F. Pl Margall, and A. A. Pijoan (Barcelona, 1884); *Historia de Catalana* by J. B. B. Requesens (Barcelona, 1830); *El idioma catalán*, by A. Bori y Fontest (Barcelona, 1898); *Origenes historicos de Cataluna*, by J. Balari y Jovany (Barcelona, 1899); *Colecion de monografias de Catalunya*, by J. Reig y Villardell (Barcelona, 1905). See also *Dictionnaire de la langue catalane*, by B. Oliver (Madrid, 1874-1880), and *Antiqua marina catalana*, by F. De Boarull y Sans (Barcelona, 1898). The *Revista catalana* in English (Catalan Review), published at Barcelona from 1889, contains many valuable papers on local affairs. See also SPAIN: sections Language, Literature and History, and BARCELONA.

Catalpa—Catalysis

A familiar instance of a catalytic action is witnessed when a mixture of potassium chloride and manganese dioxide is heated to 350°, oxygen being steadily liberated, and the manganese dioxide being unchanged at the end of the reaction. The action may be explained as follows:—part of the chlorate reacts with the manganese dioxide to form potassium permanganate, chlorine and oxygen; the chlorine subsequently reacting with the permanganate to produce manganese dioxide, potassium chloride and oxygen, thus:

$$2\text{KClO}_3 + 2\text{Mn}_2\text{O}_7 = 2\text{K}_2\text{MnO}_4 + \text{Cl}_2 + \text{O}_2$$

This explanation is supported by the facts that traces of chlorine are present in the gas, and the pink permanganate can be recognized when little dioxide is used. Other oxides bring about the same decomposition at temperatures below that at which the chlorate yields oxygen when heated alone; but since such substances as kaolin, platinum black and some other finely powdered compounds exercise the same effect, it follows that the explanation given above is not quite general. Another example is Deacon's process for the manufacture of chlorine by passing hydrochloric acid gas mixed with air over heated bricks which had been previously impregnated with a copper sulphate solution. The nitrous gases employed in the ordinary chamber process of manufacturing sulphuric acid also act catalytically. Mention may be made of the part played by water vapour in conditioning many catalytic reactions. This substance will not react with chlorine or dry oxygen; carbon, sulphur and phosphorus will not burn in perfectly dry oxygen, neither does nitric oxide give red fumes of the peroxide. In organic chemistry many catalytic actions are met with. In the class of reaction known as "condensations," it may be found that the course of the reaction is largely dependent upon the nature of some substance which acts catalytically. One of the most important is the Friedel and Craft's reaction, in which an aromatic compound combines with an alkyl haloid in the presence of aluminium, zinc or ferric chloride. It seems this, as in other cases, that addition compounds are first formed which subsequently react with the re-formation of the catalyst. The formation of benzoin from benzaldehyde in the presence of potassium cyanide is another example; this action has been investigated by G. Bredig and Stern (*Zeit. Elektrochem.*, 1904, 10, p. 582).

The second class of catalytic actions, viz. those occasioned by the presence of a metal or some other substance which undergoes no change, is of especial interest, and has received much attention. The accelerating influence of a clean platinum plate on the rate of combination of hydrogen and oxygen was studied by Faraday, and the result was confirmed by other investigators, including that of action increased until the mixture exploded. The presence of minute quantities of carbon monoxide, carbon disulphide, sulphuric acid and hydrochloric acid inhibited the action; in the case of the first two gases, there is no alteration of the platinum surface, since the plate brings about combination when removed to an atmosphere of pure hydrogen and oxygen; with the last two gases, however, the surface is altered, since the plate will not occasion the combination when placed in the pure gases. M. Bodenstein (*Zeit. phys. Chem.*, 1904, 46, p. 725) showed that combination occurs with measurable velocity at ordinary temperatures in the presence of compact platinum. More energetic combination is observed if the metal be finely divided, as, for instance, by immersing asbestos fibres in a solution of platinum chloride and strongly heating. The "spongy" platinum so formed brings about the combination of ammonia and oxygen to form water and nitric acid, of nitric oxide and hydrogen to form ammonia (see German Patent, 1905, 157, 87), and of sulphur dioxide and oxygen to form sulphur trioxide. The last reaction, which receives commercial application in the contact process of sulphuric acid manufacture, was studied by M. Bodenstein and W. Pohl (*Zeit. Elektrochem.*, 1905, 11, p. 373), who found that the equilibrium followed the law of mass-action (see also F. W. Küster, *Zeit. anorg. Chem.*, 1904, 42, p. 453, R. Lucas, *Zeit. Elektrochem.*, 1905, 11, p. 457). Other metals, such as nickel, iron, &c., can also react as catalysts.
The use of finely divided nickel (obtained by reducing the oxide in a current of pure hydrogen at a temperature of 350°) has been carefully studied by P. Sabatier and B. Senderens; a summary of their results is given in the Ann. Chem. Phys. 1903 (9th S., p. 2132-2135). Of special interest is the condensation of acetylene.

If this gas mixed with hydrogen be passed over the reduced nickel in the cold, the temperature may rise to as high as 150°, the acetylene disappearing and becoming replaced by a substance like petroleum. If the nickel be maintained at 200°, and the gases circulated for twenty-eight hours, a product, condensable to a yellow liquid having a beautiful fluorescence and boiling at 45°, is obtained. This substance closely resembles ordinary Pennsylvania petroleum. If acetylene be passed alone over nickel heated to 200°-300°, a mixture, boiling at 68°-70° and having a green colour by diffused and a red by transmitted light, was obtained. This substance closely resembles Caucasian petroleum.

The decomposition of carbon monoxide according to the reaction $2\text{CO}_2\text{C}+\text{CO}_2$ is purely catalytic in the presence of nickel and cobalt, and also in the presence of iron, so long as the amount of carbon dioxide present does not exceed a certain amount (R. Schenck and W. Heller, Ber., 1905, 38, pp. 2132, 2135). It is of interest that finely divided aluminium and magnesium decompose methane, ethane, and ethylene into carbon and hydrogen in the same way as nickel. Charcoal at 550° also reacts catalytically; for example, Senderens found that ethyl alcohol was decomposed by animal charcoal into methane, ethylene, hydrogen, carbon monoxide and a little carbon dioxide, and propyl alcohol gave propylene, ethane, carbon monoxide and hydrogen, while G. Lemoine obtained from ethyl alcohol and wood charcoal a mixture of acetaldehyde and hydrogen.

CATAMARAN (a Tamil word, from "catto", to tie, and "marom" wood), a surf or boat used by the natives of Madras and along the Coromandel Coast in India. It is usually made of three tree trunks lashed together, the centre trunk being the largest and longest, and having one end bent upward to form a kind of prow. Catamarans of a larger size are in use in the West Indies and South America. The name is also given to two boats lashed together. Apparently through an erroneous connexion with cat, the name has been applied to a noisy scolding woman.

CATAMARCA, an Andean province of the Argentine Republic, lying W. of Santiago del Estero and Tucuman and extending to the Chilean frontier, with Los Andes and Salta on the N., Cordoba on the S.E., and Rioja on the S. Pop. (1895) 90,181; (1904, estimate) 103,082; area, 47,531 sq. m. The surface of the province is extremely broken, the Andes forming its western boundary, and the Aconcagua, Ancaste, Ambato, Guallampa and Los Andes rivers, running through it, are very difficult to navigate. It is composed very largely of high plateaux with a general slope southward broken by a few fertile valleys. The greater part of the province is arid and barren, being sheltered from the moist, eastern winds by the high mountain barriers of Aconcagua and Ancaste. The rivers are small, and some of them are lost in the barren, sandy wastes. Others, especially in the foothills of the high sierras, are utilized to irrigate the fertile valleys. The climate of some of the low, sheltered valleys is extremely hot and unhealthy, but on the open plateaux it is peculiarly dry and bracing and is probably beneficial in the treatment of pulmonary diseases. The mineral resources of the province include gold, silver, copper, lead, nickel, iron, coal and malachite, but of these only copper and silver are mined, and these chiefly in the Andalgala district. Salt deposits also exist, but are worked only to a limited extent. Cereals, alfalfa and fruit are grown. Large numbers of cattle, fattened in the alfalfa fields of Pucará, Tinogasta and Copacabana, are driven into northern Chile across the San Francisco pass (13,124 ft. above sea level) and mules are bred for the Bolivian market. Wine of an excellent quality is produced and exported. Tanning leather is another industry of the province; some of the trees growing in the Catamarca forests being rich in tannin.

Catamarca is traversed by the Northern Central railway between Cordoba and the city of Catamarca, its capital, which passes around the southern extremity of the Sierra de Ancaste and makes a long detour to Chumbicha, near the Rioja frontier. The more important towns, after Catamarca, the capital, are Andalgala and Tinogasta with populations (estimated, 1904) of 5000 to 6000 each. Belen is the oldest Spanish settlement in the province and was founded in 1550, being called partida at first. The population is largely mixed with Indian blood.

CATAMARCA (San Fernando de Catamarca), capital of the above province on the Rio del Valle de Catamarca, 230 m. (318 m. by rail) N.N.W. of Cordoba. Pop. (1895) 7397; (1904, estimate) 8000, with a large percentage of mestizos. Catamarca is connected by railways with Rioja and Patagia and with Cordoba. The city stands in a narrow, picturesque valley at the foot of the Sierra de Ambato, 1772 ft. above sea level. The valley is highly fertile, partially wooded, and produces fruit in abundance, wine and some cereals. In the city are flour mills and tanneries, and among its exports are leather, fruit, wine, flour, and a curious embroidery for which the women of Catamarca have long been famous. There is a fine church, 220 by 90 ft., and a national college occupies the old Merced convent. The alameda is one of the prettiest in the Argentine Republic, having a reservoir of two acres surrounded by shrubbery and walks. Catamarca was founded in 1685 by Fernando de Mendoza because the town of Chacra, the former provincial capital, a few miles north of Catamarca, had been found unhealthy and subject to inundations. Previous to the selection of Chacra as the provincial capital, the seat of government was at San Juan de Londres, founded in 1558 and named after the capital of England by order of Philip II. In honour of his marriage with Queen Mary, the arid surroundings of Londres led to its partial abandonment and it is now a mere village. Cholla, a suburb of Catamarca, is inhabited wholly by Calchaqui Indians, a remnant of the original inhabitants of this region.

CATANIA (Gr. Katai, Rom. Catina), a city and episcopal see of Sicily, the chief town of the province of Catania, on the east coast, 59 m. by rail S. of Messina, and 151 m. by rail S.E. of Palermo (102 m. direct). Pop. (1881) 100,417; (1905) 157,722. The principal buildings are handsome, and the main streets, meeting in the Piazza del Duomo, are fine. The cathedral of S. Agatha, containing the relics of the saint, retains its three original Norman apses (1091), but is otherwise a large baroque edifice. The monument of Don Fernando d'Acunca, a Spanish vicerey of Sicily, is a fine early Renaissance work (1494). In the west portion of the town is the huge Benedictine abbey of S. Nicola (now suppressed), the buildings of which occupy an area of about 21 acres and contain the museum, a library, observatory, &c. The church, dating like the rest of the buildings, from 1328, is in the form of a Greek cross; it contains an organ, built in 1760 by Donato del Piano, with 72 stops and 2016 pipes, very fine. The university, founded in 1444, has regained some of its former importance. To the south near the harbour is the massive Castell' Ursino, erected in 1232 by Frederick II. Remains of several ancient buildings exist, belonging in the main to the Roman period. The theatre, covered by a stream of lava, and built partly of small rectangular blocks of the same material, though in the main of concrete, has been superimposed upon the Greek building, some foundations of which, in calcareous stone, of which the seats are made, still exist. It is 106 yds. in diameter, and is estimated to have accommodated 7000 spectators. Close to it are the remains of the so-called Odeum, of similar plan to the theatre but without a stage, and to the north is the church of S. Maria Rotonda, originally a Roman domed structure, perhaps part of a bath. To the north, in the Piazza Stesicoro, is the amphitheatre, a considerable portion of which has been uncovered, including the two corridors which ran round the whole building and gave access to the seats, while a part of the arcades of the exterior has been excavated and left open; the pillars are made of blocks of lava, and the arches of brick. The external diameters of the amphitheatre are 430 and 348 ft., while the corresponding diameters of the arena are 253 and 167 ft. It is thus the third largest Roman amphitheatre known, being surpassed only by that at Verona and the Colosseum. Remains

1 This is the form vouched for by the inscriptions.
of many other Roman buildings also exist beneath the modern town, among the best preserved of which may be noted the public baths (Thermae Achilleae) under the cathedral, and those under the church of S. Maria dell' Indirizzo. The number of baths is remarkable, and gives some idea of the luxury of the place in Roman times. Their excellent preservation is accounted for by their burial under the lava. The majority were excavated by Prince Ignazio Biscari (1719-1786), who formed an important private collection of antiquities. Of the ancient city walls no authenticated remains exist.

Catania has a considerable export trade in sulphur, pumice stone, asphalt, oranges and lemons, almonds, filberts, cereals, wine (the total production of wine in the province amounted to 28,600,000 gallons in 1905) and oil. The total value of exports in 1905 was £1,647,075, and of imports £1,326,025, the latter including notably coal, almost entirely from the United Kingdom, and wheat, from Russian ports. The harbour is a good one, and has been considerably enlarged since 1871; £128,000 was voted in 1905 towards the completion of the harbour works by the Italian government. Sulphide of carbon is produced here, and there are large dyeworks, and a factory for making bed-stuffing from seaweed.

The town of Catania was founded in 729 B.C. by colonists from Naxos, perhaps on the site of an earlier Siculo settlement — the name is entirely un-Greek, and may be derived from κατάνιος, which in the Sicel language, as catinum in Latin, meant a basin, and would thus be descriptive of the situation of the town. Charondas, a citizen of Catina, is famous as its lawgiver, but his name and his birthplace are alike uncertain; the fragments preserved of his laws show that they belong to a somewhat primitive period. The poet Stesichorus of Himera died here. Very little is heard of Catina in history until 476 B.C., when Hiero I. removed its habitants to Leontini, repeopled it with 5000 Syracusans and 5000 Peloponnesians, and changed its name to Aetna. In 461 B.C., however, with the help of Ducecius and the Syracusans, the former habitants recovered possession of their city and revived the old name. Catina was, however, an ally of Athens during the Syracusan expedition (415-413 B.C.), and served as the Athenian base of operations in the early part of the war. In 403 B.C. it was taken by Dionysius of Syracuse, who plundered the city, sold the habitants into slavery and replaced them with Campanian mercenaries. In the First Punic War, it was occupied by the Romans (263 B.C.). Marcellus constructed a gymnasium here out of the booty of Syracuse. In 123 B.C. there was an eruption of Etna so violent that the tide on the territory of Catina payable to Rome was remitted for ten years. It appears to have been a flourishing city in the 1st century B.C., but to have suffered from the ravages of Sextus Pompeius. It became a Roman colony under Augustus, and it is from this period that the fertile plain, hitherto called the plain of Leontini, begins to be called the plain of Catina. It seems to have been at this time the most important city in the island, to judge from the language of Strabo and the number of inscriptions found there. In A.D. 251 a lava stream threatened the town and entered the amphitheatre, which in the time of Theodoric had fallen into ruins, as is clear from the fact that he permitted the use of its fallen stones to build the city wall. It was recovered by Belisarius in 535, sacked by the Saracens in 992 and taken by the Normans. The latter founded the cathedral; but the town was almost entirely destroyed by earthquake in 1170, and devastated by Henry VI. in 1197. It became the usual residence of the Aragonese viceroys of the 15th and 16th centuries. In 1660 an eruption of Etna partly filled up the harbour, but spared the town, which was, however, almost entirely destroyed by the earthquake of 1693. Since that catastrophe it has been rebuilt, and has not further suffered from its proximity to Etna.

See A. Holm, Das alte Catania (Lübeck, 1873). (T. As.)

CATANZARO, a town and episcopal see of Calabria, Italy, capital of the province of Catanzaro, 1125 ft. above sea-level. Pop. (1901) 22,790 (town); 32,005 (commune). The station for the town (Catanzaro Sala) is situated on a branch line connecting the two main lines along the east and west coasts of Calabria, 6 m. N. by W. of Catanzaro Marina on the east coast, and 20 m. E. of S. Eufemia Biforcazione, on the west coast line. The town enjoys a comparatively cool climate in summer, and commands fine views. Numerous wealthy families reside here, and the town has a trade in olive-oil, silk and velvet. The castle, built by Robert Guiscard, has been modernized, and so has the cathedral. The see was founded in 1121. The provincial museum contains antiquities and especially coins from the ancient cities of Magna Graecia, and a few pictures.

CATAPULLI (Lat. catapulta, Gr. kattapullik), a generic name for warlike engines of the cross-bow type used by the ancients. Although engines of war appear on Assyrian remains, and are mentioned in 2 Chronicles xxvi. 15, it appears that Greek armies, even of the 5th century, did not possess them, and the first record of a large siege train in classical literature is of the year 399 B.C., when Dionysius I. of Syracuse, contemplating an expedition against Carthage, provided himself with engines. From Sicily siege engines found their way some years later into Greece, and were first used by Macedon at the siege of Byzantium in 340, and thereafter, as a natural consequence of the regularizing or professionalizing of armies, artillery, as we may call it, came into prominence and called into existence technical corps to work it.

The war engines of the Romans, during the republic and early principate, are of the same type as those of Alexander’s successors in Greece. They are usually classed as (a) catapults and (b) ballistae (λιθοβόλοι). The former were smaller and were used with arrows for what is now called direct fire (i.e. at low angles of elevation); the latter were large siege engines discharging heavy bolts or stones at a high angle of elevation, like the modern howitzer. They were, of course, principally siege engines, but the smaller natures of catapult appear in field warfare from time to time, and eventually, during the early principate, they are found as part of the regulation equipment of infantry units. War engines were generally constructed on the same principle.

The essential parts of the catapult (see illustration) were the frame, the propelling gear, the trough (corresponding to the modern barrel) and the pedestal. The frame consisted of two horizontal beams forming top and bottom sills, and four strong upright bars mortised into them. The three open spaces or compartments, resembling narrow windows, between these four uprights carried the propelling and laying gear. The propelling gear occupied the two outer “windows.” In each a thick skein of cord or sinew was fastened to the top and bottom sills and tightly twisted. Two stiff wooden arms were inserted in the two skeins, and a specially strong bowstring joined the tips of these arms. In the middle compartment was the hinged fore-end of the trough, which was at right angles to the frame and at the back of it. The trough could be laid for elevation by a movable prop, the upper end of which was hinged to the frame while the latter ran up and down a sort of trail fastened to the pedestal. The whole equipment was laid for “line” by turning the frame, and with it the trough, prop and trail by a pivot in the head of the pedestal. Sliding up and down in the trough was a block, fitted with a trigger mechanism, through which passed the middle of the bowstring. The pedestal was a strong and solid upright resting upon, and strutted to, a framework on the ground; its upper end, as mentioned above, took the pivot of the frame and the head of the trail.
CATARACT—CATASTROPHE

On coming into action the machine was laid for direction and elevation. The block and with it the bowstring was next forced back against the resistance of the twisted skeins to the rear end of the trough, this being effected by a windlass attachment. The trigger being then pressed or struck with a hammer, the bowstring was released from the block, the stiff arms were violently brought back to the frame by the untwisting of the skeins, and the arrow was propelled through the centre "window" with great velocity. A small machine of the type described weighed about 85 lb, and sent a "three-span" (26-in.) arrow weighing ½ lb at an effective man-killing velocity somewhat over 400 yds.

The ballista was considerably larger and more expensive than this. In Scipio's siege train, at the attack of New Carthage (Livy xxvi. 47. 5), the number of the ballistae was only one-sixth of that of the catapults. In the ballista the rear end of the trough (which projected in front of the frame) always rested upon the ground, or rather was fixed to the framework of the pedestal—which was a heavy trestle construction—and the trough was thus restricted to the angle of elevation, giving the maximum range (45°). Even so the range was not appreciably greater than that of a catapult, and in the case of the largest ballistae (ninety-pounder) it is possible that the name of "catapult" has also been given to a bowling machine which is used for cricket practice.

CATARACT (from the Lat. forma cataracta of the Gr. καταρράκτης, a floodgate, or waterfall, properly something which rushes down), a downpour of water, a waterfall. The earliest use in English is of a floodgate or portcullis, and this survives in the name of a disease of the eye (see EYE: Eye Diseases), in which the crystalline lens becomes opaque, and forms an apparent grating over the eye. The term is also used of a device to regulate the strokes in certain types of steam-engine.

CATARGIU (or CATARGI), LASCAR (1823-1860), Rumanian statesman, was born in Moldavia in November 1823. He belonged to an ancient Walachian family, one of whose members had been banished in the 17th century by Prince Matthew Basarab, and had settled in Moldavia. Under Prince Gregory Ghica (1849-1856), Catargiu rose to be prefect of police at Iassy. In 1857 he became a member of the Divan ad hoc of Moldavia, a commission elected in accordance with the treaty of Paris (1856) to vote on the proposed union of Moldavia and Walachia. His strongly conservative views, especially on agrarian reform, induced the Government of Prince Constantin Movilă to dismiss him for the throne in 1859. During the reign of Prince Cuza (1859-1860), Catargiu was one of the Opposition leaders, and received much assistance from his kinsman, Barbu Catargiu (b. 1807), a noted journalist and politician, who was assassinated at Bucharest on the 20th of June 1862. On the accession of Prince Charles in May 1866, Lascar Catargiu became president of the council, or prime minister; but, finding himself unable to cooperate with his Liberal colleagues, I. C. Brătianu and C. A. Rosetti, he resigned in July. After eight more ministerial changes, culminating in the anti-dynastic agitation of 1870-1871, Catargiu formed, for the first time in Rumanian history, a stable Conservative cabinet, which lasted until 1876. His policy, which averted revolution and prevented the popularity of the Crown, was regarded as unpatriotic and reactionary by the Liberals, who resumed office in 1876; and a proposal to impeach the whole Catargiu cabinet was only withdrawn in 1878. Catargiu remained in opposition until 1889, when he formed another cabinet, taking the portfolio of the Interior; but this administration fell after seven months. In the Florescu ministry of March 1891 he occupied the same position, and in December he again became president of the council, retaining office until 1895. During this period he was responsible for several useful reforms, chiefly financial and commercial. He died suddenly at Bucharest on the 11th of April 1899.

CATARRH (from the Gr. κατάρρη, to flow down), a term principally employed to describe a state of irritation of the mucous membrane of the respiratory passages, or what is called in popular language a "cold." It is the result of infection by a micro-organism in one or more of various predisposing conditions, damp, chill, fatigue, &c. The complaint usually begins as a nasal catarrh or coryza (Gr. κόρης, head), with a feeling of weight about the forehead and some degree of difficulty in breathing through the nose. Fits of sneezing accompanied by a profuse watery discharge from the nostrils and eyes soon follow, while the sense of smell and to some extent that of taste become considerably impaired. There is usually present some amount of sore throat and of bronchial irritation, causing hoarseness and cough. Sometimes the vocal apparatus becomes so much inflamed (laryngeal catarrh) that temporary loss of voice results. There is always more or less feverishness and discomfort, and frequently an extreme sensitivity to cold. After two or three days the symptoms begin to abate, the discharge from the nostrils and chest becoming thicker and of purulent character, and producing when dislodged considerable relief to the breathing. On the other hand the catarrh may assume a more severe aspect and pass into some form of pulmonary inflammation (see BRONCHITIS) or influenza (q.v.).

When the symptoms are first felt it is well to take a good purge, and to encourage free perspiration by a hot bath, some diaphoretic drug, as spirits of nitrous ether, being taken before retiring. A good hot bath is an essential part of treatment, and a good snuff is still pin their faith to a dose of Dover's powder. When the cough manifests itself by aches and pains in back and limbs aspirin taken three or four times in the first twenty-four hours will often act like magic. Locally a snuff made of menthol 1 part, ammonium chloride 3 parts and boracic acid 2 parts will relieve the discomfort of the nose. Also, remembering the microbic origin of the disease, gargling and nasal syringing should be repeated at intervals. As soon as the attack shows signs of subsiding, a good tonic and, still better, a change of air are very helpful.

The term catarrh is used in medical nomenclature in a wider sense to describe a state of irritation of any mucous surface in the body, which is accompanied with an abnormal discharge of its natural secretion, hence the terms gastric catarrh, intestinal catarrh, &c.

See also RESPIRATORY SYSTEM: Pathology, and DIGESTIVE ORGANS: Pathology of.

CATARRHINE APE, the term used to describe those apes which have less brain development than the Anthropoids, the aperture pointing downward, and the nose projecting. Among the distinguishing features of both the lower "doglike" apes (Cynomorpha) and the higher "manlike" apes (Anthropomorpha). The Catarrhini are restricted entirely to the Old World, and include the gorilla, the chimpanzee, and orang-utan.

CATASTROPHE (Gr. καταστροφή, from καταστρέφειν, to overturn), a term of the ancient Greek drama for the change in the plot which leads up to the conclusion. The word is thus used of any sudden change, particularly of a violent or disastrous nature, and in geology of a cataclysm or great convulsion of the earth's surface.
CATAUÍ, a numerous cannibal tribe of South American Indians of the Purus river district, Brazil. They are a fine warlike race, with remarkably clear complexions and handsome features; round wrists and ankles they wear rings of twisted hair. They cultivate mandioc, and make pottery and bark canoes.

CATAWBA (from the Choctaw for “divided”), a tribe of North American Indians of Siouan stock; formerly the dominant people of South Carolina. Some of their divisions extended into North Carolina. They are now almost extinct, but were at one time able to send nearly 2000 “braves” into battle. In the American War of Independence they furnished a valuable contingent to the South Carolina troops. They then occupied a number of small towns on the Catawba river, but after wards leased their land and removed to the territory of the Cherokees, with whom they had been formerly at war. There, however, they did not long remain, but returned to a reservation in their original district. Their affinities have not been very clearly made out, and by Albert Gallatin they were grouped with the Cherokees, Choctaws, Muskgoes and Natchez. A vocabulary of sixty of their words was published by Horatio Hale in vol. ii. of the *Transactions of the American Ethnological Society* in 1849; and a much fuller list—a 300—collected by Oscar M. Lieber, the geologist, in 1856, made its appearance in vol. ii. of *Collections of the South Carolina Historical Society*, 1858. Of the one hundred Catawbas still said to be surviving a few, if any, claim to be full-blooded. They are in the Catawba Reservation in York county, South Carolina. The name is familiar in connexion with the white American wine, the praises of which have been sung by Longfellow. The grape from which the wine is obtained was first discovered about 1801, near the banks of the Catawba river, and named by Major Adlum in 1828, but it is now cultivated extensively in Illinois, Ohio and New York, and especially on the shores of Lake Erie.

See also *Handbook of American Indians* (Washington, 1897).

CATCH THE TEN, sometimes called Scotch Whist, a game played with a pack of 36 cards, from ace, king, queen to six in each suit, the ace being highest both in play and cutting. In trumps, however, the knave ranks highest. Any number from two to eight may play. If an even number, partners are cut for; if odd, each plays for himself. An odd number of players sit as they like; four players sit as at whist; six playing in two sides sit so that no two partners shall be next each other; six playing three sides sit so that two opponents shall divide each pair; eight are arranged in alternate pairs. After cutting, the cards are dealt according to the number of players. The last card is turned up and becomes the trump. If the trump is a six of spades it is usually omitted; when eight play, the four sixes are thrown out. The eldest head leads any card he chooses and all must follow suit if able, the penalty for a revoke being the loss of the game. The tricks are not kept separate but gathered in by one player for his side. At the end of the deal there are six hands of six cards on the table. The players first play out the first two hands, next the second two and finally the last two, the trump card remaining on the table until the first four hands are played out. The game is 41 points, the object of the play being to win the cards which have a special value. These are, with their values: knave of trumps 11, ace of trumps 4, king of trumps 3, queen of trumps 2, ten of trumps 10. All other cards have no counting value. As the ten can be taken by any other honour the object is to “catch the ten.”

CATECHISM (from Gr. κατηχέω, teach by word of mouth), a compendium of instruction (particularly of religious instruction) arranged in the form of questions and answers. The custom of catechizing, common to all civilized antiquity, was followed in the schools of Judaism and in the Early Church, where it helped to preserve the Gospel narrative (see CATECHUMENS). The catechism as we know it is intended primarily for children and uneducated persons. Its aim is to instruct, and it differs from a creed or confession in not being in the first instance an act of worship or a public profession of belief. The first regular catechisms seem to have grown out of the usual oral teaching of catechumens, and to have been compiled in the 8th and 9th centuries. Among them the work of Notker Labeo and of Kero, both monks of St Gall, and that of Ottfried of Weissenburg in Alsace deserve mention. But it is not until the first stirrings of the Reformation, which preceded the Reformation, that they became at all widespread or numerous. The Waldenses of Savoy and France, the Brethren (small communities of evangelical dissenters from the medieval faith) of Germany, and the *Unias Fratrum* of Bohemia all used the same catechism (one that was first printed in 1498, and which continued to be published till 1530) for the instruction of their children. It was based on St Augustine’s *Enchiridion*, and considers (a) Faith, *i.e.* the Creed, (b) Hope, *i.e.* the Lord’s Prayer, and (c) Love, *i.e.* the Decalogue.

The age of the Reformation gave a great stimulus to the production of catechisms. This was but natural at a time when the invention of printing had thrown the Bible open to all, and carried the word of religious opinion from the schools into the streets. The adherents of the “old” and the “new” religions alike had to justify their views to the unlearned as well as to the learned, and to give in simple formulas their reasons for the faith that was in them. Moreover, in the universal unrest and oversetting of all authority, Christianity itself was in danger of perishing, not only as the result of the cultured paganism of the Renaissance, but also through the brutal ignorance of the common folk, deprived now of their traditional religious restraints. To the urgency of this peril the Reformers were fully alive; and they sought its remedy in education. “Let the people be taught,” said Luther, “let schools be opened for the poor, let the truth reach them in simple words in their own mother tongue, and they will believe.”

Catechisms of the Chief Religious Communions.—(a) Evangelical (Lutheran and Reformed).—It was the ignorance of the peasantry, as revealed by the horrors of the Peasants’ War of 1524–25, and his pastoral visitation of the electorate of Saxony 1525–1527, that drew the above exclamation from Luther, and impelled him to produce his two famous catechisms (1529). In 1526 he had brought out a primer of religion dealing briefly with the Decalogue, the Creed and the Lord’s Prayer; and Justus Jonas, Johannes Agricola and other leaders had done something of the same kind. Now all these efforts were superseded by Luther’s Smaller Catechism meant for the people themselves and especially for children, and by his Larger Catechism intended for clergy and schoolmasters. These works, which did much to mould the character of the German people, were set among the doctrinal standards of the Lutheran Church and powerfully influenced the claims of the Smaller Catechism with the Augsburg Confession, was made the Rule of Faith in Denmark in 1537.

In this same year (1537) John Calvin at Geneva published his catechism for children. It was called Instruction and Concession of Faith for the Use of the Church of Geneva (a reprint edited by A. Riliet and T. Dufour was published in 1878), and explained the Decalogue, the Apostles’ Creed, the Lord’s Prayer and the Sacraments. Though it was meant, as he said, to give expression to a simple pietie rather than to exhibit a profound knowledge of religious truth, it was the work of a man who knew little of the child mind, and though it served as an admirable and transparent epitome of his famous Institutes, it was too long and too minute for the instruction of children. Calvin came to see this, and in 1542, after his experience in Strassburg, drafted a new one which was much more suitable for teaching purposes, though, judged by modern standards, still far beyond the theological range of childhood. It was used at the Sunday noon instruction of children, on which Calvin laid much stress, and was adopted and similarly used by the Reformed Church of Scotland. The Reformed churches of the Palatinate, on the other hand, used the Heidelberg Catechism (1562–1563), “sweet-spirited, experiential, clear, moderate and happily-phrased,” the main work of two of Calvin’s younger disciples, Kaspar Olevianus and Zacharias Ursinus. The Heidelberg Catechism, set forth by order of the elector, is perhaps the most widely accepted symbol of the Calvinistic faith, and is noteworthy for its
emphasis on the less controversial aspects of the Genevan theology. As revised by the synod of Dort in 1619, this catechism became the standard of most of the Reformed churches of central Europe, and in time of the Dutch and German Reformed churches of America. Other compilations were those of Oecolampadius (Basel, 1526), Leo Juda (Zürich, 1534), and Bul linger (Zürich, 1555). In France, after Calvin's day, the Reformed church used besides Calvin's book the catechisms of Louis Capell (1619), and Charles Drelincourt (1642), and at the present time Bonnefon's Nouveau Catechisme élémentaire (14th ed., 1900) seems most in favour. In Scotland both Calvin's Geneva Catechism and then the Heidelberg Catechism were translated by order of the General Assembly and annotated. In 1592 these were superseded by that of John Craig, for a time the colleague of John Knox at the High Church, Edinburgh.

Since 1648 the standard Presbyterian catechisms have been those compiled by the Westminster Assembly, presented to parliament in 1647, and then authorized by the General Assembly of the Church of Scotland (July 1648) and by the Scottish parliament (January 1649). The Larger Catechism is for such as have made some proficiency in the knowledge of the Christian religion, but is too detailed and minute for memorizing, and therefore is superseded by the Shorter Catechism, which is for such as are of weaker capacity. The work was done by a committee presided over first by Herbert Palmer, master of Queens', Cambridge, and then by Anthony Tuckney, master of Emmanuel. The scriptural proof texts were added at the request of the English parliament. In his negotiations with the parliament in 1648 Charles I. offered to license the printing of the catechism, but, as the negotiations were broken off, this was not done. The Shorter Catechism, after a brief introduction on the end, rule and essence of religion, is divided into two parts: I. The doctrines we are to believe (1) concerning the nature of God, (2) concerning the decrees of God and their execution—(a) in creation and providence, (b) in the covenant of works, (c) in the covenant of grace; II. The duties we are to perform (1) in regard to the moral law, (2) in regard to the gospel—(a) inward duties, i.e. faith and repentance, (b) outward duties as to the Word, the sacraments and prayer. It has 107 questions and answers, while that of the Anglican Church has but 24, grouping as it does the ten commandments and the two sacraments under the headings of doctrine and discipline. The Larger Catechism, closely associated as this has been from the first with Scottish public elementary education, has had very great influence in forming and training the character of Presbyterians in Scotland, America and the British colonies, it is, like most other catechisms drawn up by dogmatic theologians, more admirable as an epitome of a particular body of divinity than as an instruction for the young and the unlearned. Its use is now generally preceded by something more adapted to the child-mind, and this is true also in other communions and in the case of other catechisms.

(b) Roman Catholic.—There was no universal catechism published by the Latin Church before the council of Trent, but several provincial councils, e.g. in Germany and Scotland (where Archbishop Hamilton's catechism appeared in 1552 and was ordered to be read in church by the parish priest), moved in self-defence along the lines already adopted by the reformers. The council of Trent in 1563 resolved on an authoritative work which was finally carried through by two small papal commissions, and issued in 1566 by Pius V. The text, not revised, was printed in Dublin (1589). Being unaccountable in form and addressed to the clergy rather than to the people, it missed its intention, and was superseded by others of less exalted origin, especially by those of the Jesuit Peter Canisius, whose Summa Doctrinae et Institutionis Christianae (1554) and its shorter form (1556) were already in the field. The catechisms of Bellarmine (1603) and Bossuet (1687) had considerable vogue, and a summary of the former known as Schema de Paro was sanctioned by the Vatican council of 1870. But the Roman Catholic Church as a whole has never had any one official catechism, each bishop being allowed to settle the matter for his own diocese. In England the Roman Catholic bishops have agreed on the use of what is known as "The Penny Catechism," which is very lucid and well constructed.

(c) Orthodox Eastern Church.—Peter Mogila, metropolitan of Kiev, drew up in 1643 the Orthodox Confession of the Catholic and Apostolic Eastern Church. This bulwark against the encroachments of the Jesuits and the Reformed Church was standardized by the synod of Jerusalem in 1672. A smaller catechism was drawn up by order of Peter the Great in 1723. The catechisms of Levshin Platon (1762) and V. D. Philaret (1839), each in his day metropolitan of Moscow, are bulky compilations which cannot be memorized, though there is a short introductory catechism prefaced to Philaret's volume (Eng. trans. in Blackmore's Doctrine of the Russian Church, 1845). These works are not to any extent in the hands of the people, but are used by the Russian clergy and schoolmasters as guides in giving instruction. The Coptic and Armenian churches also have what H. Bonar describes as "mere pretences at catechisms."

(d) Anglican.—The catechism of the Church of England is included in the Book of Common Prayer between the Orders for Baptism and Confirmation, and is divided into two parts: (i) the Baptist form of the Creed, the Decalogue and the Lord's Prayer; in part (ii.) as drawn up probably by Cranmer and Ridley in the time of Edward VI., and variously modified between then (1549) and 1601; (ii.) the meaning of the two sacraments, written on the suggestion of James I. at the Hampton Court Conference in 1604 by John Overall, then dean of St Paul's, and afterwards bishop successively of Coventry and Lichfield and of Norwich. This supplement to what had become known as the Shorter Catechism established its use as against the longer one, King Edward VIth's Catechism, which had been drawn up in 1553 by John Ponet or Poynt, bishop of Winchester, and then revised and enlarged in 1570 by Alexander Nowell, Overall's predecessor as dean of St Paul's. The Anglican catechism with occasional modification, especially in the sacramental section, is used not only in the Church of England but in the Episcopal churches of Ireland, Scotland, the British dominions and the United States of America. By the rubric of the Prayer Book and by the 39th canon of 1663 the clergy are enjoined to teach the catechism in church on Sundays and holidays after the second lesson at evening or the first lesson at morning service. This catechism, which has largely been revised during recent years, the children going to church for a special afternoon service of which catechizing is the chief feature. Compared with the thoroughness of most other catechisms this one seems very scanty, but it has a better chance of being memorized, and its very simplicity has given it a firm hold on the inner life and conscience of devout members of the Anglican communion throughout the world.

(e) Other Communions.—Almost every section of the church, e.g. the Wesleyan Methodist, has its catechism or catechisms, but in addition to those already enumerated only a few need be mentioned. The Socinians embodied their tenets in the larger and smaller works drawn up by Fausto Sozzini and Schmalz, and published at Rakow in Poland in 1605; 2 modern Unitarians have modern catechisms. The Quakers or Friends possess a kind of catechism said to have been written by George Fox in 1660, in which father and son are respectively questioner and answerer, and an interesting work by Robert Barclay, in which texts of Scripture form the replies. Congregationalists for some time used a catechism for Children and Youth (1730), since superseded by the manuals of J. H. Stowell, J. H. Ridder and others. In 1808 the National Council of the Evangelical Free Churches in England and Wales published...
CATECHU—CATECHUMEN

507

an Evangelical Free Church Catechism, the work of a committee (convened by Rev. Hugh Price Hughes) comprising Congregationalists, Baptists, Methodists, Wesleyan, Primitive, and others), and Presbyterians, and thus representing directly or indirectly the beliefs of sixty or seventy millions of avowed Christians in all parts of the world, a striking example of inter-denominational unity. More remarkable still in some respects is The School Catechism, issued in 1907 by a conference of members of the Reformed churches in Scotland, which met on the invitation of the Church of Scotland. In its compilation representatives, and the book though "not designed to supersede the distinctive catechisms officially recognized by the several churches for the instruction of their own children," certainly "commends itself as suitable for use in schools where children of various churches are taught together."

Catechisms have a strong family likeness. In the main they are expositions of the Creed, the Lord's Prayer and the Decalogue, and thus follow a tradition that has come down from the days when Cyril of Jerusalem delivered his catechetical Lectures. Even when (as in the Shorter Westminster Catechism and the School Catechism) the Creed is simply printed as an appendix, or where (as in the Free Church Catechism) it is not mentioned at all, its substance is dealt with and discussed in these and it is no means constant. The Heidelberg and Westminster Catechisms are of a more logical and independent character. The former is based on the Epistle to the Romans, and deals with the religious life and doctrine of the church; the latter is a book of questions and answers respectively the sin and misery of man, the redemption wrought by Christ (here are included the Creed and the Sacraments), and the grateful service of the new life (the Decalogue).

It should be noted that Sir Oliver Lodge has adopted the catechetical form in his book, The Substance of Faith Allied with Science (1907), which is described as "a catechism for parents and teachers." See Ehrenfeucht, Geschichte des Ketzerschums (1857); P. Schaff, History of the Creeds of Christendom (3 vols., 1870-1872); Mitchell, Catechisms of the Second Reformation (1887); C. Achenel, Lehrbuch der prakt. Theologie (2 vols., 1868); L. Pullan, History of the Book of Catechisms (1900); R. A. Knox, Pastoral and Theological Books (1902), chs. III. and IV.; W. Beveridge, A Short History of the Westminster Assembly (1904), ch. x. (A. J. G.)

CATECHU, or CUTCH (Malay, kachu), an extract obtained from several plants, its chief sources being the wood of two species of acacia (A. catechu and A. suma), both natives of India. This extract is known as black catechu. A similar extract, known in pharmacy as pale catechu (Catechu pulchidum), and in general commerce as gambir, or terra japonica, is produced from the leaves of Uncaria gambir and U. acida, cinchonaceous plants growing in the East Indian Archipelago. A third product to which the name catechu is also applied, is obtained from the fruits of the areca or betel palm, Areca catechu.

Ordinary black catechu is usually imported in three different forms. The first and best quality, known as Pegu catechu, is obtained in blocks externally covered with large leaves; the second and less pure variety is in masses, which have been moulded in sand; and the third consists of large cubes packed in coarse bags. The wood of the two species of Acacia yielding catechu is taken for the manufacture when the trees have attained a diameter of about 1 ft. The bark is stripped off and used for tanning, and the trunk is split up into small fragments, which are often used as dyestuffs. When the wood of the extract has become sufficiently thick it is cast into the forms in which the catechu is found in commerce. Catechu so prepared is a dark brown, or, in mass, almost black, substance, brittle, and having generally a shining lustre. It is astringent, with a sweetish taste. In cold water it disintegrates, and in boiling water, alcohol, acetic acid and strong caustic alkali it is completely dissolved. Chemically it consists of a mixture of a peculiar variety of tannin termed catechu-tannic acid with catechin or catechusic acid, and a brown substance due to the alteration of both these principles. Catechu-tannic acid is an amorphous body soluble in cold water, while catechin occurs in minute, white, silky, needle-shaped crystals, which do not dissolve in cold water. A very minute proportion of quercetin, a principle yielded by quercitrin bark, has been obtained from catechu.

Gambir, which is similar in chemical composition to ordinary catechu, occurs in commerce in the form of cubes of about an inch in size, with a pale brown or yellow colour, and an even earthy fracture. For the preparation of this extract the plants above mentioned are stripped of their leaves and young twigs, and these are boiled down in shallow pans. The juice is strained off, evaporated, and when sufficiently concentrated is cast into small boxes, where, as it hardens and dries, it is cut into small cubes.

Gambir and catechu are extensively employed in dyeing and tanning. For dyeing they have been in use in India from the most remote period, but it was only during the 19th century that they were placed on the list of European dyeing substances. Catechu is fixed by oxidation of the colouring principle, catechin, on the cloth after dyeing or printing; and treated thus it yields a variety of durable tints of drabs, browns and olives with different mordants (see Dyeing). The principal consumption of catechu occurs in the preparation of fibrous substances exposed to water, such as fishing-lines and nets, and for colouring stout canvas used for covering boxes and portmanteaus under the name of tanned canvas. Black catechu is official in most pharmaceuticals except that of Great Britain, in which pale catechu is the official drug. The actions and uses of the two are similar, but black catechu is the more powerful. The dose is from five to twenty grains. Though the word Catechu compositus contains catechu and kino, and may be given in doses as large as ten grains, it is named. The drug has the actions and uses of tannic acid, but owing to the relative insolubility of catechu-tannic acid, it is more valuable than ordinary tannic acid in diarrhea, dysentery and intestinal haemorrhage.

CATECHUMEN (Lat. catechumenus, Gr. κατεχομένος, instructed, from κατέχειν, to teach orally), an ecclesiastical term applied to those receiving instruction in the principles of the Christian religion with a view to baptism. As soon as Christianity became a missionary religion, it was found necessary to make arrangements for giving instruction to new converts. At the beginning the Apostles themselves seem to have undertaken this duty, and the instruction was apparently given after baptism, for in Acts ii. 41, 42, we are told that "they that gladly received the word were baptized . . . and they continued stedfastly in the Apostles' teaching." There are two instances in the New Testament where reference is made to individual instruction in this technical sense. Luke (i. 4) in dedicating the third Gospel to Theophilus tells him, in writing the book was "that thou mightest have certainty in the things in which thou hast been instructed" (κατέχομενον), and we are told that Apollos was instructed (κατεχόμενον) "in the way of the Lord" (Acts xvii. 25).

With the development of Christianity the instruction became more definite and formal. It is probable that the duty of instructing converts was assigned to "the teachers," who are ranked by Paul immediately after the Apostles and prophets (1 Cor. xii. 28), and occupied an important position in the Christian ministry. In the Didache, or Teaching of the Apostles, we have an excellent illustration of the teaching which was given to candidates for baptism in early times. There can be little doubt that the Didache was used as a manual for catechumens for several centuries. Athanasius (Festal Epistles, 39), for instance, says that it was appointed by the Fathers to be read by those who are just recently coming to us, and wish to be instructed in the word of godliness (κατεχομένοι τον τῆς εὐαγγελίας λόγον). The instruction prescribed by the Didache is very largely ethical, and stands in striking contrast to the more elaborate doctrinal teaching which came into use later. The Shepherd of Hermas too is another book which seems to have been used for the purpose of catechesis, for Eusebius says that it "was deemed most necessary for those who have need of elementary instruction" (Eccles. Hist. ii. 3-6).

With the rise of theological controversy and the growth of heresy catechetical instruction became of vital importance to the Church, and much greater importance was attached to it. After the middle of the 4th century it was regarded as essential that the candidate for baptism should not only be acquainted
with the spiritual truths and ethical demands which form the basis of practical Christianity, but should also be trained in theology and the interpretation of the creeds. Two books have been preserved which throw a striking light upon the transformation which had taken place in the conception of catechesis: (1) the Catechetical Lectures of Cyril of Jerusalem; (2) the De rudibus Catechizandis of Augustine. Augustine’s treatise was written at the request of a catechist, named Deogratias, who had asked him for advice. After replying to the question of Deogratias, and giving sundry counsels as to the best method of interesting catechumens, Augustine concludes by giving a model catechetical lecture, in which he covers the whole of biblical history, beginning from the opening chapters of Genesis, and laying particular stress on the doctrinal parts of Scripture. Cyril and Augustine differ, as we should expect, in the doctrines which they select for emphasis, but they both agree in requiring a knowledge of sound doctrine on the part of the candidates.

In spite of the numerous references to catechumens in Patristic literature, our knowledge of the details of the system is often very deficient, and upon some points there is considerable diversity of opinion amongst experts. The following are the most important questions which come under consideration.

1. The Classification of Catechumens.—Bingham and many of the other writers held that there were four classes of catechumens, representing different stages in the process of instruction: (a) “The inquirers” (inquirentes) from the practice of Christianity, who were interested in attaining knowledge in order to make them desire further information, and who received private and individual instruction from the teachers before they were admitted into the second class. (b) “The hearers” (audientes), who were admitted into the school of the church by the practice of listening to sermons and instruction. (c) “The probationers” (probatori), who were completed during the period of probation and were deemed ready to receive baptism. Modern scholars, however, for the most part, hold that there is sufficient basis in the text for a more elaborate classification, and think that its advocates have confused the catechumenate with the system of penance. The evidence does not seem to warrant more than two classes, (a) the students, who were in the process of their training, and (b) the beneficiaries, who were qualified for baptism.

2. The Relation of Catechumens to the Church.—Catechumens were allowed of course to attend church services, but at a certain point in their instruction no further privileges were granted. The censure at which the dismissal took place could not be exactly determined, and it is not clear whether the catechumens were allowed to remain for a portion of the Communion service, and if so, whether as spectators only or as participants. The main point to be implied is that in some way they shared in the “Sacrament” which they (the catechumens) receive, though it be not the Body of Christ, is yet an holy thing and more holy than the common food which sustains us, because it is a Sacrament (De peccat. meritis, ii. 42). The explanation of these words has occasioned considerable controversy. Many scholars hold (and this certainly seems the most natural interpretation) that consecrated bread was taken from the communion vessels to the catechumens. Bingham, however, maintains that the reference is not to the consecrated bread, but to salt, which was given to them as a symbol that they might learn to purify and cleanse their souls from sin.

3. The Patristic Historical statements with regard to the duration of the catechumenical training are found in ecclesiastical authorities. The Apostolical Constitutions, for instance, fix it at three years; but this is the synod of Elvira at two. The references in the other authorities are only to that for practical purposes it was limited to the forty days of Lent. Very probably, however, the forty days of actual instruction were preceded by a period of probation.

4. The Relation between the Catechumenate and Baptism.—Catechetical instruction was designed as a preliminary to baptism. There were two directions, however, in which this purpose was enlarged: (a) We have no reason to suppose that when infant baptism was allowed the catechumens who were excluded from the catechumenal training, that instruction was deemed unnecessary in their case, though as a matter of fact we have no definite reference to their admission. The custom of post-baptismal instruction, which was very general in the 4th and 5th centuries, probably made such cases more rare than is generally supposed, and so accounts for the absence of any allusion to them in connexion with the catechumenate. (b) We have no reason to suppose that the instruction given in the famous catechetical schools of Alexandria and Carthage was restricted to candidates for baptism.

There is no doubt that “catechetical” is used in a much wider sense than it implied in this use of the English word. The instruction of the addresses of Cyril of Jerusalem. The “instruction” of Origen was given to all classes of Christians, and not merely to those who were in the initial stages.

5. Characteristics of the Catechumenal Training.—Besides in structure there were some other important features connected with the catechumenate. (a) The duty of confession was impressed on the candidates. (b) The ceremony of exorcism was often performed in order to free them from evil spirits. (c) At a certain point in the training, the first five Sacraments of the Church were delivered to the candidates by the bishop with much impressive ceremony. This teaching constituted the holy secret of mystery (disciplina arcani) of Christianity, and could only be imparted to those who were in the catechumenate. (d) The foundation of this arcanum was regarded as the most essential element in the catechetical discipline, and marked off its possessors from the rest of the world. There can be little doubt that this conception of the Holy Arca was one of the elements which was transferred from the catechumenate and baptism was derived from the same source.

AUTHORITIES.—Cyril, Catecheses; Gregory of Nyssa, Oratio carmen; Chrysostom, In Rom. Pent.; Augustine, De rudibus Catechizandis; Mayer, Geschichte des Catechumenates...in den ersten sechs Jahrhunderten (1868); S. Cheetham, The Mysteries, Pagan and Christian... (H. T. A.)

CATEGORY (Gr. κατηχόω, “accusation”); a term used both in ordinary language and in philosophy with the general significance of “class” or “group.” In popular language it is used for any large group of similar things, and still more generally as a mere synonym for the word “class.” The word was introduced into philosophy as a technical term by Aristotle, who, however, several times used it in its original sense of “accusation.” He also used the verb κατηχέω, to accuse, in the specific logical sense, to accuse...κατηχομενον...becomes the predicate; κατηχομενε...may be translated as affirmative proposition. But though the word thus received a new significance from Aristotle, it is not on that account certain that the thing it was taken to signify was equally a novelty in philosophy. In fact we find in the records of Oriental and early Greek thought something corresponding to the Aristotelian classification.

Our knowledge of Hindu philosophy, and of the relations in which it may have stood to Greek speculation, scarcely enables us to give decisive answers to various questions that naturally arise. But it may be well to quote a recent article by Richard Garbe in Monist, iv. 176-193. Yet the similarity between the two is so striking that, if not historically connected, they must at least be regarded as expressions of similar tendencies. The Greek has been more generally connected with the Greek system of philosophy, the categories of which may with truth be described as applications of simple terms, τὰ κατὰ μεθοδίαν συνηθεῖα διάδοσιν. The six categories of Kanada are Substance, Quality, Action, Genus, Individuality, and Conception or Co-inherence. To these are added Non-Existence, Privation or Negation, Satisfaction, and the four highest categories of which Qualities exist. Action, belonging to or inhering in substances, is which produces change, Genus belongs to the lower categories; there are higher and lower genera. Individuality, found only in bodies, is that by which a thing is self-existent and marked off from others. Conception or Co-inherence denotes inseparable or necessary connection, such as that between substance and quality. Under these six classes, the five 5th, 6th, and 7th, Kanada, from which, as we shall see, the Grecian system proceeds, were derived by means of the categories of the former.

Within Greek philosophy itself there were foreshadowings of the Aristotelian doctrine, but nothing so important as to warrant the conclusion that Aristotle was directly influenced by it. Doubtless the One and Many, Being, and the categories of Greek philosophy, Eleatic dialectic, with their subordinate oppositions, may be called categories, but they are not so in the Aristotelian sense, and have little or nothing in common with the later system. Their

1 Apost. constit. viii. 2. 2 Canon 42.
starting-point and results are wholly diverse. Nor does it appear necessary to do more than mention the Pythagorean table of principles, the number of which is supposed to have given rise to the decuple arrangement adopted by Aristotle. The two classifications have a certain common; no term in the one list corresponds to any term in the other; and there is absolutely nothing in the Pythagorean principles which could have led to the theory of the categories.  

One naturally turns to Plato when endeavouring to discover the genesis of the two classifications. Yet, as if we wish to neglect the Platonic writings many detached discussions in which the matter of the categories is touched upon. Special terms are also anticipated at various times, e.g. "tousm in the Theaetetus, πους and παρακια in the Gorgias, and ἀρνητικο-λογικός in the Parmenides, to which one could say gave occasion directly and of itself to the Aristotelian doctrine; and even when we take a more comprehensive view of the Platonic system and inquire what it corresponds to the widest diverse doctrine the thought of a classification which will receive no very definite answer. The Platonic dialectic never worked out into system, and in only two dialogues do we get anything like a list of ultimate or root-entities. In the Sophists, Being and the Beginning, and kai Evans of pin are laid down as μέγιστα τῶν ἔρων. To these are presently added the Same and the Other (τὸ τοῦ καὶ τὸ ἄλλο), and out of the consideration of all five some light is cast upon the obscure notion of Πρότικες. In the same work (7 sec.) is found the expression of important distinction of ἀνδρακι and ἀνεμος, noun and verb. The Philebus presents us with a totally distinct classification into four elements—the Infinite, the Finite, the Mixture or Unity of both and the Unmixed. Here, for once, we have a clear example of the confusion which Aristotle’s doctrine is to make. It is at once apparent that, however these classifications are related to one another and to the Platonic system, they lie in a different field from that occupied by the Aristotelian categories, and can have nothing to do with the task in hand.

The Aristotelian doctrine is most distinctly formulated in the short treatise Κατηγορια, which generally occupies the first place among the books of the Οργανος. The authenticity of the treatise was doubted in early times by some of the Aristotelian scholars, and a part of it has been revived by such scholars as L. Spengel and Carl Prantl. On the other hand, C. A. Brandis, H. Bonitz, and Ed. Zeller are of opinion that the tract is substantially Aristotle’s. The matter is hardly one that can be decided either by the text itself or by the archeology of the questions. But it is certain that the doctrine of the categories, even of the ἔναν λόγος, does not stand or fall with only one portion of Aristotle’s works.

It is surprising that there should yet be so much uncertainty as to the fundamental principles of the doctrine of the categories, or even to say what is the system of these sciences is nearly complete ignorance as to the process of thought by which Aristotle led to the doctrine. On both points it is difficult to extract from the matter before us anything approaching a satisfactory answer. Only just one thing emerges from our discussion, and that is that the connexion of these words into which Being as such may be divided, that they are summa genera. The expressions γένεσις τῶν κατηγοριών and σχήματα τῶν κ., which are used frequently, seem to lead to another and somewhat different idea, but if the discussion be not taken too literally, the connexion, γένεσις τῶν κ., would signify the most general classes of predicates, the framework into the divisions of which all predicates must come. To this interpretation there are objections. The categories must be carefully distinguished from the objects of the categories, or in other words, the objects of the categories are not the same as the objects of the categories. The one denotes real, the other logical connexion. Further, the categories cannot without careful explanation be defined as predicates; they are this and something more. The most important categories are sometimes parallel in their connexion. One may say, for instance, that being is a primary category, and that the connexion of the primary category is to a secondary category. Being is to be thought of as the connexion of primary and secondary categories, and that this connexion is a logical one. The category of Substance, which is defined to be τὸ ἔθνος, the singular thing in which properties inhere, and to which predicates are attached, and ἐποίημα

The supposed origin of that theory of the treatise τὸ ποιεῖν p. 254 D. 4

1 Against this passage even Prantl can raise no objection of any moment; see Ges. d. Logik, I. 206 n.

2 Bonitz, Index Aristotelici, s.v.; and Prantl, Ges. d. Logik, I. 207.

3 Seph. 254 d.

4 See Bonitz, Index Aristotelici, s.v., and Prantl, Ges. d. Logik, I. 207.

5 K. p. 3 b 12, 13. It is this doctrine of τὸ ποιεῖν or τὸ ἐποίημα which has been most widely adopted. But the tenfold classification, which has also been captiously objected to, is given in an acknowledged writing of Aristotle’s (see Topica, i. 9, p. 103 b 20). At the same time it is at least remarkable that the same list should be adopted by another, so early, and it is he regarded his list as complete, and he uses phrases which would seem to indicate that the division had been exhaustively carried out. He admits certainly that some predicates which come under one category might be referred to another, but he declines to define all from one highest class, or to recognize any relation of subordination among the several classes.

The full import of the categories will never be adequately reached from the above list, but it can be seen by the Kategorielehre, which bears the marks of an early and preliminary study. For true understanding we must turn to the Metaphysics, where the doctrine is handled at large. The discussion of Being in that work starts with a distinction that Aristotle makes between the two kinds of Being, ὁδὸς and ἄλογος. These four are classified—as do καταμετρήσεως, as, αὐτός ὁ ἄλογος, the ἄλογος and ὁ ἄλογος, as ἄλογος, as, and ἀλογος. It is evident from this that the categories can be regarded as a hierarchy, if we are to adopt Aristotle’s own usage. They indicate the general forms or ways in which Being can be predicated; they are determinations of Being regarded as an object of thought, and consequently as matters of speech. It becomes clear; then, that our task is to determine in what way, and as a singular thing, it is the primary form under which all that is becomes object of knowledge, and the other categories modify or qualify this real individual. Πάντα δὲ τῶν γενεσιῶν τοῦ τούτον γενεσίαν καὶ τοῦ τούτον καὶ τοῦ τούτον. It is the end of education to complete the list of all the categories, therefore, are not logical forms, but real predicates; they are the general modes in which Being may be expressed. The definite thing, that which comes forward in the process from potential into actual, from possibility into necessity, from the moment, is real individuality, quality, quantity, and so on. The nine later categories all denote entity in a certain imperfect fashion.

The categories then are not to be regarded as heads of predicates, but as the further base on which new predicates can be thrown. They are real determinations of Being—allegemeine Bestimmtheiten, as Hegel calls them. They are not summa genera of existences, still less are they to be explained as a classification of names things in general. Their function is rather to determine in what way something may be a thing, and would only have significance if the categories were really—what they are not—an exhaustive division of concrete existences.

Grote’s view (Aristotle, i. 108) that Aristotle drew up his list by examining the definitions given by his predecessors, and then arranged them in the syllogism he thought the categories of one into genera, “according as they stood in different logical relation to the subject,” has no foundation. The relation of the predicate category to the subject is not entirely a logical one; it is a relation of essential identity, and wants the essential marks of the propositional form. The logical relations of τὰ ὑπ’ are provided for otherwise than by the categories.

Aristotle has given no intimation of the course of thought by which he arrived at his final arrangement, and it seems hopeless to discover it. Trendelenburg in various essays has worked out the idea that the root of the matter is to be found in grammatical considerations, that the categories originated from investigations into grammatical functions, and that a correspondence will be found to obtain between the categories and grammatical functions. This is a theory which corresponds to noun substantive, Quantity and Quality to the adjective, Relation partly to the comparative degree and perhaps to the preposition, When and Where to the adverb of time and place, Action and to the nominative, Possession of things and to the possessive, Order to the intransitive verb, ἐπεξεργάζεσθαι to the peculiar Greek perfect. That there should be a very close correspondence between the categories and grammatical elements is by no means surprising; that the one is from the other, and the other is from the one, is both historically and historically improbable. Reference to the detailed criticisms of Trendelenburg by Ritter, Bonitz, and Zeller will be sufficient.

Aristotle has also left us in doubt on another point. Why should the word κατηγορία be divided? In the Aristotelian categories the want of a principle, and yet some of Aristotle’s expressions would warrant the inference that he had a foundation for his arrangement. And there is a leading idea of all later attempts at reduction to unity of principle,
the division into substance and accident, was undoubtedly not overlooked by Aristotle, and Fr. Brentano ¹ has collected with great diligence passages which indicate how the complete list might have been deduced from this primary distinction. His tabular arrangements of the Stoiics and the systems of other philosophers prove his preoccupation with it. The results, however, are hardly beyond the reach of doubt.

There was no fundamental change in the doctrine of the categories from the time of Aristotle to that of Kant, and only two proposed systems are here of importance to notice. The Stoics adopted a fivefold arrangement of highest classes, genesis, etc. To be, or some-what in general, was subdivided into τρόπωσις or subjects, ποίησις or active divine or creative activity, etc., of which four modes only the subject, διάφορος τι, are definite relative modes. These categories are so related that each involves the existence of one higher than itself, thus there cannot exist a category such as that which does not rest upon or imply a pατὸς ἢ, but πατὸς ἢ is impossible without ποιητόν, which only exists in ἐποιείταιον, a form or phase of τὸ ἢ.

Plotinus, after a lengthy critique of Aristotle's categories, sets out a twofold list. τὸ ἢ, ποιητόν, στάσεις, στάσεως, the primitive categories (πατὸς ἢ), the intelligible sphere, ἐποιείταιον, ποιητόν, στάσεως, τῶν κατηγοριών are the categories of the sensible world. The return to the Platonic classification will not escape notice.

Modern philosophy, neglecting altogether the dry and tasteless treatment of the Aristotelian doctrine by scholastic writers, gave a new, a wider and deeper meaning to the categories. They now appear as ultimate or root notions, the metaphysical foundation of all the logical or thought elements, which give coherence and consistency to the material of knowledge, the necessary and universal relations which obtain among the particulars of experience. There was thus to some extent a return to Platonism, but in reality, as modern philosophy is based on a new technique of thought, there are some anticipations in kind of these old thinkers. The Substance, Attribute and Mode of Cartesianism can hardly be classed among the categories; nor does Leibnitz's chance suggestion of a fivefold arrangement into Substance, Quantity, Quality, Relation, modus, and modes, receive due notice. Locke, too, has a classification into Substances, Modes and Relations, but in it he has manifestly no intention of drawing up a table of categories. What in his system corresponds most nearly to the modern notion of the elements in rational cognition, the primitive categories (πατὸς ἢ), are the intelligible sphere, ἐποιείταιον, ποιητόν, στάσεως, the categories of the sensible world. The return to the Platonic classification will not escape notice.

These attempts at an exhaustive distribution of the necessary relations of all the logical or thought elements in modern thought, before it received its complete expression from Kant.

The doctrine of the categories is the very kernel of the Kantian system, and it is interesting to know that they appeared in the form in which we now have them only after much reflection. It is possibly the case that Kant himself hints more than once at the possibility of a completely rational system of the categories, at an evolution from one single movement of thought, and in his Remarks on the Table of the Categories (1822) he indicated by the language he used that there would be any complete realization of this suggestion Kant, however, was precluded by one portion of his theory. The categories, although the necessary conditions under which alone an object of experience can exist, are merely forms of the way in which the subject may apply only to sensuous and consequently subjective material. Outside of and beyond them lies the thing-in-itself, which to Kant represented the ultimately real. This subjectivism was a distinct influence on Fichte and Hegel, who, rejecting the primitive notion of categories, or pure conceptions, are contained all the modes of a priori synthesis. Kant directed criticism. It was manifest that at the root of the whole system of categories there lay the synthesizing unity of self-consciousness, and it was upon this unity that Fichte fixed as giving the possibility of a complete and negative reproduction of the pure notions of the understanding. Without the act of the Ego, whereby it is self-conscious, there could be no knowledge, and this primitive act or function must be, he said, the position or affirmation of itself by the Ego. The first principle then must be that the Ego posits itself as the Ego, that Ego = Ego, a principle which is unconditioned both in form and matter, and therefore capable of standing absolutely first, of being the prίtus in a system. Metaphysics regarded this act as the root from which all the branches of the doctrine of categories grow. Kant, however, contra Leibnitz, did not accept the principle.

Fichte.

Kant, it is well known, criticizes Aristotle severely for having drawn up his categories without a principle, and claims to have disclosed the only possible method by which an exhaustive classification might be obtained. What he criticized in Aristotle was the giving of a complete, universal, and necessary system, in which no two elements were equal, and which does not rest upon or imply a pατὸς ἢ, but πατὸς ἢ is impossible without ποιητόν, which only exists in ἐποιείταιον, a form or phase of τὸ ἢ.¹

¹ It does not seem necessary to do more than refer to the slight alterations made on Kant's Table of Categories by J. G. von Herder (in the Metaphysik), by Solomon Malmon (in the Propädeutik zu einer

2. For detailed examination of the Stoic categories, see Prantl, Ges. d. Logik, i. 428 sqq.; Zeller, Ph. d. Griech. iii. 1, 82, sqq.; Trendelenburg, Kateg. p. 217.
course, does not imply that there were not certain elements in Schelling, particularly in the Transcendental Idealism, that are of value in the transition to the later system; but on the whole it is only in Hegel that the whole matter of the Kantian categories has been assimilated and carried to a higher stage. The Hegelian philosophy, particularly in the works of Hegel himself, is not to be considered here to expound that philosophy, it is impossible to give more than a few general and quite external observations as to the Hegelian mode of viewing these elements of thought. With Kant, as has been seen, the categories are given as the general object of the whole system, and are treated as individual subject, but as having over against them the world of noumena to which they were inapplicable. Self-consciousness, which was, even with Kant, the nodus or kernel whence the categories sprang, was a mere element of his system, like sense, and the category was thus a dualism, to overcome which is the first step in the Hegelian system.

The principle, if there is to be one, must be universally applicable, all-comprehensive. Self-consciousness is precisely the principle wanted; it is the only one which is not a product of thought or as given in experience: (2) Property, either qualitative or quantitative; (3) Relation; (4) The Negated. Along with these posits be categories of inner process—(1) Sensation, (2) Cognition, (3) Will, (4) Action. Joh. Fr. L. George (cit. p. 373) has drawn a table of categories which shows, in some points, traces of herbertian influence. His arrangement by enneads, or series of nine, is fanciful, and wanting in inner principle.

The most imposing of more recent attempts at a reconstruction of the categories is that of F. A. Trendelenburg. To him the first principle, or primitive reality, is Motion, which is both real as external movement, and ideal as inner construction. Motion is the form of thought, and contains the forms of categories, which are both subjective and objective. From this point onwards are developed the mathematical (point, line, &c.) and real (causality, substance, quantity, quality, &c.) categories which appear as inseparable from motion. Motion is the condition of thought, or as product of motion; it is the condition of motion; we must think something moved. All these categories, "under the presupposition of motion as the first energy of thought, are ideal and subjective relations, as also, under the presupposition of motion as the first energy of Being, real and objective relations." A serious difficulty presents itself in the next category, that of End (Zweck), which can easily be thought for inner activity, but can hardly be reconciled with real motion. Trendelenburg solves the difficulty only empirically, by making of the insufficiency of the merely mechanical to account for the organic. The consideration of Modality effects the transition from the forms of thought. On the whole, Trendelenburg's unique fact of motion seems rather a blunder. There is much that is problematical here, and the whole system is by no means adequate to self-consciousness. His theory has found little favour.

Hermann Ulrici works out a system of the categories from the psychological or logical point of view. To him the fundamental fact of philosophy is the distinguishing activity (unter-scheidende Tätigkeit) of thought. Thought is only possible by distinction, difference. The fixed points in the relations of objects upon which thought is based is the category of forms; he called the forms the laws of thought. They are the aspects of things, notions under which things must be brought, in order to become objects of thought. They are thus the most general predicates or heads of categories. The categories cannot be completely gathered from experience, nor can they be evolved a priori; but, by attending to the general relations of thought and its purely indefinite matter, and by attending to what we must predicate in order to know being, we may attain to a satisfactory list. Such a list is given in great detail in the System der Logik (1852), and in a brief, precise form in the Compendium der Logik (2nd ed., 1872); it is in many points well deserving of attention.

The definition of the categories by the able French logician Charles Bernard Rennouvier in some respects resembles that of Ulrici. To him the primitive fact is Relation, of which all the categories are but forms. The categories, he says, are nothing else but relations, reducible through the mediation of a number of mental relations which determine its form and regulate its movements. His table and his criticism of the Kantian theory are both of interest. The criticism of Kant's categories by B. and Rennouvier is a good deal more general than the later

much more at the disposal of the human mind. Little more of value is the elaborate table drawn out by Sir W. Hamilton. The generalized category of the Compendium has but little meaning, and the subordinate categories evolve themselves by no means, but are arranged after a formal and quite arbitrary manner. They are never brought into connexion with thought itself, nor could they be shown to spring from its nature and relations. J. S. Mill presented, "as a substitute for the abortive classification of the thing A. F. Mill, Principles of logic (1843)," the following as an enumeration of all nameable things—(1) Feelings, or states of consciousness; (2) The minds which experience these feelings; (3) Bodies, or external objects which excite certain of these feelings; (4) Successions and co-existences, likenesses and unlikelinesses, between things. This classification proceeds on a quite peculiar view of the categories, and is here presented only for the sake of completeness.

By modern psychologists the subject has been closely investigated. Modern psychologists, vol. ii., pp. 312 (fol.) defines categories as "forms of cognitive consciousness, universal principles or relations presupposed either in all cognition or in all cognition of a certain kind." He then proceeds—"that the idea of a 'Causality' and 'Thinghood' from the standpoint of the perceptual consciousness; showing in what sense the categories of causality, substance and the rest exist in the sphere of perception. As contrasted with the idea of a 'Causality' and 'Thinghood' in the standpoint of the perception tells the child of things as separate entities, not in their ultimate relations as parts of a coherent whole. G. T. Ladd (Psychology Descriptive and Explanatory, ch. xxi., on The Mind of the Child) has already been described. Modern psychology stands as 'those highly abstract conceptions which the mind frames by reflection upon its own most general modes of behaviour. They are our own notions resulting from co-operation of imagination and judgment, concerning the ultimate and unanalyzable forms of a naturalistic conceptions as formed in other men. In other words, the categories are highly abstract, have no content, and are realized as a kind of thinking which has for its object all the other mental processes."

Catenary (from Lat. catena, a chain), in mathematics, the curve assumed by a uniform chain or string hanging freely between two supports. It was investigated by Galileo, who erroneously determined it to be a parabola; Jungius detected Galileo's error, but the true form was not discovered until 1691, when James Bernoulli published it as a problem in the Acta Eruditorum. Bernoulli also considered the cases when (1) the chain was of variable density, (2) extendible, (3) acted upon at each point by a force directed to a fixed centre. These curves are called pseudoparabolas, and were discovered by John Bernoulli, Leibnitz, Huygens, David Gregory and others.

CATERAN—CAT-FOSS

The mechanical properties of the curves are treated in the article Mechanics, where various forms are illustrated. The simple catenary is shown in the figure. The catenary equation referred to the axis and directrix is \( y = c \cosh(x/c) \) or \( y = f(\cosh x) \); other forms are \( y = c \sinh(x/c) \) and \( y = f(\sinh x) \), where \( c \) being the arc measured from the vertex; the intrinsic equation is \( s = c \tan \psi \). The radius of curvature and normal are each equal to \( c \sec \psi \).

The form produced by revolving the catenary about its directrix is called the tractrix. It is a minimal surface, i.e., the catenary solves the problem: to find a curve joining two given points, with its normal at every point equal to a given line. The curve produced by revolving a line co-planar with the points traces a surface of minimum area (see Variations, Calculus of). The involute of the catenary is called the tractrix, tractricix or antifriciton curve; it has a cusp at the vertex of the catenary, and is asymptotic to the directrix. The catenary equation is

\[ x = \sqrt{c^2 - y^2} + \frac{\log(y + \sqrt{c^2 - y^2})}{\cosh(x/c)} \]

and the curve has the geometrical property that the length of its tangent is constant. It is named antifriciton curve, since a pivot and step having the form of the surface generated by revolving the curve about its vertical axis wear away equally (see Mechanics: Applied).

CATERAN (from the Gaelic cethamaha, a collective word meaning "peasantry"), the band of fighting men of a Highland clan; hence the term is applied to the Highland, and later to any, marauders or cattle-lifters.

CATERHAM, an urban district in the Wimbledon Parliamentary division of Surrey, England, 20 m. S. of London by the South-Eastern & Chatham railway. Pop. (1901) 9486. It lies in a healthy, hilly district, and has grown in modern times from a village into a large residential town. There are large barracks in the neighbourhood, and the Metropolitan lunatic asylum is close to the town.

CATERPILLAR, the popular name of the larva of various insects, particularly of butterflies and moths (see Lepidoptera, Hexapoda, Metamorphosis). The word appears first in the form caterpil (Promptorium Paradisi, March 1601). It is named from the act of caterpillar, i.e., the larva of a spider (q.v.), being a name applied to the hairy caterpillar, and also according to Congrave to a weevil. The use of "cat" in this connexion is paralleled by the Swiss name for a caterpillar, teufelskatz, and the popular English name for the blossom of the willow, "cattin," somewhat resembling a caterpillar (cf. "palmer"); the modern French is chenille, Latin canicula, a little dog. The termination of the word seems to have been early connected with "pillar," a robber, plunderer from the destructive habits of the larva, cf. Joel i. 4—"That which the palmier-worm hath left, hath the locust eaten." The spelling "caterpillar," a 17th century corruption, has been the usual form since Johnson.

CATESBY, ROBERT (1573–1663), English conspirator, son of Sir William Catesby of Lapworth in Warwickshire, a prominent recusant who was a descendant of Sir William Catesby, speaker of the House of Commons in 1484, who was executed by Henry VII. after the battle of Bosworth, was born in 1573, and entered Gloucester Hall (now Worcester College), Oxford, in 1586. He possessed a considerable estate, and was said to be wild and extravagant in his youth. In 1596 he was one of those arrested on suspicion during an illness of Queen Elizabeth. In 1601 he took part in the rebellion of Essex, was wounded in the fight and imprisoned, but finally pardoned on the payment of an enormous fine, to obtain which he was forced to sell a portion of his property. In 1602 he despatched Thomas Winter and the Jesuit Temidorus alias Greenway to Spain to induce Philip III. to organize an invasion of England, and in 1603, after James's accession, he was named as an accomplice in the "Bye Plot." Catesby was a bellicose man, the height of his person, he above 2 yards high, says Father Gerard, "and though slender, yet as well-proportioned to his height as any man one should see." He possessed a clear head and unflinching courage, and with a strong determination and fascinating manner mastered the minds of his associates and overpowered all opposition. He was, however, headstrong, wilful and imprudent, fit for action, but incapable of due deliberation, and entirely wanting in foresight. Exasperated by his personal misfortunes and at the repressive measures under which his co-religionists were suffering, and blinded by a religious zeal which amounted to fanaticism, he was now to be the chief instigator of the famous Gunpowder Plot, which must in any event have brought disaster upon the Roman Catholic cause. The idea of some great stroke seems to have first entered his mind in May 1603. About the middle of January 1604 he imparted his scheme of blowing up the Parliament House to his cousin Thomas Winter, subsequently taking in Guy Fawkes and several other conspirators and overcoming all fears and scruples. But it was his determination, from which he would not be shaken, which allowed warning to be given to the Roman Catholic peers that were to take part in the plot of November the 5th. A fatal mistake had been made in imparting the secret: Francis Tresham (q.z.), in order to secure his financial assistance, and there is scarcely any doubt that he was the author of the celebrated letter to his brother-in-law, Lord Montague, which betrayed the conspiracy to the government, on the 26th of October. On receiving the news of the letter on the 28th, Catesby exhibited extraordinary coolness and fortitude, and refused to abandon the attempt, hoping that the government might despise the warning and still neglect precautions; and his confidence was strengthened by Fawkes's report that nothing in the cellars had been touched or tampered with. On the 2nd of November his resolution was shaken by Tresham's renewed entreaties that he would flee, and his positive assurance that Salisbury knew everything. On the evening of the 3rd, however, he was again, through Percy's insistence, persuaded to stand firm and hazard the great stroke. The rest of the story is told in the article Gunpowder Plot. Here it need only be said that Catesby, after the discovery of the conspiracy, fled with his accomplices, taking refuge ultimately at Holbeche in Staffordshire, where he was apprehended and executed the 28th of November, he was over-taken and killed. He had married Catherine, daughter of Thomas Leigh of Stoneleigh, Warwickshire, and left one son, Robert, who inherited that part of the family estate which had been settled on Catesby's mother and was untouched by the attainder, and who is said to have married a daughter of Thomas Percy.

CAT-FISH, the name usually applied to the fishes of the family Siluridae, in allusion to the long barbels or feelers about the mouth, which have been compared to the whiskers of a cat. The Siluridae are a large and varied group, mostly inhabitants of fresh waters; some of them by their singular form and armature are suggestive of the Devonian milled fishes, and were placed at one time in their vicinity by L. Agassiz. Even such authorities as T. H. Huxley and E. D. Cope were inclined to assign ganoid affinities to the Siluridae; but this view has gradually lost ground, and most modern ichthyologists, if not all, have adopted the conclusions of M. Sagemahl, who has placed the Siluridae near the carp's and Characinids in the group Ostariophysi. The Siluridae, like all of their kin, are divided into two parallel series derived from some common stock which cannot have been very different from the existing Characinids. In spite of the archaic appearance of some of its members, the family Siluridae does not appear to extend far back in time, its oldest known representative being the Buchlaniidium dilusii of the Lower Eocene (London Clay) of Sheppey. A great number of forms were placed by Cuvier and his successors in the family Siluridae, which has since been broken up by T. Gill and other American authors into several families, united under the name of Nemato- gathini. A middle course appears the more reasonable to the
present writer, who has divided the Siluridae of Cuvier into three families, with the following definitions:

Siluridae—ribs attached to strong paraphyses; operculum well developed.

Loricaridae—ribs sessile; paraphyses absent; operculum more or less developed.

Aspredinidae—ribs sessile; strong paraphyses; operculum absent.

These three families may be defined among the Ostariophysii by having the parietal bones fused with the supraoccipital, no symplectic, the body naked or with bony scutes, the mouth usually toothed, with barbels, and usually an adipose dorsal fin.

The Siluridae embrace more than one thousand species, spread over the fresh waters of all parts of the world, but mostly from between the tropics. They are absent from western Europe and north-west Africa, and from North America west of the Rocky Mountains, but this deficiency has been made good by the introduction of Amia nebulosus and allied species in various parts of continental Europe and California having proved a success. Only a few forms are marine (Plecostus, Arius, Galeichthys).

The species which has given the name to the whole family is the "Wels" of the Germans, Silurus glanis, the largest European fresh-water fish, inhabiting the greater part of Europe from the Rhine eastwards and north of the Alps. Its head is large and broad, its mouth wide, furnished with six barbels, of which those of the upper jaw are very long. Both jaws and the palate are armed with broad bands of small closely-set teeth, which give the bones a rasp-like appearance. The eyes are exceedingly small. The short body terminates in a long, compressed, muscular tail, and the whole fish is covered with a smooth, scaleless, slippery skin. Specimens of 4 and 5 ft. in length, and of 50 to 80 lb. in weight, are of common occurrence, and the fish grows to 10 ft., with a weight of 400 lb., in the Danube. Its food consists chiefly of other bottom-feeding fishes, and in inland countries it is considered one of the better class of food fishes. Stories about children having been found in the stomach of very large individuals are probably inventions. An allied species (S. aristus) is found in Greece.

The Claris and Heterobranchus of Africa and south-eastern Asia have an elongate, more or less oval-shaped body, with long dorsal and anal fins, and are known to be able to live a long time out of water, being provided with an accessory dentritic breathing organ situated above the gills. Some species live in burrows during the dry season, crawling about at night in search of food. The common Nile species, the "Harmoot" (Claris lazera), occurs abundantly in the Lake of Galilee and was included in, if not chiefly aimed at, by the Mosaic law which forbade the Jews to eat scaleless fishes, a prohibition which has been extended to eels in spite of the obvious presence of minute scales in the latter.

The Saccobranchus of India and Ceylon, a genus more nearly related to Silurus, have also an accessory organ for breathing atmospheric air. It consists of a long sac behind the gill-cavity, extending far back on each side of the body under the muscles.

In the majority of the Siluridae, called by A. Günther the Proteocephala, a section extremely numerous in species, and represented throughout the tropics, the dorsal fin consists of a short-rayed and an adipose portion, the former belonging to the abdominal vertebral column; the anal is always much shorter than the tail. The gill-membranes are not confluent with the skin of the isthmus; they have a free posterior margin. When a nasal barbel is present, it belongs to the posterior nostril. This section includes among many others the genus Bagrus, of which the bayad (B. bayad) and docmac (B. docmac) frequently come under the notice of travellers on the Nile; they grow to a length of 5 ft. and are eaten.

Of the "cat-fishes" of North America (Amiaurus), locally called "bull-heads" or "horned-pouts," with eight barbels, some twenty species are known. Some of them are valued as food, especially one which is abundant in the ponds of New England, and capable of easy introduction into other localities (A. nebulosus). Others which inhabit the great lakes (A. migricans) and the Mississippi (A. ponderosus) often exceed the weight of 100 lb. Plecostoma and Pimelodus people the rivers and lakes of tropical America and Africa of them are conspicuous in this fauna by the ornamentation of their body, by long spartulate snouts, and by their great size.

The genus Arius is composed of a great number of species and has the widest distribution of all Silurids, being represented in almost all tropical countries which are drained by large rivers. Most of the species live in salt water. They possess six barbels, and their head is extensively osseous on its upper surface; their dorsal and pectoral spines are generally developed into powerful weapons. Bagarius, one of the largest Silurids of the rivers of India and Java, exceeding a length of 6 ft., differs from Arius in having eight barbels and the head covered with skin.

R. Simen has made observations in Queensland on the habits of Arius australis, which builds nests in the sandy bed of the Burnett river. These nests consist of circular basin-like excavations about 20 in. in diameter, at the bottom of which the eggs are laid and covered over by several layers of large stones. In the marine and estuarine species of Arius, Galeichthys and Ostogenosus, the male, more rarely the female, carries the eggs in the mouth and pharynx; these eggs, few in number, are remarkably large, measuring as much as 17 or 18 millimetres in diameter in Arius communis, a fish 3 or 4 ft. in length.

The common North American Amiaurus nebulosus also takes care of its eggs, which are deposited beneath protecting objects at the bottom of the water, failing which both parents join in excavating a sort of nest in the mud. The male watches over the eggs, and later leads the young in great schools near the shore, seemingly caring for them as the hen for her chickens.

In the Siluridae Stenobranchiae of Günther the dorsal fin consists of an adipose portion and a short-rayed fin which belongs to the abdominal vertebral column, and, like the adipose fin, may be sometimes absent. The gill-membranes are confluent with the skin of the isthmus. The Silurids belonging to this section are either South America or Africa. Among the former we notice specially the genus Doras, which is distinguished by having a series of bony scutes along the middle of the side.

ness of their gill-openings appears to have developed in the habit which has excited the attention of all naturalists who have visited the countries bordering upon the Atlantic rivers of tropical America, viz. the habit of travelling during seasons of drought from a piece of water about to dry up to ponds of greater capacity. These journeys are occasionally of such a length that the fish have to travel all night; they are so numerous
CAT-FISH

that the Indians fill many baskets of them. J. Hancock supposes that the fish carry a small supply of water with them in their gill-cavity, which they can easily retain by closing their branchial apertures. The same naturalist adds that they make regular nests, in which they cover up their eggs with care and defend them—male and female uniting in this parental duty until the eggs are hatched. *Synodontis* is an African genus and common in the Nile, where the various species are known by the name of "Shal." They frequently occur among the representations of animals left by the ancient Egyptians. The upper part of their head is protected by strong osseous scutes, and both the dorsal and pectoral fins are armed with powerful spines. Their mouth is small, surrounded by six barbels, which are more or less fringed with a membrane or with branched tentacles.

The curious fact of some species of *Synodontis* having the lower parts darker than the upper, some being whitish above and blackish beneath, appears to be connected with their habit of swimming in a reversed position, the belly turned upwards. This habit, known to the ancient Egyptians, who have frequently represented them in that attitude, has been described by E. Geoffroy, who says they nearly constantly swim on their back, moving quite freely forwards and sideways; but if alarmed, they revert to the normal position to escape more rapidly.

The electric cat- or sheath-fishes (*Malopterus*) have been referred to the same section. Externally they are at once recognized by the absence of a rayed dorsal fin, of which only a rudiment remains as a small internervous spine concealed below the skin. The entire fish is covered with soft, villose skin, an osseous defensive armour having become unnecessary in consequence of the development of a powerful electric apparatus, the strength of which, however, is exceeded by that of the electric eel and the large species of *Torpedo*.

The electric organ of *Malopterus* differs essentially from that of other fishes provided with such batteries, being part of the tegumentary system instead of being derived from the muscles. It consists of rhomboidal cells of a fine gelatinous substance immediately under the skin. It is put into action by a single ganglionic cell at the anterior extremity of the spinal cord. Contrary to what takes place in other electric fishes, the current proceeds from the head to the tail.

The electric cat-fish, which grows to a length of 3 ft. in the Congo, has a wide distribution in Africa, extending from the Nile to the Zambezi and from the Senegal to the Congo. It was well known to the ancient Egyptians, who have depicted it in their mural paintings and elsewhere, and an account of its electric properties was given by an Arab physician of the 12th century; then as now the fish was known under the suggestive name of *Raad or Roast*, which means "thunder."

 Günther’s *Siluridae Branchiopoda* comprise the smallest and least developed members of the family; they are referred to two genera only from South America, *Stegophilus* and *Vandellia*, the smallest of which does not exceed the length of 2 in. Their body is soft, narrow, cylindrical and elongate; the dorsal and anal fins short; the vent far behind the middle of the length of the body; gill-membranes confluent with the skin of the isthmus. Each maxillary is provided with a small barbel; and the gill-covers are armed with short stiff spines. Their small size notwithstanding, these Silurids are well known to the Brazilians, who accuse them of entering and ascending the urethra of persons while bathing, causing inflammation and sometimes death. Some certainly live parasitically in the gill-cavity of large Silurids, and F. Silvestri has observed *Stegophilus insidiosus* to suck the blood in the gills of *Platystoma coruscans*, a Silurid growing to a length of 6 ft.

The mailed cat-fish of the South American genus *Callichthys* builds regular nests of grass on leaves, sometimes placed in a hole scooped out in the bank, in which they cover their eggs and defend them, male and female sharing in this parental duty. In the allied *Corydoras* a lengthy courtship takes place, followed by an embrace, during which the female receives the seminal fluid in a sort of pouch formed by the folded membranes of her ventral fins; immediately after, five or six eggs are produced and received in the pouch, to be afterwards carefully placed in a secluded spot. This operation is repeated many times, until the total number of eggs, about 250, have been deposited. In accordance with these pairing habits, the pectoral spines of the male, which are used in amplexation, are larger and stronger than those of the female. These fish are monogamous, and both parents remain by the side of the nest, furiously attacking any assailant.

The allied family *Loricariidae* is entirely confined to the fresh waters of Central and South America. C. T. Regan, who has recently published an elaborate monograph of them, recognizes 189 species, referred to 17 genera. Many of them are completely mailed; but all have in common a short-rayed dorsal fin, with the
ventrals below or rarely in front of it. Their gill-openings are reduced to a short slit. The first group of this section comprises alpine forms of the Andes, without any armature, and with a very broad and pendent lower lip. They have been referred to several genera (Styracogenys, Arsies, Brontes, Astroblepus), but are collectively called "prenadillas" by the natives, who state that they live in subterranean craters within the bowels of the volcanoes of the Andes, and are ejected with streams of mud and water during eruptions. These fishes may, however, be found in surface waters at all times, and their appearance in great quantities in the low country during volcanic eruptions can be accounted for by numbers being killed by the sulphurised gases which escape during an eruption and by their being swept down with the torrents of water issuing from the volcano. The lowland forms have their body encased in large scutes, either rough, scale-like, and arranged in four or five series (Chaetostomus), or polished, forming broad rings round the slender and depressed tail (Loricaria, fig. 5). They are mostly of small size.

In certain of the mailed genera the secondary sexual differences may be very pronounced, and have given rise to many nominal species. The shape of the snout may differ according to the sex, and its margin may be beset with tentacles in the male, whilst it frequently happens that the head of the latter is margined with spines or bristles which are either absent or considerably shorter in the female.

The Aspredinidae, which are also closely related to the Siluridae, are represented by four genera and eighteen species from South America. Aspredo batrachus (fig. 6), of the Guianas, the largest form, reaching to about a foot in length, deserves notice from the manner in which the female carries her eggs attached to the belly and paired fins, in a single layer, each egg being connected with the skin by a cup-shaped pedunculate base supplied with blood-vessels and coated with a layer of epithelium, the formation of which is still unexplained.

(G. A. B.)

CATGUT, the name applied to cord of great toughness and tenacity prepared from the intestines of sheep, or occasionally from those of the horse, mule and ass. Those of the cat are not employed, and therefore it is supposed that the word is properly kitgut, kit meaning "fiddle," and that the present form has arisen through confusion with kit = cat. The substance is used for the strings of harps and violins, as well as other stringed musical instruments, for hanging the weights of clocks, for bow-strings, and for sutureing wounds in surgery. To prepare it the intestines are cleaned, freed from fat, and steeped for some time in water, after which their external membrane is scraped off with a blunt knife. They are then steeped for some time in an alkaline ley, smoothed and equalized by drawing out, subjected to the antiseptic action of the fumes of burning sulphur, if necessary dyed, sorted into sizes, and twisted together into cords of various numbers of strands according to the size. The best strings for musical instruments are imported from Italy ("Roman strings"); and it is found that lean and ill-fed animals yield the toughest gut.

CATHA, the khat of the Arabs, a shrub widely distributed and much cultivated in Arabia and tropical Africa from Abyssinia to the Cape. The dried leaves are used for the preparation of a kind of tea and also as tobacco. The plant is a member of the natural order Celastraceae, a family of shrubs and trees found in temperate and tropical climates and represented in Britain by the spindle-tree (Euonymus europaeus).

CATHARS (Cathari or Catharians), a widespread heretical sect of the middle ages. They were the debris of an early Christianity, scattered in the 10th to 14th centuries over East and West, having their analogues in the Mahomedan world as well. In the East they were called Bogomils (q.v.) and Paulicians; in the West, Patarines, Tixerands (i.e. Weavers), Bulgars, Concurrices, Albanenses, Algergois, &c.; in both, Cathars and Manicheans. This article relates to the Western Cathars, as they appear (1) in the Cathar Ritual written in Provencal and preserved in a 13th-century MS. found at Lyons, published by Cledar, Paris, 1888; (2) in Bernard Guis's Practica inquisitionis haereticae practiatis, edited by Canon C. Douais, Paris, 1886; and (3) in the procès verbal of the inquisitors' reports. Some were downright dualists, and believed that there are two gods or principles, one of good and the other of evil, both eternal; but as a rule they subordinated the evil to the good. All were universalists in so far as they believed in the ultimate salvation of all men.1

Their tenets were as follows:—The evil god, Satan, who inspired the malevolent parts of the Old Testament, is god and lord of this world, of the things that are seen and are temporal, and especially of the outward man which is decaying, of the earthen vessel, of the body of death, of the flesh which takes us captive under the law of sin and desire. This world is the only true purgatory and hell, being the antithesis of the world eternal, of the inward man renewed day by day, of Christ's peace and kingdom which are not of this world. Men are the result of a primal war in heaven, when hosts of angels incited by Satan or Lucifer to revolt were driven out, and were imprisoned in infernal bodies created for them by the adversary. But there are also celestial bodies, bodies spiritual and not natural. These the angel souls left behind in heaven, and they are buildings from God, houses not made with hands, but of another world, eternal.

1 A certain Peter (Doc. Doct., 22, p. 98) declared that he got hold of the false and pernicious God of the Catholics who created a thousand men in order to save a single one and damn all the rest, he would break him to pieces and tear him asunder with his nails and spit in his face.
CATHARS

Imprisoned in the garment of flesh, burdened with its sin, souls long to be clothed upon with the habitations they left in heaven. So long as they are at home in the body, they are absent from the Lord. They would gain be near to him, and our salvation is only from the body; for which there is no place in heaven since flesh and blood cannot inherit the kingdom of God, nor corruption inherit incorruption. There is no resurrection of the flesh. The true resurrection is the spiritual baptism bequeathed by Christ to the *boni homines*. How shall man escape from his prison-house of flesh, and undo the effects of his fall? For mere death brings no liberation, unless a man is become a new creation, a new Adam, as Christ was; unless he has received the gift of the spirit and become a vehicle of the Paraclete. If a man dies unreconciled to God through Christ, he must pass through another cycle of imprisonment in flesh; perhaps in a human, but with equal likelihood in an animal's body. For when after death the powers of the air throng around and persecute, the soul flees into the first lodging of clay that it finds. Christ was a life-giving spirit, and the *boni homines*, the "good men," as the Cathars called themselves, are his ambassadors. They alone have kept the spiritual baptism with fire which Christ instituted, and which has no connexion with the water baptism of John; for the latter was an unregenerate soul, who failed to recognize the Christ, a Jew whose mode of baptism with water belongs to the fleeting outward world and is opposed to the kingdom of God. It would be interesting to trace Bardesanes and the Syriac Hymn of the Soul in all this.

The Cathars fell into two classes, corresponding to the Baptized and the Catechumens of the early church, namely, the Perfect, who had been "consoled," *i.e.* had received the gift of the Paraclete; and the *credentes* or Believers. The Perfect formed the ordained priesthood, were women no less than men, and controlled the church; they received from the Believers unquestioning obedience, and as vessels of election in whom the Holy Spirit already dwelt, they were adored by the faithful, who were taught to prostrate themselves before them whenever they asked for their prayers. For none but the Consoled had received into their hearts the spirit of God's Son, which cries "Abba, Father." They alone were become adopted sons, and so able to use the Lord's Prayer, which begins, "Our Father, which art in heaven." The Perfect alone knew God and could address him in this prayer, the only one they used in their ceremonies. The mere *credens* could at best invoke the living saint, and ask him to pray for him.

All adherents of the sect seem to have kept three Lents in the year, as also to have fasted Mondays, Wednesdays and Fridays of each week; in these fasts a diet of bread and water was usual. But a *credens* under probation for initiation, which lasted at least one and often several years, fasted always. This life of Perfect was so hard, and, thanks to the inquisitors, so fraught with danger, that most Believers deferred the rite until the death-bed, as in the early centuries many believers deferred baptism. The rule imposed complete chastity. A husband at initiation left his wife, committing her "to God and the gospel"; a wife her husband. A male Perfect could not lay his hand on a woman without incurring penance of a three-days' fast. All begetting of children is evil, for Adam's chambering with Eve was the forbidden fruit. It is good for a man not to touch a woman; a man's relations with his own wife are merely a means of fornication, and marriage and concubinage are indistinguishable as against the kingdom of God, in which there is no marrying or giving in marriage. Those only have been redeemed from earth who were virgins, undefiled with women. The passages of the New Testament which seem to connive at the married relation were interpreted by the Cathars as spoken in regard of Christ and the church. The Perfect must also leave his father and mother, and his children, for a man's foes are they of his own household. The family must be sacrificial to the divine kinship. He that loveth father or mother more than Christ is not worthy of him, nor he that loveth more his son or daughter. The Perfect takes up his cross and follows after Christ.

Next he must abstain from all flesh diet except fish. He may not even eat cheese or eggs or milk, for they, like meat, are produced *per viam generationis seu colus*. Everything that is sexually begotten is impure. Fish were supposed to be born in the water without sexual connexion, and on the basis of this old physiological fallacy the Cathars equally with the Catholic framed their rule of fasting. And there was yet another reason why the Perfect should not eat animals, for a human soul might be doing time in its body. Nor might a Perfect or one in course of probation kill anything, for the Mosaic commandment applies to all life. He might not lie nor take an oath, for the precept "Swear not at all" was, like the rest of the gospel, taken seriously. This was the chief of their "anarchist doctrines." 2

The Cathar rites, which remain to us in a manual of the sect, "recall," says the Abbé Guiraud, no too favourable a witness, "those of the primitive church with a truth and precision the more striking the nearer we go back to the apostolic age." The medieval inquisitor saw in them an aping of the rites of the Catholic church as he knew them; but they were really, says the same authority, "archaeological vestiges (i.e. survivals) of the primitive Christian liturgy. In the bosom of medieval society they were the last witness to a state of things that the regular development of Catholic cult had amplified and modified. They resemble the erratic blocks which lost amid alien souls recall, where we find them, the geological conditions of earlier ages. This being so, it is of the deepest interest to study the Cathar cult, since through its rites we can get a glimpse of those of the primitive church, about which want of documents leaves us too often in the dark." 3

The central Cathar rite was *consolamentum*, or baptism with spirit and fire. The spirit received was the Paraclete derived from God and sent by Christ, who said, "The Father is greater than I." Of a consubstantial Trinity the Cathars naturally had never heard. Infant baptism they rejected because it was unscriptural, and because all baptism with water was an appanage of the Jewish demigure Jehovah, and as such expressly rejected by Christ.

The *consolamentum* removes original sin, undone the sad effects of the primal fall, clothes upon our habituation which is from heaven, restores to us the lost tunic of immortality. A Consoled is an angel walking in the flesh, whom the thin screen of death alone separates from Christ and the beatific vision. The rite was appointed by Christ, and has been handed down from generation to generation by the *boni homines*.

The long probation called "abstinence" which led up to it is a survival of the primitive catechumenate with its scrutinies. The ordination of the *credens* before the Perfect were in their manner and import identical with the prostrations of the catechumen before the exorcist. We find the same custom in the Celtic church of St Columba. Just as at the third scrutiny the early catechumen passed a last examination in the Gospels, Creed and Lord's Prayer, so after their year of abstinence the *credens* receives creed and prayer; the allocation with which the elder "handed on" this prayer is preserved, and of it the Abbé Guiraud remarks that, if it were not in a Cathar ritual, one might believe it to be of Catholic origin. It is so Christian in tone, he quaintly remarks elsewhere, that an inquisitor might have used it quite as well as a heretic. In it the Perfect addresses the postulant, as in the corresponding Armenian rite, by the name of Peter; and explains to him from Scripture the indwelling of the spirit in the Perfect, and his adoption as a son by God. The Lord's Prayer is then repeated by the postulant after the elder, who explains it clause by clause; the words *panis absconditi*.

---

1 Here we have a doctrine of metempsychosis which seems of Indian origin (see ASCETICISM). But Julius Caesar (de B.G. vi. 13) attests this belief among the ancient Druids of Gaul.

2 The Abbé Guiraud remarks that in refusing to take oaths the Cathars "contrasted the social principles on which the constitutions of all states repose," and congratulates himself that society is not yet so thoroughly "laicized" as to have given up oaths in the most important acts of social life.
superstantialis being interpreted not of the material but of the spiritual bread, which consists of the Words of Life.

There followed the Renunciation, primitive enough in form, but the postulant solemnly renounced, not Satan and his works and pomp, but the heresy of the persecutors, whose poison was more deadly than desirable. He renounced the cross which its priests had signed on him with their chism, their sham baptisms and other magical rites. Next followed the spiritual baptism itself, consisting of imposition of hands, and holding of the Gospel on the postulant’s head. The elder begins a fresh allocution by citing Matt. xxviii. 19, Mark xvi. 15, 16, John iii. 3 (where the Cathars’ text must originally have omitted in v. 5 the words “of water and,” since their presence contradicts their argument). Acts ix. 17, 18, viii. 14-17 are then cited; also John xx. 21-23, Matt. xvi. 18, 19, Matt. xvii. 18-20, for the Perfect one receives in this rite power to bind and loose. The Perfect’s vocation is then defined: he must not commit adultery nor homicide, nor lie, nor swear any oath, nor pick and steal, nor do unto another that which he would not have done unto himself. He shall pardon his wrongdoers, love his enemies, pray for them that calumniate and accuse him, offer the other cheek to the smiter, give up his mantle to him that takes his tunic, neither judge nor condemn. Asked if he will fulfill each of these, the postulant answers: “I have this will, but determination. Pray God for me the grace of strength.”

The postulant next reads the following catechism, an extract from the Roman canon as it stood in the 2nd century: “The postulant says: ‘Porciæ nobis. For all the sins we have committed, in word or thought or deed, I come for pardon to God and to the church and to you all.’ And the Christians shall say: ‘By God and by us and by the church may they be pardoned thee, and we pray God that he pardon you them.’”

These follows the act of “consoling.” The elder takes the Gospel off the white cloth, where it has lain all through the ceremony, and places it on the postulant’s head, and the other good men present place their right hands on his head; they shall say the parcia (spare), and thrice the “Let us adore the Father and Son and Holy Spirit,” and then pray thus: “Holy Father, welcome thy servant in thy justice and send upon him thy grace and thy holy Spirit.” Then they repeat the “Let us adore,” the Lord’s Prayer, and read the Gospel (John 1: 1-17).

This was the vital part of the whole rite. The credens is now a Perfect one. He is girt with the sacred thread round his naked body under the breasts. Where the fear of the persecutor was absent he was also clad in a black gown. The Perfect ones present give him the kiss of peace, and the rite is over. This part of the rite answers partly to the Catholic confirmation of a baptized person, partly to the ordination of a pope of Rome or Alexandria. The latter in being ordained had the Gospel laid on their heads, and the same feature occurs in old Gallican and Coptic rites of ordaining a bishop.

Thus the Cathar ritual, like that of the Armenian dissenters (see PAULICIANS), reflects an age when priestly ordination was not yet differentiated from confirmation. “Is it not curious,” says the Abbé Guiraud, “to remark that the essential rite of the consolamentum is in effect nothing but the most ancient form of Christian ordination?”

The Cathar Eucharist was equally primitive, and is thus described by a contemporary writer in a 13th-century MS. of the Milan Library: “The Benediction of bread is thus performed by the Cathars: they take all men and women, go up to a table, and standing up say this: ‘Our Father which art in heaven, let us all when the close of the Lord’s Prayer, shall take hold of the bread and say: ‘Thanks be to the God of our Jesus Christ. May the Spirit be with us all.’ And after that he breaks and distributes to all. And such bread is called bread blessed, although no one believes that out of it is made the body of Christ.”

The Albanenses, however, deny that it can be blessed or sanctified, because it is corporeal (i.e. material).

Tertullian relates of his contemporaries in the 2nd century, so their Cathar brethren, that they ground their rite of breaking bread and keep it for years, eating of it occasionally though only after saying the Benedicite. The Perfect kept it wrapped up in a bag of pure white cloth, tied round the neck, and sent it long distances to regions which through persecution they could not enter. On the death-bed it could even, like the Catholic Vaticanum, take the place of the rite of Consolamentum, if this could not be performed. Once a month this solemn rite of breaking bread was held, the credentes assisting. The service was called appellationum, because a table was covered with a white cloth and the Gospel laid on it. The Perfect were adored, and the kiss of peace was passed round.

The influence of Catharism on the Catholic Church was enormous. To counteract it celibacy was finally imposed on the clergy, and the great mendicant orders were formed; while the constant polemic of the Cathar teachers against the cruelty, rapacity and irascibility of the Jewish tribal god led the Church to inhibit the circulation of the Old Testament among laymen. The sacrament of extreme unction was also evolved by way of combating the Cathars. The first annunciation to the German emperor Frederick I. by the papal legate in 1192, is attributed to these circumstances. The 13th-century story of the Cathar enthusiast on the wall of a circus at Chartres, while said to show the zeal of the Church, is known to be the generation of 16th-century romancers’ tales.

CATHAY—CATHCART, SIR G. (1794–1854), English soldier, third son of the 1st Earl Cathcart, was born in London on the 12th of May 1794. He was educated at Eton and Edinburgh University. In 1810 he entered the army, and two years later accompanied his father to Russia as aide-de-camp. With him he joined the Russian headquarters in March 1813; and he was present at all the great battles of that year in Germany, and of the following year in France, and also at the taking of Paris. The fruits of his careful observation and critical study of these operations appeared in the Commentaries on the war in Russia and Germany 1812–1813, a plain soldier-like history, which he published in 1850. After the peace of 1814 he accompanied his father to the congress of Vienna. He was present at Quatre Bras and at Waterloo, as aide-de-camp to the Duke of Wellington, and remained on the staff till the army of occupation quitted France.

CATHAY, the name by which China (q.v.) was known to medieval Europe and is still occasionally referred to in poetry, as in Tennyson’s “Better fifty years of Europe than a cycle of Cathay.” It is derived from Khitai, or Khitai, the name which was properly that of the kingdom established by the Khitan conquerors in the northern provinces of China about A.D. 907, which after the fall of this dynasty in 1125 remained attached to their former territory, and was subsequently applied by the nations of Central Asia to the whole of China.

The name appeared in Europe first in the 13th century in a description of Cathay—Cathay by John of Plano Carpini, an early 13th-century chronicler, who says: “Now at the end of the world there is a land called Cathay.” It is also the Russian name for China. The name appeared in Europe first in the 13th century, the land of the conquering Khitai, and the name continued in use till the 16th century in search of the north-east passage.

CATHCART, SIR GEORGE (1794–1854), English soldier, third son of the 1st Earl Cathcart, was born in London on the 12th of May 1794. He was educated at Eton and Edinburgh University. In 1810 he entered the army, and two years later accompanied his father to Russia as aide-de-camp. With him he joined the Russian headquarters in March 1813; and he was present at all the great battles of that year in Germany, and of the following year in France, and also at the taking of Paris. The fruits of his careful observation and critical study of these operations appeared in the Commentaries on the war in Russia and Germany 1812–1813, a plain soldier-like history, which he published in 1850. After the peace of 1814 he accompanied his father to the congress of Vienna. He was present at Quatre Bras and at Waterloo, as aide-de-camp to the Duke of Wellington, and remained on the staff till the army of occupation quitted France.
Reappointed almost immediately, he accompanied the duke to the congresses of Aix-la-Chapelle and Verona, and in 1826 to Prussia. Promoted lieutenant-colonel in 1827, he was placed on half-pay in 1834. He was recalled to active service in 1838, and sent as commander of the King's Dragoon Guards to Canada, where he played an important part in suppressing the rebellion and pacifying the country. In 1844 he returned to England, and two years later was appointed deputy-lieutenant of the Tower, a post which he held up to the time of his promotion to major-general in 1851. In March 1852 he succeeded Sir Harry Smith as governor and commander-in-chief at the Cape, and brought the Kaffir war, then in progress, to a successful conclusion. He promulgated the first constitution of Cape Colony, and conducted operations against the Basuto. Cathcart was made a K.C.B. and received the thanks of both Houses for his services (1853). In December 1853 he was made adjutant-general of the army, but never entered upon his duties, being sent out to the Crimean War as soon as he arrived in England. He was even given a dormant commission entitling him to the chief command in case of accident to Lord Raglan, and the highest hopes were fixed on him as a scientific and experienced soldier. But these hopes were not to be fulfilled; for he fell at the battle of Inkerman (November 5, 1854). His remains were brought home and are buried on Cathcart's Hill. Sir George Cathcart married in 1824 Lady Georgiana Greville, who survived him, and by whom he had a family.

See Colburn's United Service Magazine, January 1855: Correspondence of the Hon. Sir George Cathcart relative to Kaffrarian (1856); A. W. Kinglake's Invasion of the Crimea, vol. v.

CATHCART, WILLIAM SCHAW CATHCART, 1st Earl (1755-1843). English soldier and diplomatist, was born at Peter- sham on the 17th of September 1755, and educated at Eton. In 1771 he went to St. Petersburg, where his father, Charles, 9th Baron Cathcart (1721-1776), a general in the army, was ambassador. From 1773 to 1777, he studied law, but after succeeding to the barony in 1776 he obtained a commission in the cavalry. Proceeding to America in 1777, he had before the close of his first campaign twice won promotion on the field of battle. In 1778 he further distinguished himself in outpost work, and at the battle of Monmouth he commanded an irregular corps, the British Legion, with conspicuous success; for a title of which he succeeded as commander-in-chief at the General's request. He returned home in 1780, and in February 1781 was made captain and lieutenant-colonel in the Coldstream Guards. He was elected a representative peer for Scotland in 1788, and in 1792 he became colonel of the 29th foot. He served with distinction in the campaigns in the Low Countries, 1793-1795, in the course of which he was promoted major-general; and in 1801 he was made lieutenant-general, having in the meanwhile received the appointments of vice-admiral of Scotland (1795), privy councillor (1798), and colonel of the 2nd Life Guards (1797). From 1803 to 1805 Lord Cathcart was commander-in-chief in Ireland, and in the latter year he was sent by Pitt in command of the British expedition to Hanover (see Napoleon Campaigns). After the recall of this expedition Cathcart commanded the forces in Scotland until 1807, when he was placed in charge of the expedition to Copenhagen, which surrendered to him on the 6th of September. Four weeks later he created Viscount Cathcart of Cathcart and Baron Greenock of Greenock in the peerage of the United Kingdom, resuming the "Scottish command" on his return from the front. On the 1st of January 1812 he was promoted to the full rank of general, and a few months later he proceeded to Russia as ambassador and military commissioner. In the latter capacity he served with the headquarters of the allies throughout the War of Liberation (1812-1814); his success in the delicate and difficult task of maintaining harmony and devotion to the common cause amongst the generals of many nationalities was recognized after the war by his elevation to the earldom (July 1814). He then went to St. Petersburg, and continued to hold the post of ambassador until 1820, when he returned to England. He died at his estate near Glasgow on the 16th of June 1843.

His son, CHARLES MURRAY CATHCART, 2nd Earl (1783-1859), succeeded to the title in 1843. He entered the 2nd Life Guards in 1800, and saw active service under Sir James Craig in the Mediterranean, 1805-1806. In 1807 he became by courtesy Lord Greenock. He took part in the Walcheren expedition of 1809 as a major, and as a lieutenant-colonel served at Barossa, Salamanka and Vittoria. He had already gained staff experience, and he now served under Graham in Holland, 1814, as quarter-master-general. He was present at Waterloo, and for his services received the C.B. and several foreign orders. During the peace he became deeply interested in scientific pursuits, and a new mineral discovered by him in 1843 was named Greenockite. His later military services included the chief command in Canada during a period of grave unrest (1846-1849). He retired from active service in 1859, becoming a full general just before his death. The title passed to his son and grandson as 3rd and 4th earls of Cathcart.

CATHCART, a parish situated partly in Renfrewshire and partly in Lanarkshire, Scotland. The Renfrewshire portion has the larger area (2387 acres), but the smaller population (3735), the area of the Lanarkshire portion being 745 acres and the population (1901) 20,983. The industries include paper-making, and the manufacture of worsted and cotton. A limestone quarry has been worked. The parish includes the town of Cathcart (pop. 4868), and the villages of Old and New Cathcart, but much of it, though outside the city boundaries, is practically continuous with some of the southern suburbs of Glasgow, with which there is communication by electric tram and the Caledonian railway's circular line. The White Cart flows through the parish. In the 12th century Cathcart became a barony of the Cathcarts, who derived the title of their lordship (1460) and earldom (1814) from it. On the Queen's Knowe, a hillock near the ruins of Cathcart Castle, a memorial marks the spot where Queen Mary watched the progress of the battle of Langside (1568), the site of which lies within the parish.

CATHEDRAL, more correctly "cathedral church" (ecclesia cathedralis), the church which contains the official "seat" or throne of a bishop—cathedra, one of the Latin names for this, giving us the adjective "cathedral." The adjective has gradually, for briefness of speech, assumed the character of a substantive, but though an instance of this (strictly incorrect) use of the word in English, a "cathedral city" is not a "city," as far back as 1381 it became common only at the end of the 18th, or first half of the 19th century. One of the earliest instances of the term ecclesia cathedralis is said to occur in the acts of the council of Tarragona in 516. Another name for a cathedral church is ecclesia mater, indicating that it is the mother church. As being the one important church, it was also known as ecclesia major. This is the formal expression used by Archbishop Walter Gray of York (1216-1255), and it is preserved in modern times by the name of "La Majeure," by which the old cathedral church of Marseilles is popularly known. Again, as the chief house of God, the cathedral church was the Domus Dei, and from this name the German Domkirche, or Dom, is derived, as also the Swedish Domkyrka, and the Italian Duomo.

History and Organization.—It was early decreed that the cathedral of a bishop was not to be placed in the church of a village, but only in that of a city. There was no difficulty as to this on the continent of Europe, where towns were numerous, and where the cities were the natural centres from which Christianity was diffused. Sometimes the people were brought to the surrounding districts. In the British islands, however, the case was different; towns were few, and owing to other causes, instead of exercising jurisdiction over definite areas or districts, many of the bishops were bishops of tribes or peoples, as the bishops of the south Saxons, the west Saxons, the Somerseats and others. The cathedra of such a bishop was often migratory, and was at times placed in one church, and then another, and sometimes in the church of a village. In 1075 a council was held in London, under the presidency of Archbishop Lanfranc, which, rectifying the decrees of the council of Sardica held in 347 and that of Laodicea held in 360 on this matter, ordered the
bishops of the south Saxons to remove his see from Selcet to Chichester; the Wilt and Dorset bishop to remove his cathedral from Sherborne to Old Sarum, and the Mercian bishop, whose cathedral was then at Lichfield, to transfer it to Chester. Traces of the tribal and migratory system may still be noted in the designations of the Irish see of Meath (where the result has been that there is now no cathedral church) and Osory, the cathedral church of which is at Kilkenny. Some of the Scottish sees were also migratory.

By the canon law the bishop is regarded as the pastor of the cathedral church, the parochia of which is his diocese. In view of this, canonists speak of the cathedral church as the one church of the diocese, and all others are deemed chapels in its relation to it.

Occasionally two churches jointly share the distinction of containing the bishop's cathedral. In such case they are said to be co-cathedral in relation to each other. Instances of this occurred in England before the Reformation in the dioceses of Bath and Wells, and of Coventry and Lichfield. Hence the double titles of those dioceses.

In Ireland an example occurs at Dublin, where Christ Church and St Patrick's are jointly the cathedral churches of that diocese. In France the bishop of Coutances (a see suppressed at the Revolution) had two co-cathedral churches at St Lizier, and the bishop of Sideron (a see also suppressed) had a second throne in the church of Forcalquier which is still called "La Con-cathédrale." Other instances might be named. In the case of York the collegiate churches of Beverley, Ripon and Southwell were almost in the same position, but although the archbishop had a stall in each he had no diocesan cathedral in them, and the chapters were not united with that of the metropolitical church in the direct government of the diocese, or the election of the archbishop, nor had they those other rights which were held to denote the cathedral character of a church.

Cathedral churches are reckoned as of different degrees of dignity: (1) the simple cathedral church of a diocesan bishop, (2) the metropolitical church to which the other diocesan cathedral churches of a province are suffragan, (3) the primatial church under which are ranged metropolitical churches and their provinces, (4) patriarchal churches to which primatial, metropolitical, and simple cathedral churches alike owe allegiance. The title of "primate" was occasionally conferred on metropolitans of sees of great dignity or importance, such as Canterbury, York, Rouen, &c., whose cathedral churches remained simply metropolitical. Lyons, where the cathedral church is still known as "La Primatiale," and Lund in Sweden, may be cited as instances of churches which were really primatial. Lyons had the archbishops of Sens and Paris and their provincial dioces is subject to it till the Revolution, and Lund had the archbishop of Upsala and his province subject to it. As with the title of primate, so also that of "priarch" has been conferred on sees such as Venice and Lisbon, the cathedral churches of which are patriarchal in name alone. The cathedral church of St John Lateran, the cathedral church of the pope as bishop of Rome and patriarch of the West, alone in western Europe possesses potentially a patriarchal character. Its formal designation is "Patriarchalis Basilica, Sacrosanctum Romana Cathedra" in Eclesia Lateranensis."

The removal of a bishop's cathedral from a church deprives that church of its cathedral dignity, although often the name clings in common speech, as for example at Antwerp, which was deprived of its bishop at the French Revolution. The history of the body of clergy attached to the cathedral church is complex, and in such case local considerations affected its development, all that can be attempted is to give a general outline of the main features which were more or less common to all. Originally the bishop and cathedral clergy formed a kind of religious community, which, in no true sense a monastery, was nevertheless often called a monasterium. The word had not the restricted meaning which it afterwards acquired. Hence the apparent anomaly that churches like York and Lincoln, which never had any monks attached to them, have inherited the name of minster or monastery. In these early communities the clergy often lived apart in their own dwellings, and were not infrequently married.

In the 6th century, however, Chrodegang, bishop of Metz (743-769), compiled a code of rules for the clergy of the cathedral churches, which, though widely accepted in Germany and other parts of the continent, gained little acceptance in England. According to Chrodegang's rule the cathedral clergy were to live under a common roof, occupy a common dormitory and submit to the authority of a special officer. The rule of Chrodegang was, in fact, a modification of the Benedictine rule. Gis, a native of Lorraine, who was bishop of Wells from 1061 to 1088, introduced it into England, and imposed its observance on the clergy of his cathedral church, but it was not followed for long there, or elsewhere in England.

During the two centuries, roughly bounded by the years 900 and 1100, the cathedral clergy became more definitely organized, and were also divided into two classes. One was that of a monastic establishment of some recognized order of monks, very often that of the Benedictines, while the other class was that of a college of clergy, living in the world, and bound by no vows, except those of their ordination, but governed by a code of statutes or canons. Hence the name of "canon" given to them.

In this way arose the distinction between the monastic and secular cathedral churches. In England the monastic cathedral churches were Bath, Canterbury, Carlisle, Coventry, Durham, Ely, Norwich, Rochester, Winchester and Worcester, all of them Benedictine except Carlisle, which was a church of Augustinians. The secular churches were Chichester, Exeter, Hereford, Lichfield, Lincoln, St Paul's (London), Salisbury, Wells, York, and the four Welsh cathedral churches. In Ireland all were secular except Christ Church, Dublin (Augustinian), and Down (Benedictine), and none, even in their earliest days, were ever, it is believed, churches of recognized orders of monks, except the two named. In Scotland St Andrew's was Augustinian, Elgin (or Moray), Glasgow and Aberdeen were always secular, and ordered on the models of Lincoln and Salisbury.

Brefhin had a community of Culdees till 1372, when a secular chapter was constituted. The cathedral church of Galloway, at Whithorn, of English foundation, was a church of Praemonstratensians. In Germany, as in England, many of the cathedral churches were monastic. In Denmark all seem to have been Benedictine at first, except Börgum, which was Praemonstratensian till the Reformation. The others were changed to churches of secular canons. In Sweden, Upsala was originally Benedictine, but was secularized about 1250, and it was ordered that each of the cathedral churches of Sweden should have a chapter of at least fifteen secular canons. In France monastic chapters were very common; but nearly all the monastic cathedral churches there had been changed to churches of secular canons before the 11th century. One of the latest to be so changed was that of Seez, in Normandy, which was Augustinian till 1547, when Pope Paul III. dispersed the members from their vows, and constituted them a chapter of secular canons. The chapter of Seez was monastic till 1647, and others perhaps even later, but the majority were secularized about the time of the Reformation.
to the neglect of his domestic and ecclesiastical duties, and complaints were soon raised that the provost was too much mixed in worldly affairs, and was too frequently absent from his spiritual responsibilities. This led to the practice of creating a new officer called the "dean," who had charge of that portion of the provost's duties which related to the internal discipline of the chapter and the services of the church. In some cases the office of provost was abolished, but in others it was continued, the provost, who was also occasionally archdeacon as well, remaining head of the chapter. This arrangement was most commonly followed in Germany. In England the provost was almost unknown. Bishop Gisli introduced a provost as head of the chapter of Wells, but the office was afterwards subordinated to the other dignitaries, and the provost became simply the steward of certain of the prebendal lands. The provost of the collegiate church of Beverley was the most notable instance of such an officer in England, but at Beverley he was an external officer with no authority in the government of the chapter, no stall in the choir and no vote in chapter. The provost of Eton, introduced by Henry VI., occupied a position most nearly approaching that of a foreign cathedral provost. In Germany and in Scandinavia, and in a few of the cathedral churches in the south of France, the provost was the ordinary head of the cathedral chapter, but the office was not common elsewhere. As regards France, of one hundred and thirty-six cathedral churches existing at the Revolution, thirty-eight only, and those either on the borders of Germany, or in the extreme south, had a provost as the head of the chapter. In others the provost existed as a subordinate officer. There were two provosts at Autun, and Lyons and Chartres had each, all as subordinate officers.

The normal constitution of the chapter of a secular cathedral church comprised four dignitaries (there might be more), in addition to the canons. The dean (decanus) seems to have derived his designation from the Benedictine dean who had ten monks under his charge. The dean, as already noted, came into existence to supply the place of the provost in the internal management of the church and chapter. In England the dean was the head of all the secular cathedral churches, and was originally elected by the chapter and confirmed in office by the bishop. He is president of the chapter, and in church has charge of the due performance of the services, taking specified portions of them by statute on the principal festivals. He sits in the chief stall in the choir, which is usually the first on the right hand on entering the choir at the west. Next to the dean (as a rule) is the precentor (primicerius, cantor, &c.), whose special duty is that of regulating the musical portion of the services. He presides in the dean's absence, and occupies the corresponding stall on the left side, although there are exceptions to this rule, where, as at St Paul's, the archdeacon of the cathedral city ranks second and occupies what is usually the precentor's stall. The third dignitary is the chancellor (scholasticius, ecldtre, capixol, magistral, &c.), who must not be confounded with the chancellor of the diocese. The chancellor of the cathedral church is charged with the oversight of its schools, ought to read divinity lectures, and superintend the lections in the choir and correct slovenly readers. He is often the secretary and librarian of the chapter. In the absence of the dean and precentor he is president of the chapter. The easternmost stall, on the dean's side of the choir, is usually assigned to him. The fourth dignitary is the treasurer (custos, sacrista, chefler). He is guardian of the fabric, and of all the furniture and ornaments of the church, and his duty was to provide bread and wine for the eucharist, and candles and incense, and he regulated such matters as the ringing of the bells. The treasurer's stall is opposite to that of the chancellor. These four dignitaries, occupying the four corner stalls in the choir, are called in many of the statutes the "quatuor personae" of the church. In many cathedral churches there were additional dignitaries, as the praegerector, subdean, vice-chancellor, succesor-canonicorum, and others, who, came into existence to supply the places of the other absent dignitaries, for non-residence was the fatal blow of the secular churches, and in this they contrasted very badly with the monastic churches, where all the members were in continuous residence. Besides the dignitaries there were the ordinary canons, each of whom, as a rule, held a separate prebend or endowment, besides receiving his share of the common funds of the church. For the most part the canons also speedily became non-resident, and this led to the distinction of residential and non-residential canons, till in most churches the number of resident canons became definitely limited in number, and the non-residential canons, who no longer shared in the common funds, became generally known as prebendaries only, although by their non-residence they did not forfeit their position as canons, and retained their votes in chapter like the others. This system of non-residence led also to the institution of vicars choral, each canon having his own vicar, who sat in his stall in his absence, and when the canon was present, in the stall immediately below, on the second form. The vicars had no place or vote in chapter, and, though irremovable except for offences, were the servants of their absent canons whose stalls they occupied, and whose duties they performed. Abroad they were often called demi-prebendaries, and they formed the bas chaur of the French churches. As time went on the vicars were themselves often incorporated as a kind of lesser chapter, or college, under the supervision of the dean and chapter.

There was no distinction between the monastic cathedral chapters and those of the secular canons, in their relation to the bishop or diocese. In both cases the chapter was the bishop's "congregation," which he was bound to consult on all important matters and without doing so he could not act. Thus a jurisdiction of a bishop needed the confirmation of the chapter before it could be enforced. He could not change the service books, or "use" of the church or diocese, without capitular consent, and there are many episcopal acts, such as the appointment of a diocesan chancellor, or vicar general, which still need confirmation by the chapter, but the older theory of the chapter as the bishop's council in ruling the diocese has become a thing of the past, not in England only, but on the continent also. In its corporate capacity the chapter takes charge sede vacante of a diocese. In England, however (except as regards Salisbury and Durham), this custom has never obtained, the two archbishops having, from time immemorial, taken charge of the vacant dioceses in their respective provinces. When, however, either of the sees of Canterbury or York is vacant; the chapters of those churches take charge, not only of the diocese, but of the province as well, and incidentally, therefore, of any of the dioceses of the province which may be vacant at the same time.

All the English monastic cathedral chapters were dissolved by Henry VIII., and, except Bath and Coventry, were refounded by him as churches of secular chapters, with a dean as the head, and a certain number of canons ranging from twelve at Canterbury and Durham to four at Carlisle, and with certain subordinate officers as minor canons, gospellers, epistolaris, &c. The precentorship in these churches of the "New Foundation," as they are called, is not, as in the secular churches of the "Old Foundation," a dignity, but is merely an office held by one of the minor canons.

English cathedral churches, at the present day, may be classed under four heads: (1) the old secular cathedral churches of the "Old Foundation," enumerated in the earlier part of this article; (2) the churches of the "New Foundation" of Henry VIII., which are the monastic churches already specified, with the exception of Bath and Coventry; (3) the cathedral churches of bishoprics founded by Henry VIII., viz. Bristol, Chester, Gloucester, Oxford and Peterborough (the constitution of the chapters of which corresponds to those of the New Foundation); (4) modern cathedral churches of sees founded since 1836, viz. (a) Manchester, Ripon and Southwell, formerly collegiate churches of secular canons; (b) St Albans and Southwark, originally monastic churches; (c) Truro, Newcastle and Wakefield, formerly parish churches, (d) Birmingham and Liverpool, originally district churches. The ruined cathedral church of the diocese of Sodor (i.e. the Southern Isles) and Man, at Peel in the latter island, appears never to have had a chapter of clergy attached to it.
Architecture.—From the architectural point of view there is no special treatment that regards dimension or style for a cathedral other than that required for a church or abbey, as there are cases when the former are comparatively small buildings (like the old cathedral at Athens), and some parish churches and abbeys are larger than many cathedrals. In recent times, indeed, some English abbeys or minsters, such as those of Ripon, Manchester, St Albans and Southwell, partly on account of their dimensions, have been raised to the rank of cathedrals, in consequence of the demand for additional seats; others, such as those of Bristol, Gloucester, Oxford, Chester and Peterborough, became cathedrals only on the dissolution of the monasteries by Henry VIII.

Under the headings NAVE, AISLE, CHOIR, APSE, CHEVET, and LADY-CHAPEL, the principal arrangements of the plan of a cathedral are dealt with, and its architectural features, such as TOWER AND SPIRE, PORCH, TRIFORIUM, CLERESTORY and VAULT, are separately defined; while in the article ARCHITECTURE the evolution of the various styles in England, France, Germany, Italy and Spain, is set forth. It is only necessary here to deal with the development of the eastern end of English and foreign cathedrals, as it was in those that the greatest changes from the middle of the 11th century to the close of the 16th century took place.

The earliest extended development of the eastern end of the cathedral is that which was first set out in Edward the Confessor's church at Westminster, probably borrowed from the ancient church of St Martin at Tours; in this church, dating probably from the 10th century, two new elements are found, (1) the carrying of the choir aisle round a circular apse so as to provide a processional aisle round the eastern end of the church, and (2) five apsidal chapels, constituting the germ of the chevet, which transformed the eastern terminations of the French cathedrals in the 12th and 13th centuries. It is only within recent times that the foundations of the early church at Tours with its choir aisle and chapels have been traced under the existing church.

In Edward the Confessor's church (1060) there were probably only three chapels and a processional aisle; in the next example at Gloucester (1089) were also three chapels, two of which, on the north and south sides of the aisle, still remain; the same is found in Canterbury (1066–1107) and Norwich (1089–1119), the eastern chapel in all three cases having been taken down to make way for the Lady-chapel in Gloucester and Norwich, and for the Trinity chapel in Canterbury cathedral (fig. 1). The semicircular aisle is said to have existed in the Anglo-Norman cathedral of Winchester, but the eastern end being square, two chapels were arranged filling the north and south ends, and an apsidal chapel projecting beyond the east wall. This semicircular processional aisle with chevet chapels was the favourite type of plan in the Anglo-Norman cathedrals, and was followed up to about the middle of the 12th century, when the English builders in some cases returned to the square east end instead of the semicircular apsidal termination. The earliest example of this exists in Romsey Abbey (c. 1130), where the processional path crosses behind the presbytery, there being eastern apsidal chapels in the axis of the presbytery aisle and a central rectangular chapel beyond. A similar arrangement is found in Hereford cathedral, and exists in Winchester, Salisbury (fig. 2), Durham, St Albans, Exeter, Ely, Wells and Peterborough, except that in all those cases (except Wells) the eastern chapels are square ended; in Wells cathedral the most eastern chapel (the Lady-chapel) has a polygonal termination; in Durham (fig. 3), the eastern chapels are all in one line, constituting the chapel of the nine altars, which was probably borrowed from the eastern end of Fountains Abbey. It should be noted that in some of the above the original design has been transformed in rebuilding; thus in St Albans, Durham, York and Exeter cathedrals, there was no eastern ambulatory but three parallel apses, in some cases rectangular externally. In Southwell, Rochester, Ely and Chester, there was no processional path or ambulatory round the east end; in Carlisle no eastern chapels; and in Oxford only one central apse. In Ely cathedral (fig. 4) the great central tower built by the first Norman abbot (1082–1094) fell down in 1321, carrying with it portions of the adjoining bays of the nave, transept and choir; instead of attempting to rebuild the tower.
Alan of Walsingham conceived the idea of obtaining a much larger area in the centre of the cathedral, and instead of rebuilding the piers of the tower he took as the base of his design a central octagonal space, the width of which was equal to that of nave and aisles, with wide arches to nave, transepts and choir, and smaller arches across the octagonal sides; from shafts in the eight pier angles, ribs in wood project forward and carry a smaller octagon on which the lantern rests. Internally the effect of this central octagon is of great beauty and originality, and it is the only instance of such a feature in English Gothic architecture. (See Architecture, Plate VIII., fig. 82.)

The earliest example of the chevet is probably to be found in the church of St Martin at Tours; this was followed by others at Tournus, Clermont-Ferrand, Auxerre, Chartres, Le Mans and other churches built during the great church-building period of the 11th century. In the still greater movement in the 12th century, when the episcopacy, supported by the emancipated communes, undertook the erection of cathedrals of greater dimensions and the reconstruction of others, in some cases they utilized the old foundations, as in Chartres (fig. 5), Coutances and Auxerre cathedrals, while in others (as at Le Mans) they extended the eastern termination, much in the same way as in many of the early examples in England, with this important difference, that when the apsidal east end was given up (about the middle of the 12th century) in favour of the square east end in England, the French, on the other hand, developed it by doubling the choir aisles and adding to the number of extra chapels; thus in Canterbury, Norwich and Gloucester, there were only three apsidal chapels in the chevet, whereas in Noyon (1130), Soissons (1190), Reims (1212), Tours, Seez, Bayeux (1230), Clermont (1275), Senlis, Limoges, Albi and Narbonne cathedrals there were five; in Amiens, Le Mans and Beauvais, there were seven apsidal chapels, and in Chartres cathedral nine. Double aisles round the choir, of which there are no examples in England, are found in the cathedrals of Paris, Bourges and Le Mans; the cathedral of Sens (fig. 6) (1144-1168) possesses one feature which is almost unique, viz. the coupled columns of the alternate bays of nave and choir and of the apse; and these were introduced into the chapel of the Trinity in Canterbury cathedral, probably from the designs of William of Sens, by his successor William the Englishman. The square east end found no favour in France—Laon, Poitiers and Dol being the only cathedral examples; and of the triapsidal arrangement, viz. with apses in the axes of the choir aisle and a central apse, the only example is that of the cathedral of Autun. The immense development given to the eastern limb of the French cathedrals was sometimes obtained at the expense of the nave, so that, notwithstanding the much greater dimensions compared with English examples, in the latter the naves are much longer and consist of more bays than those in France.

In one of the French cathedrals, Bourges, there is no transept; on the other hand there are many examples in which this part of the church is emphasized by having aisles on each side, as at Laon, Soissons, Chartres, Reims, Amiens, Rouen and Clermont cathedrals. Transept aisles in England are found in Ely, York, Wells and Winchester cathedrals, in the last being carried round the south and north ends of the transept; aisles on the east side of the transept only, in some cases probably for
additional altars, exist in Durham, Salisbury, Lichfield, Peterborough and Ripon cathedrals; and on the north side only in Hereford cathedral. In Rouen cathedral, east of the transept aisles, there are apsidal chapels, which with the three chapels in the chevet make up the usual number. The cathedral of Poitiers has been referred to as an example of a square east end, but a sort of compromise has been made by the provision of three segmental apses, and there are no windows in the east front; the most remarkable divergence from the usual design is found here in the absence of any triforium or clerestory, owing to the fact that the vault of the aisles is nearly as high as that of the nave, so that it constitutes an example of what in Germany (where there are many) are called Hallen Kirchen; the light being obtained through the aisle windows only gives a gloomy effect to the nave. Another departure from the usual plan is that found in Albi cathedral (1350), in which there are no aisles, their place being taken by chapels between the buttresses which were required to resist the thrust of the nave vault, the widest in France. The cathedral is built in brick and externally has the appearance of a fortress. In the cathedrals of the south-west of France, where the naves are covered with a series of domes—as at Cahors, Angoulême and St Front de Périgueux—

the immense piers required to carry them made it necessary to dispense with aisles. The cathedral of Angoulême (fig. 7) consists of a nave covered with three domes, a transept of great length with lofty towers over the north and south ends, and an apsidal choir with four chevet chapels. In St Front de Périgueux (1150), based on St Mark's at Venice, the plan consists of nave, transept and choir, all of equal dimensions, each of them, as well as the crossing, vaulted over with a dome, while originally there was a single apsidal choir.

Returning now to the great cathedrals in the north of France, we give an illustration (fig. 8) of Amiens cathedral (from Viollet le Duc's Dictionnaire raisonné) which shows the disposition of a cathedral, with its nave-arches, triforium, clerestory windows and vault, the flying buttresses which were required to carry the thrust of the vault to the outer buttresses which flanked the aisle walls, and the lofty pinnacles which surmounted them. In this case there was no triforium gallery, owing to the greater height given to the aisles. In Notre Dame at Paris the triforium was nearly as high as the aisles; in large towns this feature gave increased accommodation for the congregation, especially on the occasion of great fêtes, and it is found in Noyon, Laon, Senlis and Soissons cathedrals, built in the latter part of the 12th century; later it was omitted, and a narrow passage in the thickness of the wall only represented the triforium; at a still later period the aisles were covered with a stone pavement of slight fall so as to allow of loftier clerestory windows.

The cathedrals in Spain follow on the same lines as those in France. The cathedral of Santiago de Compostela is virtually a copy of St Sernin at Toulouse, consisting of nave and aisles, transepts and aisles, and a choir with chevet of five chapels; at Leon there is a chevet with five apsidal chapels, and at Toledo an east end with double aisles round the apse with originally seven small apsidal chapels, two of them rebuilt at a very late period. At Leon, Barcelona and Toledo the processional passage round the apse with apsidal chapels recalls the French disposition, there being a double aisle around the latter, but in Leon and Toledo cathedrals the east end is masked externally by other buildings, so that the beauty of the chevet is entirely lost. At Avila and Salamanca (old cathedral) the triapsal arrangement is adopted, and the same is found in the German cathedrals, with one important exception, the cathedral of Cologne, which was based on that of Amiens, the comparative height of the former, however, being so exaggerated that scale has been lost, and externally it has the appearance of an overgrown monster.

Under the headings VAULT, FLYING BUTTRESS, PINNACLE, CLEARESTORY AND TRIFORIUM, definitions are given of these chief components of a cathedral or church; but as their design varies materially in almost every example, without a very large number of drawings it would be impossible to treat them more in detail. The perspective view, taken from Viollet le Duc's dictionary, of the interior of the nave of Amiens cathedral illustrates the principal features, viz. the vault (in this case quadripartite, with flying buttresses and pinnacles), the triforium (in this case limited to a narrow passage in the thickness of the wall), and the nave-arches, with the side aisles, beneath the windows of which is the decorative arcade.

CATHELINEAU, JACQUES (1750-1793), French Vendean chieftain during the Revolution, was born at Tin-en-Manges, in the country now forming the department of Maine-et-Loire. He became well known in the country of Anjou, over which he travelled as a pedlar and dealer in contraband goods. His physical strength and his great piety gave him considerable ascendancy over the peasants, who surnamed him "the saint of Anjou." In the first years of the Revolution, Cathelineau devoted to the exhortations of Catholic priests and royalist émigrés, and joined the insurrection provoked by them against the revolutionary government. Collecting a band of peasants and smugglers, he took the château of Gallais, where he captured a cannon, christened by the Vendean "the Missionary"; he then took the towns of Chemillé, Cholet, Vihiers and Chalonnes (March 1793). His companions committed atrocities which brought upon them terrible reprisals on the part of the
CATHERINE, SAINT

Rebels. Meanwhile Cathelineau’s troops increased, and he combined with the other Vendean chiefs, such as N. Stofflet and Giger d’Elbée, seizing the towns of Beaupré, Fontenay and St-Omer. The first successes of the Vendées were due to the fact that the Republicans had not expected an insurrection. When the resistance to the insurgents became more serious, differences arose among their leaders. To avoid these rivalries, it is thought that Cathelineau was named generalissimo of the rebels, though his authority over the undisciplined troops was not increased by the new office. In 1793 all the Royalist forces tried to capture Nantes. Cathelineau entered the town in spite of the resistance of General J. B. C. Canclaux, but he was killed, and the Vendean army broke up. Numerous relatives of Cathelineau also perished in the war of La Vendée. His grandson, Henri de Cathelineau, figured in the war of 1870 between France and Germany (see also Vendée; Chouans).

CATHERINE, SAINT. The Roman hagiography contains the record of six saints of this name. 1. St Catherine of Alexandria, Virgin and Martyr, whose day of commemoration recurs on the 25th of November, and in some places on the 5th of March. Her feast is celebrated by Swen, a daughter of Bror, who died abbess of Watzen in March 381, and is commemorated on the 22nd of that month. 3. St Catherine of Siena, 1347-1380, whose festal day is observed on the 30th of April. 4. St Catherine of Bologna, 1413-1463, a visionary, abbess of the convent of the Poor Clares in Bologna, canonized by Pope Benedict XIII., and commemorated throughout the Franciscan order on the 6th of March. 5. St Catherine of Genoa, who belonged to the noble family of Fieschi, was born about 1447, spent her life and her means in succouring and attending on the sick, especially in the time of the plague which ravaged Genoa in 1497 and 1501, died in that city in 1510, was beatified by Clement V. in 1675 and canonized by Clement XII. in 1737; her name was placed in the calendar on the 22nd of July by Benedict XIV. 6. St Catherine de’ Ricci, of Florence, daughter of a wealthy merchant prince, was born in 1522, became a nun in the convent of the Dominicans at Prato in 1536, and died in 1589. She was famous during her life-time for the weekly ecstasy of the Passion, during which in a trance she experienced the sufferings of the Holy Virgin contemplating the Passion of her Son. She was canonized in 1746 by Benedict XIV., who fixed her festal day on the 13th of February. In Celtic and English martyrologies (November 25) there is also commemorated St Catherine Audley (c. 1330-1383), a nun and recluse of Ledbury, Hereford, who was reputed for piety and clairvoyance.

Of two of these saints, St Catherine of Alexandria, the St Catherine par excellence, and St Catherine of Siena, something more must be said. Of the former history has little or nothing to tell. The Maronite scholar, Joseph Simon Assemanni (1687-1768), first identified her with the royal and wealthy lady of Alexandria (Eusebius, Hist. Eccl. viii. 14) who, for refusing the solicitations of the emperor Maximinus, was deprived of her property and banished. But Ruinus (Hist. Eccl. viii. 17) called this lady Dorothea, and the old Catherine legend, as recorded in the Roman martyrology and by Simeon Metaphrastes, has quite other features. According to it Catherine was the daughter of King Konetos, eighteen years old, beautiful and wise. During the persecution under Maximinus she sought an interview with the emperor, upbraided him for his cruelties, and adjured him to give up the worship of false gods. The angry tyrant, unable to refute her arguments himself, sent for pagan scholars to argue with her, but they were discomfited. Catherine was then scourged and cast into prison, and the emperor was sent to reason with her; but the dauntless virgin converted not only the emperor but the Roman general and his soldiers who had accompanied her. Maximinus now ordered her to be broken on the wheel; but the wheel was broken by her touch. The headsmen’s axe proved more fatal, and the martyr’s body was taken by an angel to Mount Sinai, where Justinian I. built the famous monastery in her honour. Another development of the legend is that in which, having rejected many offers of marriage, she was taken to heaven in vision and betrothed to Christ by the Virgin Mary.

Of all these marvellous incidents very little, by the universal admission of Catholic scholars, has survived the test of modern criticism. That St Catherine actually existed there is, indeed, no evidence to prove; and it is possible that some of the elements in her legend are due to confusion with the story of Hypatia (q.v.), the neo-platonic philosopher of Alexandria, who was done to death by a Christian mob. To the men of the middle ages, in any case, St Catherine was very real; she was ranked with the fourteen most helpful saints in heaven, and was the constant theme of preachers and of poets. Her festival was celebrated in many places with the utmost splendour, and in certain dioceses in France was a holy day of obligation as late as the beginning of the 17th century. Numberless chapels were dedicated to her, and in nearly all churches her statue was set up, the saint being represented with a wheel, her instrument of torture, and sometimes with a crown and a book. The wheel being her symbol she was the patron saint of wheelwrights and mechanics; as the confessor of a young nobleman was imprisoned by theologians, apologists, preachers and philosophers and was then chosen as the patron saint of the university of Paris; as the most holy and illustrious of Christian virgins she became the tutelary saint of nuns and virgins generally. So late as the 16th century, Bossuet delivered a panegyric upon her, and it was the action of Dom Defor, the Benedictine editor of his works, in criticizing the accuracy of the data on which this was based, that first discredited the legend. The saint’s feast was removed from the Breviary at Paris about this time, and the devotion to St Catherine has since lost its earlier popularity. See Leon Clugnet’s article in the Catholic Encyclopaedia, vol. iii. (London, 1908).

St Catherine of Siena was the youngest of the twenty-five children of Giacomo di Benincasa, a dyer, and was born, with a twin-sister who did not survive her birth, on the 25th of March 1347. A highly sensitive and imaginative child, she very early began to practise asceticism and see visions, and at the age of seven solemnly dedicated her virginity to Christ. She was attracted by what she had heard of the desert anchorites, and in 1363-1364, after much struggle, persuaded her parents to allow her to take the habit of the Dominican tertiaries. For a while she led at home the life of a recluse, speaking only to her confessor, and spending all her time in devotion and spiritual ecstasy. Her innate humanity and sound sense, however, led her gradually to return to her place in the family circle, and she began also to seek out and help the poor and the sick. In 1368 her father died, and she assumed the care of her mother Lapa. During the following years she became known to an increasingly wide circle, especially as a peacemaker, and entered into correspondence with many friends. Her peculiarities excited suspicion, and charges seem to have been brought against her by some of the Dominicans to answer which she went to Florence in 1374, soon returning to Siena to tend the plague-stricken. Here first she met the Dominican friar, Raimondo of Capua, her confessor and biographer.

The year 1375 found Catherine entering on a wider stage. At the invitation of Piero Gambaconti, the ruler of the republic of Pisa, she visited that city and there endeavoured to arouse enthusiasm for the proposed crusade, urging princes and presidents, commanders and private citizens alike to join in “the holy passage.” To this task was added that of trying to keep Pisa and Lucca from joining the Tuscan League against the pope. It was at Pisa, in the church of Santa Cristina, on the fourth Sunday in Lent (April 1), while rapt in ecstasy after the communion, that Catherine’s greatest traditional glory befell her, viz. the stigmata or impression on her hands, feet and heart, of the wounds corresponding with those received by Christ at his death.
crucification. The marks, however, were at her prayer not made visible. There is no need to doubt the reality of Catherine's exaltation, but it should be remembered that she and her circle were Dominicans, and that the stigmata of St Francis of Assisi were considered the crowning glory of the saint, and hitherto the exclusive boast of the Franciscans. The tendency observable in many of the austerities and miracles attributed to St Catherine to outstrip those of other saints, particularly Francis, is especially remarkable in this marvel of the stigmata, and so acute became the rivalry between the two orders that Pope Sixtus IV, himself a Franciscan, issued a decree asserting that St Francis had an exclusive monopoly of this particular wonder, and making it a censurable offense to represent St Francis receiving the stigmata.

In the year 1376, the 29th of Catherine's life, Gregory XI was living and holding the papal court at Avignon. He was the last of seven French popes in succession who had done so, and had perpetuated for seventy-three years what ecclesiastical works are fond of terming "the Babylonian captivity of the church." To put an end to this absenteeism, and to bring back the papacy to Italy was the cherished and anxious wish of all good Italians, and especially of all Italian churchmen. Petrarch had urgently pressed Urban V, Gregory's immediate predecessor, to accomplish the desired change; and Dante had at an earlier date laboured to bring about the same object. But these and all the other influences which Italy had striven to bring to bear on the popes had hitherto failed to induce them to return. In these circumstances Catherine determined to try her powers of persuasion and argument, attempting first by correspondence to reconcile Gregory and the Florentines, who had been placed under an interdict, and then going in person as the representative of the latter to Avignon, where she arrived on the 18th of June. Gregory empowered her to treat for peace, but the Florentine ambassadors were first tardy and then faithless. Nothing daunted, Catherine herself besought Gregory, who, however, was at the time minded to return, and he did so, in September, (taking the sea route from Marseilles to Genoa), though perhaps intending only to make a temporary stay in Italy. Catherine went home by land and stayed for a month in Genoa with Maddona Orietta Scotti, a noble lady of that city, at whose house Gregory had a long colloquy with her, which encouraged him to push on to Rome. To this year, 1376, belongs the admission to Catherine's circle of disciples of Stefano di Corrado Maconi, a Sienese noble distinguished by a character full of charm and purity, and his healing of the bitter feud between his family and the Tolomei. Another family quarrel, that of the Salimbene at Rocca D'Orca, was ended by her intervention in 1377. This year also she turned the castle of Belcaro, which had been given to her, into a monastery.

Meanwhile the returned pope was not having an easy time. Besides perpetuating the strife with his enemies he was also disagreeing with his friends, and finding it increasingly difficult to pay his mercenaries. He vented his anger upon Catherine, who reproved him for minding temporal rather than spiritual things, but in the beginning of 1378 sent her on an embassy to Florence and especially to the Guelph party. While she was urging the citizens to make peace with the pope there came the news of his death. During the troubles that ensued in Florence Catherine nearly lost her life in a popular tumult, and sorely regretted not winning her heart's desire, "the red rose of martyrdom." Peace was signed with the new pope, Urban VI, and Catherine, having thus accomplished her second great political task, went home again to Siena. Thence on the outbreak of the schism Urban summoned her to Rome, whither, somewhat reluctantly, she journeyed with her now large spiritual family in November. Once arrived she gave herself heartily to Urban's cause, and wore her slender powers out in restraining his impatient temper, quieting the revolt of the people of Rome and trying to win Urban the support of Europe. After prolonged and continual suffering she died on the 29th of April 1380.

Catherine of Siena lived not only in her writings but in her disciples. During her short course she gathered round her a devoted company of men and women trained to labour for the reformation of the individual, the church and the state. Her death naturally broke up the fellowship, but its members did not cease their activity and kept up what mutual correspondence was possible. Among them were Alfonso d'Este, who became master-general of the Dominicans, William Fleet, an ascetically-minded Englishman from Cambridge, Stefano Maconi, who joined the Carthusians and ultimately became prior-general, and the two secretaries, Neri di Landocchio and Francesco di Caffarini. The history of the life of Catherine, however, does not end in 1434, but the work was taken up, though in other shape, by Savonarola, between Francis of Assisi and whom Catherine forms the connecting link. Catherine's works consist of (1) a treatise occupying a closely-printed quarto volume, which Fra Raimondo describes as "a dialogue between a soul, which asked four questions of the Lord, and the same Lord, who made answer and gave instruction in many points of the soul's spiritual and bodily distress," and he terms him the Father of that class of spiritual monographs, which he terms the "Divina Commedia" as one of the two supreme attempts to express the eternal in the symbolism of a day, to paint the union of the soul with the super-sensible while still immersed in the flesh. The prayers (twenty-six in all) are mostly mystical outpourings repeating the aspirations found in her other writings. Of more interest are the letters, nearly four hundred in number, and addressed to kings, popes, cardinals, bishops, consuls, and many others. Their historical importance, their spiritual fragrance and their literary value combine to put their author almost on a level with Petrarch as a 14th century letter-writer. Her language is the purest Tuscan of the golden age of the Italian vernacular, and with spontaneity and force she makes no distinction between spiritual counsel, domestic advice and political guidance.

AUTHORITIES.—The sources for the personal life of Catherine of Siena are (1) the Vita or Legenda, Fra Raimondo's biography written 1414, of which an English version was made by Thomas Aquaini in 1414; (2) the Processus, a collection of testimonies and letters by those of her followers who survived in 1411, and had to justify the reverence paid to the memory of one yet uncanonized; (3) the book Opera in a passage on the "virgin," composed by Tommaso Aquaini in 1414; (4) the Legenda abbreviata, Caffarini's summary of the Vita, translated into beautiful Italian by Stefano Maconi; (5) the Letters, of which the standard edition is that of Girolamo Gigli (2 vols., Siena, 1710); another edition was published in London in 1821 by V. D. Scudder (London, 1905). A complete bibliography is given in E. G. Gardner's Saint Catherine of Siena, (London, 1907), a monumental study dealing with the religion, history and literature of the 14th century in Italy as they centre in the work and personality of one of the most wonderful women that have ever lived.

CATHERINE I. (1683-1727), empress of Russia. The true character and origin of this esmagitarian woman were, until quite recently, among the most obscure problems of Russian history. It now appears that she came of a Lithuanian stock, and was one of the four children of a small Catholic yeoman, Samuel Skovronskey; but her father died before she was a babe, the family scattered, and little Martha was adopted by Pastor Glück, the Protestant superintendent of the Marienburg district. Frau Glück finally rid herself of the girl by marrying her to a Swedish dragoon called Johan. A few months later, the Swedes were compelled by the Russians to evacuate Marienburg, and Martha became one of the prisoners of war of Marshal Sheremetev, who sold her to Prince Menshikov, at whose house, in the German suburb of Moscow, Peter the Great first beheld and made love to her in his own peculiar fashion. After the birth of their first daughter Catherine, Peter made no secret of their relations. He had found, at last, the woman he wanted, and she should be his, if possible, without her. The situation was regulated by the reception of Martha into the Orthodox Church, when she was rechristened unter the name of Catherine Alekseyevna, the tsarevich Alexis being her godfather, by the bestowal upon her of the title Gosudarinya or sovereign (1710),
and, finally (1711), by her public marriage to the tsar, who divorced the tsaritsa Eudoxia to make room for her. Henceforth the new tsaritsa was her husband's inseparable companion. She was with him during the campaign of the Pruth, and Peter always attributed the successful issue of that disastrous war to the courage and sang-froid of his consort. She was with him, too, during his earlier Caspian campaigns, and was obliged on this occasion to shear off her beautiful hair and wear a close-fitting fur cap to protect her from the rays of the sun.

By the ukas of 1722 Catherine was proclaimed Peter's successor, to the exclusion of the grand-duke Peter, the only son of the tsarевич Alexius, and on the 7th of May 1724 was solemnly crowned empress-consort in the Uspensky cathedral at Moscow, on which occasion she wore a crown studded with no fewer than 2,564 precious stones, surmounted by a ruby, as large as a pigeon's egg, supporting a cross of brilliants. Within a few months of this culminating triumph, she was threatened with utter ruin by the discovery of a supposed liaison with her gentleman of the bedchamber, William Mons, a handsome and unscrupulous upstart, and the brother of a former mistress of Peter. A dangerously familiar but perfectly innocent flirtation is, however, the worst that can fairly be alleged against Catherine on this occasion. So Peter also seemed to have thought, for though Mons was decapitated and his severed head, preserved in spirits, was placed in the apartments of the empress, she did not lose Peter's favour, attended him during his last illness, and closed his eyes when he expired (January 28, 1725). She was at once raised to the throne by the party of progress, as represented by Prince Menshikov and Count Tolstoy, whose interests and perils were identical with those of the empress, before the reactionary party had time to organize opposition, her great popularity with the army powerfully contributing to her success. The arch-priates of the Russian church, Theodosius, archbishop of Novgorod, and Theophanes, archbishop of Pskov, were also on her side for very much the same reason, both of them being unpopular innovators who felt that, at this crisis, they must stand or fall with Tolstoy and Menshikov.

The great administrative innovation of Catherine's reign was the establishment of the Verkhoomy Tainoi Sovet, or supreme privy council, by way of strengthening the executive, by concentrating affairs in the hands of a few persons, mainly of the party of Reform (Ukas of February 26, 1726). As to the foreign policy of Catherine I. (principally directed by the astute Andrei Osterman), if purely pacific and extremely cautious, it was, nevertheless, dignified, consistent and independent. Russia, by the mere force of circumstances, now found herself opposed to England, chiefly because Catherine protected Charles Frederick, duke of Holstein, and George I. found that the Schleswig-Holstein question might be reopened to the detriment of his Hanoverian possessions. Things came to such a pass that, in the spring of 1726, an English squadron was sent to the Baltic and cast anchor before Reval. The empress vigorously protested, and the fleet was withdrawn, but on the 6th of August Catherine acceded to the anti-English Austro-Russian league. Catherine died on the 16th of May 1727. Though quite illiterate, she was an uncommonly shrewd and sensible woman, and her character revealed a good nature under exceptionally difficult circumstances, testifies equally to the soundness of her heart and the goodness of her heart.

(R. N. B.)

CATHERINE II. (1729-1796), empress of Russia, was the daughter of Christian Augustus, prince of Anhalt-Zerbst, and his wife, Johanna Elizabeth of Holstein-Gottorp. The exact date and place of her birth have been disputed, but there appears to be no reason to doubt that she was right in saying that she was born at Stettin on the 2nd of May 1729. Her father, who succeeded to the principality of Anhalt-Zerbst in 1745 and died in 1747, was a general in the Prussian service, and, at the time of her birth, was military commandant at Stettin. Her baptismal name was Scphia Augusta Frederica. In accordance with the custom then prevailing in German princely families, she was educated chiefly by French governesses and tutors. In 1744 she was taken to Russia, to be affianced to the grand-duke Peter, the nephew of the empress Elizabeth (q.v.), and her recognized heir. The princess of Anhalt-Zerbst was the daughter of Christian Albert, bishop of Lübeck, younger brother of Frederick IV., duke of Holstein-Gottorp, Peter's paternal grandfather. The choice of her daughter as wife of the future tsar was the result of not a little diplomatic management in which Frederick the Great took an active part, the object being to strengthen the friendship between Prussia and Russia, to weaken the influence of Austria and to ruin the chancellor Bestuzhev, on whom Elizabeth relented, and who was a known partisan of the Austrian alliance. The diplomatic intrigue failed, largely through the flighty intervention of the princess of Anhalt-Zerbst, a clever but very indifferent woman. But Elizabeth took a strong liking to the daughter, and the marriage was finally decided on. The girl had spared no effort to ingratiate herself, not only with the empress, but with the grand-duke and the Russian people. She applied herself to learning the language with such zeal that she rose at night and walked about her bedroom barefoot repeating her lessons. The result was a severe attack of congestion of the lungs in March 1744. During the worst period of her illness she completed her conquest of the good-will of the Russians by declining the religious services of a Protestant pastor, and sending for Simon Todorskiy, the orthodox priest who had been appointed to instruct her in the Greek form of Christianity. When she wrote her memoirs she represented herself as having made up her mind when she came to Russia to do whatever had to be done, and to profess to believe whatever she was required to believe, in order to be qualified to wear the crown. The consistency of her character throughout life makes it highly probable that even at the age of fifteen she was mature enough to adopt this worldly-wise line of conduct. Her father, who was a convinced Lutheran, was strongly opposed to his daughter's conversion, and supplied her with books of controversy to protect her Protestantism. She read them, and she listened to Todorskiy and to other advisers who told her that the Russian crown was well worth a mass, or that the differences between the Greek and Lutheran churches were mere matters of form. On the 28th of June 1744 she was received into the Orthodox Church at Moscow, and was renamed Catherine Alexeyevna. On the following day she was formally betrothed, and was married to the archduke on the 21st of August 1745 at St Petersburg.

At that time Catherine was essentially what she was to remain till her death fifty-one years later. It was her boast that she was "frank and original as any Englishman." If she meant that she had a compact character, she was right. She had decided on her line in life and she followed it wholeheartedly. It was her determination to become a Russian in order that she might the better rule in Russia, and she succeeded. She acquired a full command of all the resources of the language, and a no less complete understanding of the nature of the Russian people. It is true that she remained quite impervious to religious influences. The circumstances of her conversion may have tended to render her indifferent to religion, but their influence need not be exaggerated. Her irreligion was shared by multitudes of contemporaries who had never been called upon to renounce one form of Christianity and profess belief in another in order to gain a crown. Her mere actions were, like those of other and humbler people, dictated by the conditions in which she lived. The first and the most important of them was beyond all question the misery of her married life. Her husband was a wretched creature. Nature had made him mean, the smallpox had made him hideous, and his degraded habits made him loathsome. And Peter had all the sentiments of the worst kind of small German prince of the time. He had the conviction that his princesship entitled him to disregard decency and the feelings of others. He planned brutal practical jokes, in which blows had always a share. His most manly taste did not rise above the kind of military interest which has been defined as "corporal's
mania,” the passion for uniforms, pipeclay, buttons, the “tricks of parade and the froth of discipline.” He detested the Russian dress, and surrounded himself with Holsteiners. For ten years the marriage was barren, and the only reason for supposing that the future tsar Paul (q.v.), who was born on the 2nd of October 1754, was the son of Peter, is the strong similarity of their characters. Living in the grossly animal court of the empress Elizabeth, bound to a husband whom she could not despise and detest, surrounded by suitors, and entirely uninfluenced by religion, Catherine became and remained perfectly immoral in her sexual relations to men. The scandalous chronicle of her life was the commonplace of all Europe. Her male favourites were as openly paraded as the female favourites of King Louis XV. It may be said once and for all that her most trusted agents while she was still grand-duchess, and her chief ministers when she became empress, were also her lovers, and were known to be so.

For some time after the marriage, the young couple were controlled by the empress Elizabeth, who appointed court officials to keep a watch on their conduct; but before long these custodians themselves had become the agents of Catherine’s pleasures and ambition. After the birth of Paul she began to take an active part in political intrigues. Her abilities forced even her husband to rely on her judiciousness. When in difficulty he ran to her and flattered her with the name of Madame la Ressource—Madame Quick Wit—which did not prevent him from insulting and even kicking her when the immediate need of her help was over. In 1758 he endeavoured to turn the empress Elizabeth against her, and for a time Catherine was in danger. She faced the peril boldly, and reconquered her influence over the sovereign, but from this time she must have realized that when the empress was dead she would have to defend herself against her husband. That Peter both hated and dreaded her was notorious. The empress Elizabeth died on the 5th of January 1762. The grand duke succeeded without opposition as Peter III. His behaviour to his wife continued to be brutal and menacing, and he went on as before offending the national sentiment of the Russian people. In July he committed the insane error of retiring with his Holsteiners to Oranienbaum, leaving his wife at St Petersburg. On the 13th and 14th of that month a “pronunciamiento” of the guards removed him from the throne and made Catherine empress. The history of this revolt is still obscure. It has naturally been said that she organized the mutiny from the first, and she justifiably is considered on this belief by the fact that the guards were manipulated by the French orlov brothers. The eldest, Gregory, was her recognized chief lover, and he was associated with his brother Alexis in the office of favourite. On the other hand, there does not appear to have been any need for organization. The hatred felt for Peter III. was spontaneous, and Catherine had no need to do more than let it be known that she was prepared to profit by her husband’s downfall. Peter, who behaved with abject cowardice, was sent to a country house at Ropcha, where he died on the 15th or 18th of July of official “apoplexy.” The truth is not known, and Frederick the Great at least professed long afterwards to believe that Catherine had no immediate share in the murder. She had no need to speak. Common-sense must have shown the leaders of the revolt that they would never be safe while Peter lived, and they had insults to avenge.

The mere fact that Catherine II., a small German princess without hereditary claim to the throne, ruled Russia from 1762 to 1796 amid the loyalty of the great mass of the people, and the respect and admiration of her neighbours, is sufficient proof of the force of her character. Her title to be considered a great reforming ruler is by no means equally clear. Various encyclopaedists with whom she corresponded, and on whom she conferred gifts and pensions, repaid her by the grossest flattery, while doing their best to profit by her generosity. They made her a reputation for “philosophy,” and showed the sincerity of their own love of freedom by finding excuses for the partition of Poland. There is a very great difference between Catherine II. as she appears in the panegyrics of the encyclopaedists and Catherine as she appears in her correspondence and in her acts. Her foreign admirers amused her, and were useful in spreading her reputation. The money they cost her was a small sum in comparison to the £12,000,000 she lavished on her long series of lovers, who began with Soltykov and Stanislaus Poniatowski (q.v.) before she came to the throne, and ended with the youthful Platon Zubov, who was tenant of the post at her death. She spent money freely on purchasing works of art and curios. Yet she confessed with her usual candour that she had no taste for painting, sculpture or music. Her supposed love of literature does not appear to have amounted to more than a lively curiosity, which could be satisfied by dipping into a great number of books. She had a passion for writing, and produced not only a mass of letters written in French, but pamphlets and plays, comic and serious, in French and Russian. One on the history of Oleg, the more or less legendary Varangian, who was guardian to the son of Kurik, was described by her as an “imitation of Shakespear.” The scheme is not unlike that of a “chronicle play.” Her letters are full of vivacity, of colour, and at times of insight and wit, but she never learnt to write either French or German correctly. The letters to Voltaire attributed to her are not hers, and were probably composed for her by Andrei Shuvalov. The philosophers and encyclopaedists who, by the mouth of Diderot, complimented Catherine on being superior to such female falconers as Madame du Deffand, and Flattery, flattered her to some extent even here. She endeavoured to flatter herself, and to hold, was herself temperate in eating and drinking, and was by no means tolerant of disorderly behaviour on the part of the ladies of her court. They flattered her much more when they dwelt on her philanthropy and her large share of the enlightenment of the age. She was kind to her servants, and was very fond of young children. She was rarely angry with people who merely contradicted her or failed to perform their service in her household. But she could order the use of the knout and of mutilation as freely as the most barbarous of her predecessors when she thought the authority of the state was at stake, and she did employ them readily to suppress all opinions of a heterodox kind, whether in matters of religion or of politics, after the beginning of the French Revolution. Her renowned toleration stopped short of allowing the dissenters to build chapels, and her passion for legislative reform grew cold when she found that she must begin by the emancipation of the serfs. There were exceptions even to her personal kindness to those about her. She dropped her German relations. She kept a son born to her shortly before the revolution among those whose paternity could not be attributed to Peter, at a distance, through the house of a house-tenant, was herself brought up in a private station under the name of Bobrinski. She was a harsh mother to her son Paul. It seems highly probable that she intended to exclude him from the succession, and to leave the crown to her eldest grandson Alexander, afterwards the emperor Alexander I. Her harshness to Paul was probably as much due to political distrust as to what she saw of his character. Whatever else Catherine may have been she was emphatically a sovereign and a politician who was in the last resort guided by the reason of state. She was resolved not to allow her authority to be disputed by her son, or shared by him.

As a ruler, Catherine professed a great contempt for system, which she said she had been taught to despise by her master Voltaire. She declared that in politics a capable ruler must be guided by “circumstances, conjectures and conjunctions.” Her conduct was on the surface very unstable. In a moment of candour she confessed that she was a great commensurate—that she had a mania for beginning innumerable enterprises which she never pursued. This, however, is chiefly true of her internal administration, and even there it should be qualified. Many of her beginnings were carried on by others and were not barren. Her foreign policy was as consistent as it could be considering the forces she had to contend against. It was steadily aimed to secure the greatness and the safety of Russia. There can be no question that she loved her adopted country sincerely, and had an affection for her people, and an opinion of their great qualities which she did not hesitate to express in hyperbolical terms. Her zeal for the reputation of the Russians...
Catherine De' Medici

was almost comically shown by the immense trouble she took to compile an answer to the *Voyage en Sibérie* of the French astronomer Chappe d'Autecho. The book is in three big quarto's, and Catherine's answer which was never finished is still larger. Chappe d'Autecho had discovered that Siberia was not a paradise, and had observed that the Russians were dirty in their habits, and that masters whipped their servants, male and female. Her patriotism was less innocently shown by her conquests. Yet it may be doubted whether any capable ruler of Russia could have abstained from aggressions at the expense of the rights of the Saxony family in Courland, of Poland, and of Turkey (see Russia: History). It does seem now to be clearly proved that the partition of Poland was not suggested by her, as has been frequently asserted. Catherine would have preferred to control the country through a vassal sovereign of the type of Stanislaus Poniatowski, the old lover whose election she secured in 1763. Poland was incapable of maintaining its independence at the time of the first partition (1772), and the division of the unhappy country was forced on by Austria and Prussia. In the case of the second partition in 1793, she did show herself to be very unscrupulous. Her opposition to the reform of the Polish government was plainly due to a wish to preserve an excuse for further spoliation, but her conduct was less cruel and base than that of Prussia.

Catherine had adhered to her husband's policy of a Prussian alliance. While Frederick the Great lived he was impressed by his ability. But the Prussian alliance became hateful to her, and her later correspondence with Grimm overflows with contempt of his successor Frederick William II., who is always spoken of by her as "Brother Gu." Her exasperation with the affectations of the Prussian king was unquestionably increased by her discovery that he would not be induced to apply himself to a crusade against the French Revolution, which by employing all his forces would have left Russia free to annex the whole of what remained of Poland. But at least she did not enter into a solemn engagement to defend the Poles who were engaged in reforming their constitution, and then throw them over in order to share in the plunder of their country.

Catherine's Turkish policy was at first marked by a certain grandiosity. When the Turks declared war in 1788 in order to support Poland, which they looked upon as a necessary buffer state, she retaliated by the great Greek scheme. For a time it was a pet idea with her to revive the Greek empire, and to plant the cross, with the double-headed Russian eagle, at Constantiropole. She formed a corps of Greek cadets, caused her younger grandson to be christened Constantine, and began the policy of presenting Russia as the centre of the Greek world. In pursuit of this heroic enterprise, which excited the loud admiration of Voltaire, she sent a fleet under Alexis Orlov into the Mediterranean in 1779. Orlov tempted the Greeks of the Morea to take up arms, and then left them in the lurch. When Catherine found herself opposed by the policy of France and England, and threatened by the jealousy of Prussia and Austria, she dropped the Greek design, observing to Voltaire that the descendants of the Spartans were much degenerated. The introduction into the treaty of Kuchuk-Kainarji of 1774 of a clause by which the Porte guaranteed the rights of its Christian subjects, and of another giving Russia the right to interfere on behalf of a new Russian church in Constantinoplis, advertised the claim of the tsars to be the natural protectors of the Orthodox in the Ottoman dominions; but when she took up arms again in 1788 in alliance with Joseph II. (q.v.), it was to make a mere war of conquest and partition. The Turkish wars show the weak side of Catherine as a ruler. Though she had mounted the throne by a military revolt and entered on great schemes of conquest, she never took an intelligent interest in her army. She neglected it in peace, allowed it to be shamefully administered in war, and could never be made to understand that it was not in her power to improvise generals out of her favourites. It is to her credit that she saw the capacity of Suvarov, yet she never had as much confidence in him as she had in Potemkin, who may have been a man of genius, but was certainly no general. She took care never to have to deal with a disciplined opponent, except the Swedes, who beat her, but who were very few. It was to the happiness of Catherine that she lived too long. She maintained herself by living with her last lover, Zubov, when she was a woman of seventy, trusting him with power and lavishing public money on him. The outbreak of the French Revolution stripped off the varnish of philosophy and philanthropy which she had assumed in earlier years. She had always entertained a quiet contempt for the French writers whom she flattered and pensioned, and who served her as an advertising agency in the west. When the result of their teaching was seen in Paris, good-natured contempt was turned to hatred. She then became a persecutor in her own dominions of the very ideas she had encouraged in former years. She scolded and preached a crusade, without, however, departing from the steady pursuit of her own interests in Poland, while endeavouring with transparent cunning to push Austria and Russia into an invasion of France with all their forces. Her health began to break down, and it appears to be nearly certain that towards the end she suffered from hysteria of a shameful kind. It is plain that her intellect had begun to fail just before her death, for she allowed the reigning favourite, Platon Zubov, to persuade her to depose his brother Valerian, with the rank of field marshal and an army of ten thousand men; on condition that he should be made a prince of Persia and Tibet. The refusal of the king of Sweden to marry into her family unless the bride would become a Lutheran is said to have thrown her into a convulsion of rage which hastened her death. On the 9th of November 1796, she was seized by a fit of apoplexy, and died on the evening of the 10th.

All other accounts of Catherine II. have been superseded by Baliszewski's two volumes, _Le Roman d'une impératrice_ (Paris, 1893) and _Autour d'un Trône: Catherine II., ses collaborateurs, ses amis, ses ennemis_ (Paris, 1894). The original sources of her policy and her character are to be found in the publications of the Imperial Russian Historical Society, vols. i.-cix. (St. Petersburg), begun in 1867; her private and official correspondence will be found in vols. i., ii., iv., v., vi., vii., viii., ix., x., xii., xiv., xvii., xx., xxx., xxxi., xxxii., xxxiv., xxxv., xxxvi., xxxvii., i., ii., lvii., lviii., lxxvii., lxxxvii., lxxxviii., lxxv., lxxvi., lxxvii., lxxviii., lxxix., xxxv., cxxvii., etc. Catherine De' Medici (1519-1589), queen of France, the wife of one French king and the mother of three, was born at Florence in 1519. She was a daughter of Lorenzo II. de' Medici and a French princess, Madeleine de la Tour d'Auvergne. Having lost both her parents at an early age, Catherine was sent to a convent to be educated; and she was only fourteen when she was married (1533) at Marseilles to the duke of Orleans, afterwards Henry II. It was her uncle, Pope Clement VII., who arranged the marriage with Francis I. Francis, still engaged in his lifelong task of making head against Charles V., was only too glad of the opportunity to strengthen his influence in the Italian peninsula, while Clement, ever needful of help against his too powerful protector, was equally ready to hold out a bait. During the reign of Francis, Catherine exercised no influence in France. She was young, a foreigner, a member of a state that had almost no weight in the great world of politics, had not given any proof of great ability, and was thrown into the shade by more important persons. For ten years after her marriage she had no children. In consequence, a divorce began to be talked of at court; and it seemed not impossible that Francis, alarmed at the possible extinction of the royal house, might listen to such a proposal. But Catherine had the happiness of bringing him grandchildren ere he died. During the reign of her husband, too (1547-1559), Catherine lived a quiet and passive, but observant life. Henry being completely under the influence of his mistress, Diane de Poitiers, she had little authority. In 1552, when the king left the kingdom for the campaign of Metz, she was nominated regent, but with very limited powers. This continued even after the accession of her son Francis II. Francis was under the spell of Mary Stuart, and she, little disposed to meddle with politics on her own account, was managed by her uncles, the cardinal of Lorraine and the duke of Guise. The queen-mother, however, soon grew weary of the domination of the Guises, and entered upon a course of secret opposition. On the 1st of April 1559 she placed in the

529

chancellorship Michel de l'Hôpital (q.v.), who advocated the policy of conciliation. On the death of Francis (5th of December 1510), Catherine became regent during the minority of her second son, Charles IX., and was found before her a career worthy of the most sober ambition. She was then forty-one years old, but, although she was the mother of nine children, she was still very vigorous and active. She retained her influence for more than twenty years in the troubled period of the wars of religion. At first she listened to the moderate counsels of l'Hôpital in so far as to avoid siding definitely with either party, but her character and the habits of policy to which she had been accustomed, rendered her incapable of any noble aim. She had only one virtue, and that was her zeal for the interests of her children, especially of her favourite third son, the duke of Anjou. Like so many of the Italians of that time, who were almost destitute of a moral sense, she looked upon statesmanship in particular as a career in which finery, lying and assassination were the most admirable, because the most effective weapons. By habit a Catholic, but above all things fond of power, she was determined to prevent the Protestants from getting the upper hand, and almost equally resolved not to allow them to be utterly crushed, in order to use them as a counterpoise to the Guises. This ambiguous policy met with little success: rage and suspicion so possessed men's minds, that she could no longer control the opposing parties, and one civil war followed another to the end of her life. In 1567, after the "Enterprise of Meaux," she dismissed l'Hôpital and joined the Catholic party. But, having failed to crush the Protestant rebellion by arms, she resumed in 1570 the policy of peace and negotiation. She conceived the project of marrying her favourite son, the duke of Anjou, to Queen Elizabeth of England, and her daughter Margaret to Henry of Navarre. To this end she became reconciled with the Protestants, and allowed Coligny to return to court and to re-enter the council. Of this step she quickly repented. Charles IX. conceived a great affection for the admiral and showed signs of taking up an independent attitude. Catherine, thinking her influence menaced, sought to regain it, first by the murder of Coligny, and, when that had failed, by the massacre of St. Bartholomew (q.v.). The whole of the responsibility for this crime, therefore, rests with Catherine; unlike the populace, she had not even the excuse of fanaticism. This responsibility, however, she weighed but lightly on; while her son was overwhelmed with remorse, she calmly enjoyed her short-lived triumph. After the death of Charles in 1574, and the succession of Anjou under the name of Henry III., Catherine pursued her old policy of compromise and concessions; but as her influence is lost in that of her son, it is unnecessary to dwell upon it. She died on the 5th of January 1589, a short time before the assassination of Henry, and the consequent extinction of the House of Valois. In her taste for art and her love of magnificence and luxury, Catherine was a true Medici; her banquets at Fontainebleau in 1564 were famous for their sumptuousness. In architecture especially she was well versed, and Philibert de l'Orme relates that she discussed with him the plan and decoration of her palace of the Tuileries. Catherine's policy provoked a crowd of pamphlets, the most celebrated being the Discours merveilleux de la vie, actions et déportements de la reine Catherine de Médicis, in which Henri Estienne undoubtedly collaborated.

Baschet, 1866); H. Bouchot, Catherine de Médicis (Paris, 1899). For a more complete bibliography see Ernest Lavisse, Histoire de France (vol. vii., 1898, and vol. vii., by J. H. Marijoli, 1904-1905). See also Miss E. Richel's book, Catherine de' Medici and the French Reformation (1908), and The Later Years of Catherine de' Medici (1908).

Catherine of Aragon (1485-1536), queen of Henry VIII. of England, daughter of Ferdinand and Isabella of Spain, was born on the 15th or 16th of December 1485. She left Spain in 1501 to marry Arthur, prince of Wales, eldest son of King Henry VII., and landed at Plymouth on the 2nd of October. The wedding took place on the 14th of November in London, and soon afterwards Catherine accompanied her youthful husband to Wales, where, in his sixteenth year, the prince died on the 7th of April 1502. On the 25th of June 1503, she was formally betrothed to the king's second son, Henry, now prince of Wales, and a papal dispensation for the alliance was obtained. The marriage, however, did not take place during the lifetime of Henry VII. Ferdinand endeavoured to cheat the English king of the marriage portion agreed upon, and Henry made use of the presence of the unmarried princess in England to extort new conditions, and especially to secure the marriage of his daughter Mary to the archduke Charles, grandson of Ferdinand, and afterwards Charles V. Catherine was thus from the first the unhappy victim of state politics. Writing to Ferdinand on the 9th of March 1509, she describes the state of poverty to which she was reduced, and declares the king's unkindness impossible to be borne any longer.1 On the old king's death, however, a brighter prospect opened, for Henry VIII. decided immediately on marrying her, the wedding taking place on the 11th of June and the coronation on the 24th. Catherine now enjoyed a few years of married happiness; Henry showed himself an affectionate husband, and the alliance with Ferdinand was maintained against France. During Henry's invasion of France in 1513 she was made regent; she showed great zeal and arduous in the preparations for the Scottish expedition, and was riding towards the north to put herself at the head of the troops when the victory of Flodden Field ended the campaign. The following year an affectionate meeting took place between the king and queen at Richmond on the return of the former. Ferdinand's treachery, however, in making a treaty with France roused Henry's wrath, and his angry reproaches fell upon his unfortunate wife; but she took occasion in 1520, during the visit of her nephew Charles V. to England, to urge the policy of gaining his alliance rather than that of France. Immediately on his departure, on the 31st of May 1520, she accompanied the king to France, on the celebrated visit to Francis I., called from its splendour the Field of the Cloth of Gold; but in 1522 war was declared against France and the emperor again welcomed to England. In 1521 she is represented by Shakespeare as pleading for the unfortunate wife of King Henry.

These early years of happiness and of useful influence and activity had, however, been gradually giving way to gloom and disappointment. Between January 1518 and November 1518 Catherine gave birth to six children (including two princes), who were all stillborn or died in infancy except Mary, born in 1516, and rumour did not fail to ascribe this series of disasters to the curse pronounced in Deuteronomy on incestuous unions. In 1526 the condition of Catherine's health made it highly improbable that she would have more children. No woman had ever reigned in England, alone and in her own right, and to avoid a fresh dispute concerning the succession, and the revival of the civil war, a male heir to the throne was a pressing necessity. The act of marriage, which depended for its validity on the decision of the ecclesiastical courts, had, on account of the numerous dissolutions and dispensations granted, not then attained the security since assured to it by the secular law. For obtaining dissolutions of royal marriages the facilities were especially great. Pope Clement VII. himself permitted such a dissolution in the case of Henry's own sister Margaret, in 1526, proposed later as a solution of the problem that his Holiness would be allowed two wives,6 and looked not unfavourably, with the same aim, on the project for marrying the duke of Richmond to Mary, a brother to a sister.7 In Henry's case also the irregularity of a union, which is still generally repudiated and forbidden in Christendom, and which it was very doubtful that the pope had the power to legalize, provided a moral justification for a dissolution which in other cases did not exist. It was not therefore the immorality of the plea which obstructed the papal decree in

Henry's favour, but the unlucky imprisonment at this time of
Clement VII. at the hands of Charles V., Catherine's nephew,
which obliged the pope, placed thus between the hammer and
the anvil, to make a policy of delay and hesitation. Nor was
the immorality of Henry's own character the primary cause
of the project of divorce. Had this been so, a succession of mis-
tresses would have served as well as a series of single wives.
The real occasion was the king's desire for a male heir.
But, however clear this may be, the injustice done to Catherine
was no less cruel and real. Rumours, probably then unfounded,
of an intended divorce had been heard abroad as early as 1524.
But the creation in 1525 of the king's illegitimate son Henry,
as duke of Richmond—the title borne by his grandfather Henry
VII—and the precedent granted to him over all the peers as
well as the princess Mary, together with the special honour paid
at this time by the king to his own half-sister Mary, were the
first real indications of the king's thoughts. In 1526, and
perhaps earlier, Wolsey had been making tentative inquiries
at Rome on the subject. In May 1527 a collusive and secret
suit was begun at the cardinal, who, as legate, summoned
the king to defend himself from the charge of cohabitation with
his brother's wife; but these proceedings were dropped. On
the 22nd of June Henry informed Catherine that they had been
living in mortal sin and must separate. During Wolsey's absence
in July at Paris, where he had been commissioned to discuss
vaguely the divorce and annulment questions with residence
of Louis XII. in France, Anne Boleyn is first heard of in connexion
with the king, his affection for her having, however, begun probably as
early as 1523, and the cardinal on his return found her openly
installed at the court. In October 1528 the pope issued a
commission to Cardinal Campeggio and Wolsey to try the
cause in England, and bound himself not to revoke the case
to Rome, confirming his promise by a secret decretal commission
which, however, was destroyed by Campeggio. But the trial
was a sham. Campeggio was forbidden to pronounce sentence
without further reference to Rome, and was instructed to create
delays, the pope assuring Charles V. at the same time that the
case should be ultimately revoked to Rome.  
The object of all parties was now to persuade Catherine to
enter a nunneries and thus relieve them of further embarrassment.
While Henry's envoys were encouraged at Rome in believing
that he might then make another marriage, Henry himself gave
Catherine assurances that no other union would be contemplated
in her lifetime. But Catherine with courage and dignity held
fast to her rights, demanded a proper trial, and appealed not only
to the bull of dispensation, the validity of which was said to be
vitiating by certain irregularities, but to a brief granted for the
affair of his niece, the princess Mary, by Pope Julius II. Henry declared the latter to be a
forgery, and endeavoured unsuccessfully to procure a declaration
of its falsity from the pope. The court of the legates accordingly
opened on the 31st of May 1529, the queen appearing before
it on the 18th of June for the purpose of denying its jurisdiction.
On the 21st both Henry and Catherine presented themselves
before the tribunal, when the queen threw herself at Henry's
feet and appealed for the last time to his sense of honour, recalling
her own virtue and helplessness. Henry replied with kindness,
showing that her wish for the revocation of the cause to Rome
was unreasonable in view of the paramount influence then
exercised by Charles V. on the pope. Catherine nevertheless
persisted in making appeal to Rome, and then withdrew. After
her departure Henry, according to Cavendish, Wolsey's biog-
grapher, praised her virtues to the court. "She is, my lords,
as true, as obedient, as conformable a wife as I could in my
phantasy wish or desire. She hath all the virtues and qualities
that ought to be in a woman of her dignity or in any other of
baser estate." On her refusal to return, her plea was overruled
and she was adjudged contumacious, while the sittings of the
court continued in her absence. Subsequently the legates paid
her a private visit of advice, but were unable to move her from
her resolution. Finally, however, in July 1529, the case was,
according to her wish, and as the result of the treaty of Barcelona
and the pope's complete surrender to Charles V., revoked by the
pope to Rome: a momentous act, which decided Henry's future attitude, and occasioned the downfall of the whole papal
authority in England. On the 7th of March 1530 Pope Clement
issued a brief forbidding Henry to make a second marriage,
and ordering the restitution of Catherine to her rights till the
cause was determined; while at the same time he professed to
the French ambassador, the bishop of Tarbes, his pleasure
should the marriage with Anne Boleyn have been already made,
if only it were not by his authority.  The same year Henry
obtained opinions favourable to the divorce from the English,
French and most of the Italian universities, but unfavourable
answers from Germany, while a large number of English peers
and ecclesiastics, including Wolsey and Archbishop Warham,
joined in a memorial to the pope in support of Henry's case.
Meanwhile, Catherine, while the great question remained
unsolved, was still treated by Henry as his queen, and accom-
panied him in his visits in the provinces and in his hunting
expeditions. On the 31st of May 1531 she was visited by thirty
privy councils, who urged the trial of the case in England, but
they met only with a firm refusal. On the 14th of July Henry
left his wife at Windsor, removing himself to Woodstock, and
never saw her again. In August she was ordered to reside at the
Moor in Hertfordshire, and at the same time separated from
the princess Mary, who was taken to Richmond. In October
she again received a deputation of privy councillors, and again
refused to return to York from Rome. In 1532 she sent the
king a gold cup as a new year's gift, which the latter refused,
and she was forbidden to hold any communication with him.
Alone and helpless in confronting Henry's absolute power, her
cause found champions and sympathizers among the people,
among the court preachers, and in the House of Commons, while
Bishop Fisher had openly taken her part in the legatine trial.
Subsequently Catherine was removed to Bishops Hatfield,
while Henry and Anne Boleyn visited Francis I. Their marriage,
anticipating any sentence of the nullity of the union with
Catherine, took place after their return about the 25th of January
1533, in consequence of Anne's pregnancy. On the 10th of Mary
Cranmer, for whose consecration as archbishop of Canterbury
Henry had obtained bulls from Rome, opened his club, and
declared on the 23rd the nullity of Catherine's marriage and the
validity of Anne's. On the 10th of August the king caused
proclamation to be made forbidding her the style of queen;
but Catherine refused resolutely to yield the title for that of princess-
dowager. Not long afterwards she was removed to Buckden
in Huntingdonshire. Here her household was considerably
reduced, and she found herself hemmed in by spies, and in fact
a prisoner. In July she had refused Henry the loan of a certain
rich cloth, which had done service at the baptism of her children,
for the use of Anne Boleyn's expected infant; and on the birth
of Elizabeth and the refusal of Mary to give up the title of princess,
the latter's household was entirely dismissed and she herself
reduced to the position of attendant in Elizabeth's retinue.
A project for removing Catherine from Buckden to Somersham,
an unhealthy solitude in the isle of Ely, with a still narrower
maintenance, was only prevented by her own determined resist-
ance. The attempt in November to incarcerate the queen in
connexion with Elizabeth Barton failed. She passed her life
now in religious devotions, taking strict precautions against the
possibility of being poisoned. On the 23rd of March 1534
the pope pronounced her marriage valid, but by this time England
had thrown off the papal jurisdiction, the parliament had trans-
ferred Catherine's jointure to Anne Boleyn, and the decree had
no effect on Catherine's fortunes. She refused to swear to the
new act of succession, which declared her marriage null and Anne's
infant the heir to the throne, and soon afterwards she was
removed to Kimbolton, where she was well treated. On the 21st
of May she was visited by the archbishop of York and Tunstall,
bishop of Durham, who threatened her with death if she per-
sisted in her refusal, but only succeeded in confirming her res-
solution. She was kept in strict seclusion, separated from Mary

1 Col. of State Pap., England and Spain, iii. pt. ii. 779.
2 Ed. of State Pap., Foreign and Dom., iv. 6290.
and from all outside communications, and in December 1535 her health gave way, her death taking place on the 8th of January 1536, not without suspicions of poison, which, however, may be dismissed. She was buried by the king's order in Peterborough cathedral. Before her death she dictated a last letter to Henry, according to Polydore Vergil, expressing her forgiveness, begging his good offices for Mary, and concluding with the astounding assurance—"I vow that mine eyes desire you above all things." The king himself affected no sorrow at her death, and thanked God there was now no fear of war.

Catherine is described as "rather ugly than otherwise; of low stature and rather stout; very good and very religious; speaks Spanish, French, Flemish, English; more beloved by the islanders than any queen that has ever reigned." She was a woman of considerable education and culture, her scholarship and knowledge of the Bible being noted by Erasmus, who dedicated to her his book on Christian Marriage in 1526. She endured her bitter and underhand misfortunes with extra-ordinary courage and resolution, and at the same time with great womanly forbearance, of which a striking instance was the compassion shown by her for the fallen Wolsey.

BIBLIOGRAPHY.—See the article in Dict. of Nat. Biot, by J. Gairdner, and those on Henry VIII. and Wolsey, where the case is summed up very adversely to Henry, and The Divorce of Catherine of Aragon (1880) by A. F. Pollard is regarded as the contrary aspect; Henry VIII. by A. F. Pollard (1905): Cambridge Mod. Hist. (1903), ii. 416 et seq. and bibliographies, p. 789; The Wives of Henry VIII., by M. Hume (1905). (P. C. Y.)

CATHERINE OF BRAGANZA (1638-1705), queen consort of Charles II. of England, daughter of John IV. of Portugal, and of Louisa de Guzman, daughter of the duke of Medina Sidonia, was born on the 13/5 of November 1638 at Villa Viçosa. She was early regarded as a useful medium for contracting an alliance with England, more necessary than ever to Portugal after the treaty of the Pyrenees in 1659 whereby Portugal was ostensibly abandoned by France. Negotiations for the marriage began during the reign of Charles I., were renewed immediately after the Restoration, and on the 23rd of June, in spite of Spanish opposition, the marriage contract was signed, England securing Tangier and Bombay, with trading privileges in Brazil and the East Indies, religious and commercial freedom in Portugal and two million Portuguese crowns (about £500,000); while Portugal obtained military and naval support against Spain and liberty of worship for Catherine. She reached England on the 13th of May 1662, but was not visited by Charles at Portsmouth till the 20th. The next day the marriage was solemnized twice, according to the Roman Catholic and Anglican usages. Catherine possessed several good qualities, but had been brought up in a convent, and was scarcely a wife Charles would have chosen for himself. Her personal charms were not potent enough to weaken Charles away from the society of his mistresses, and in a few weeks after her arrival she became aware of her painful and humilitating position as the wife of the selfish and licentious king. On the first presentation to her of Lady Castlemaine, Charles's mistress en titre, whom he insisted on making lady of his bedchamber, she fainted away. She withdrew from the king's society, and in spite of Clarendon's attempts to moderate her resentment, declared she would return to Portugal rather than consent to a base compliance. To overcome her resistance nearly the whole of her Portuguese retinue was dismissed. She was helpless, and the violence of her grief and anger soon changed to passive resistance, and then to a complete forbearance and compliance which gained the king's regard and favour. In the midst of Charles's love for Castlemaine and licentious court, she lived neglected and despised, often deprived of her due allowance, having no ambitions and taking no part in English politics, but keeping up rather her interest in her native country.

As the prospect diminished of her bearing children to Charles, several were set on foot for procuring a divorce on various pretexts. As a Roman Catholic and near to the king's person Catherine was the special object of attack by the inventors of the Popish Plot. In 1678 the murder of Sir Edmund Berry Godfrey was ascribed to her servants, and Titus Oates accused her of a design to poison the king. These charges, of which the absurdity was soon shown by cross-examination, nevertheless placed the queen for some time in great danger. On the 28th of November Oates accused her of high treason, and the Commons passed an address for her removal and that of all the Roman Catholics from Whitehall. A series of fresh depositions were sent in against her, and in June 1679 it was decided that she must stand her trial; but she was protected by the king, who, in this instance showed unusual chivalry and earned her gratitude. On the 17th of November Shaftesbury moved in the House of Lords for a divorce to enable the king to marry a Protestant and have legitimate issue; but he received little support, and the bill was opposed by Charles, who continued to show his wife "extraordinary affection." During the winter the calumnies against the queen were revived by Fitzharris, who, however, before his execution in 1685 confessed to their falsity; and after the revival of the king's influence subsequent to the Oxford parliament, the queen's position was no more assailed.

During Charles's last illness in 1667 she showed great anxiety for his reconciliation with the Romish Church, and it was probably effected largely through her influence. She exhibited great grief at his death. She afterwards resided at Somerset House and at Hammersmith, where she had privately founded a convent. She interceded with great generosity, but ineffectually, for Monmouth the same year. On the 10th of June 1688 she was present at the birth of the prince of Wales and gave evidence before the council in favour of the genuineness of the child. She was still in England at the Revolution, having delayed her return to Portugal to prosecute a lawsuit against the second earl of Clarendon, formerly her chamberlain. She maintained at first good terms with William and Mary; but the practice of her religion aroused jealousies, while her establishment at Somerset House was said to be the home of cabals against the government; and in 1691 she settled for a short time at Euston. She left England finally with a train of one hundred persons in March 1692, travelling through France and arriving at Lisbon on the 20th of January 1693. She took up her residence at the palace of Bemposta, built by herself, near Lisbon. In 1703 she supported the Methuen Treaty, which cemented still further the alliance between Portugal and England, and in 1704 she was appointed regent of Portugal during the illness of her brother King Pedro II., her administration being distinguished by several successes gained over the Spaniards. She died on the 31st of December 1705, bequeathing her great wealth, the result of long hoarding, after the payment of divers charitable legacies, to King Pedro; and was buried with great ceremony and splendour at Batalha.

See E. C. Davidson, Catherine of Braganza (1908).

CATHERINE OF VALOIS (1401-1437), queen of Henry V. of England, daughter of Charles VI. of France by his wife Isabel of Bavaria, was born in Paris on the 27th of October 1401. The lunacy of her father and the depravity of her mother were serious drawbacks to Catherine, and her only education was obtained in a convent at Poissy. About 1408 a marriage was suggested between the princess and Henry, prince of Wales, afterwards Henry V., who renewed this proposal after he became king in March 1413. In addition to the hand of Catherine, however, the English king asked for a large dowry both in money and lands, and when these demands were rejected war broke out. Once or twice during short intervals of peace the marriage project was revived, and was favoured by Queen Isabel. When peace was eventually made at Troyes in May 1420, Henry and Catherine were betrothed, and the marriage took place at Troyes on the 2nd of June 1420. Having crossed to England with Henry, the queen was crowned in Westminster Abbey on the 23rd of February 1421, and in the following December gave birth to a son, afterwards King Henry VI. She joined Henry in France in May 1422, returning to England after his death in the succeeding August. Catherine's name soon began to be coupled with that of Owen Tudor, a Welsh gentleman, and in 1428 Humphrey, duke of Gloucester, secured the passing of an act to prevent her from marrying without the
consent of the king and council. It appears, however, that by this time Catherine and Tudor were already married. They lived in obscurity till 1436, when Tudor was imprisoned, and Catherine retired to Bermondsey Abbey, where she died on the 3rd of January 1437. Her body was buried in the Lady chapel of Westminster Abbey, and when the chapel was pulled down during the reign of Henry VII., was placed in Henry V.'s tomb. It lay afterwards under the Villiera monument, and in 1878 was re-buried in Henry V.'s chantry. By Tudor Catherine had three sons and a daughter. Her eldest son by this marriage, Edmund, was created earl of Richmond in 1452, and was the father of Henry VII.

**CATHETUS** (Gr. καθετος, a perpendicular line), in architecture the eye of the volute, so termed because its position is determined, in an Ionic or voluted capital, by a line let down from the point in which the volute generates.

**CATHOLIC** (Gr. καθολικος, general, universal), a designation adopted in the 2nd century by the Christian Church to indicate Christendom as a whole, in contrast with individual churches. With this idea went the notions that Christianity had been defunct and that the whole body of Christendom has continued to be in unity only where it found everywhere throughout the church could be true. The term thus in time became full of dogmatic and political meaning, connoting, when applied to the church, a universal authoritative and orthodox society, as opposed to Gnostic and other "sects" (cf. the famous canon of Vincent of Lerins A.D. 434; quod ubique, quod semper, quod ab omnibus credidum est). The term "Catholic" does not occur in the old Roman symbol; but Professor Loofs includes it in his reconstruction, based on typical phrases in common use at the time of the ante-Nicene creeds of the East. In the original form of the Nicene creed itself it does not occur; but in the creed of Jerusalem (348), an amplification of the Nicene symbol, we find "one Holy Catholic Church," and in the revision by Cyril of Alexandria (362) "Catholic and Apostolic Church" (see CREEDS). Thus, though the word "Catholic" was late in finding its way into the formal symbols of the church, it is clear that it had long been in use in the original sense defined above. It must be borne in mind, however, that the designation "Catholic" was equally claimed by all the warring parties within the church at various times; thus, the followers of Arius and Athanasius alike called themselves Catholics, and it was only the ultimate victory of the latter that has reserved for them in history the name of Catholic, and branded the former as Arian.

With the gradual development and stereotyping of the creed it was inevitable that the term "Catholic" should come to imply a more narrowly defined orthodoxy. In the Eastern churches, indeed, the conception of the church as the guardian of "the faith once delivered to the saints" soon overshadowed that of interpretation and development by catholic consent, and, though they have throughout claimed the title of Catholic, their chief glory is that conveyed in the name of the Holy Orthodox Church. In the West, meanwhile, the growth of the power of the papacy had tended more and more to the interpretation of the word "catholic" as implying communion with, and obedience to, the See of Rome (see PAPIACY); the churches of the East, no less than the heretical and schismatic in the West, by repudiating this allegiance, had ceased to be Catholic. This identification of "Catholic" with "Roman" was accentuated by the progress of the Reformation. The Reformers themselves, indeed, like other dissidents and reformers before them, did not necessarily repudiate the name of Catholic; they believed, in fact, in catholicism, i.e. the universal sanction of their beliefs, as firmly as did the adherents of "the old religion"; they included the Catholic creeds, definitions formulated by the universal church, in their service books; they too appealed, as the fathers of Basel and Constance had done, from the papal monarchy to the great ecclesiastical republic. The Church of England at least, emphasizing her own essential catholicity, retained in her translations of the ancient symbols the word "catholic" instead of replacing it by "universal." But the appeal to the verbally inspired Bible was stronger than that to a church hopelessly divided; the Bible, and not the consent of the universal church, became the touchstone of the reformed orthodoxy; in the nomenclature of the time, "evangelical" arose in contradistinction to "Catholic," while, in popular parlance, the "protest" of the Reformers against the "corruptions of Rome" led to the invention of the term "Protestant," which, though nowhere assumed in the official titles of the older reformed churches, was early used as a generic term to include all.

"Catholic" and "Catholicism" thus again changed and narrowed their meaning; they became, by universal usage, identified definitely with "Romanist" and the creed and obedience of Rome. Even in England, where the church retained most strongly the Catholic tradition, this distinction of "Protestant" and "Catholic" was clearly maintained, at least till the "Catholic revival" in the Church of England of the 19th century. On the continent of Europe the equivalent words (e.g. Ger. Katholik, Katholizismus; Fr. catholique, catholicisme) are even more definitely associated with Rome; they have lost the sense which they still convey to a considerable school of Anglo-Americans. The expression "Roman Catholic churches" is always forced to qualify their titles; they are "Old Catholics" (Alt-Katholiken) or "German Catholics" (Deutsch-Katholiken). The Church of Rome alone, officially and in popular parlance, is "the Catholic Church" (katholische Kirche, église catholique), a title which she proudly claims as exclusively her own, by divine right, by the sanction of immemorial tradition, and by reason of her perpetual protest against the idea of "national" churches, consecrated by the Reformation (see CHURCH HISTORY, and ROMAN CATHOLIC CHURCH). The additional qualification of "Roman" she tolerates, since it proclaims her doctrine of the see of Rome as the keystone of Catholicism; but to herself she is "the Catholic Church," and her members are "Catholics." Yet to concede this claim and surrender without qualification the word "Catholic" to a connotation which is at best only universal in theory, is to beg several very weighty questions. The doctrine of the Catholic Church, i.e. the essential unity and interdependence of "all God's faithful people scattered throughout the world," is the basis to all sections of Christianity. The creed is one; it is the interpretation that differs. In a somewhat narrower sense, too, the Church of England at least has never repudiated the conception of the Catholic Church as a divinely instituted organization for the safe-guarding and proclamation of the Christian revelation. She deliberately retained the Catholic creeds, the Catholic ministry and the appeal to Catholic antiquity (see ENGLAND, CHURCH OF). A large section of her members, accordingly, laying stress on this side of her tradition, prefer to call themselves "Catholics." But, though the invention of the terms "Roman Catholic" and "Roman Catholicism" early implied the retention by the English Church of her Catholic claim, her members were never, after the Reformation, called Catholics; even the Caroline divines of the 17th century, for all their "popish practices," styled themselves Protestants, though they would have professed their adherence to "the Catholic faith and their belief in "the Holy Catholic Church." Clearly, then, the exact meaning of the term varies according to those who use it and those to whom it is applied. To the Romanist "Catholic" means "Roman Catholic"; to the high Anglican it means whatever is common to the three "historic" branches into which he conceives the church to be divided—Roman, Anglican and Orthodox; to the Protestant pure and simple it means either what it does to the Romanist, or, in expansive moments, simply what is "universal" to all Christians. In a yet broader sense it is used adjectivally of mere wideness or universality of view, as when we speak of a man as "of catholic sympathies" or "catholic in his tastes." The name of Catholic Epistles is given to those letters (two of Peter, three of John, one of James, one of Jude) incorporated in the New Testament which (except 2 and 3 John) are not, like
those of St Paul, addressed to particular individuals or churches, but to a larger and more indefinite circle of readers. (See Bible: New Testament, Canon.)

The title of Catholicos (καθολικός) seems to have been used under the Roman empire, though rarely, as the Greek equivalent of consulsaris and praefectus. Thus Eusebius (Hist. ecc. viii. 33) speaks of the catholicos of Africa (καθολικός τῆς Ἀφρικῆς). As an ecclesiastical title it was used to imply, not universal (ecumenical), but a great and widespread jurisdiction. Thus the bishop of the important see of Seleucia (Bagdad), though subordinate to the patriarch of Antioch, had the title of Catholicus and power to consecrate even archbishops; and on the division of the see there were two Catholici under the patriarch of Antioch. In Ethiopia, too, there were Catholici with less extensive powers, subject to the patriarch of Alexandria. The title now survives, however, only as that of the head of the Armenian Church (q.v.). A bishop’s cathedral church is, however, in Greek the Catholicos.

An isolated use of the word “catholic” as a secular legal term survives in Scots law; a catholic creditor is one whose debt is secured over several or over all of the subjects belonging to the debtor.

CATHOLIC APOSTOLIC CHURCH, THE, a religious community often called “Irvingites,” though neither actually founded nor anticipated by Edward Irving (q.v.). Irving’s relation to this community was, according to its members, somewhat similar to that of John the Baptist to the early Christian Church, i.e. he was the forerunner and prophet of the coming dispensation, not the founder of a new sect; and indeed the only connexion which Irving seems to have had with the existing organization of the Catholic Apostolic body was in “fostering spiritual persons who had been driven out of other congregations for the exercise of their spiritual gifts.” Shortly after Irving’s trial and deposition (1831), certain persons were, at some meetings held for prayer, designated as “called to be apostles of the Lord” by certain others claiming prophetic gifts. In the year 1835, six months after Irving’s death, six others were similarly designated as “called” to complete the number of the “twelve,” who were then formally “separated” by the pastors of the local congregations to which they belonged, to their higher office in the universal church on the 14th of July 1835. This separation is understood by the community not as “in any sense being a schism or separation from the one Catholic Church, but a separation to a special work of blessing and intercession on behalf of it.” The twelve were afterwards guided to ordain others—twelve prophets, twelve evangelists, and twelve pastors, “sharing equally with them the one Catholic Episcopate,” and also seven deacons for administering the temporal affairs of the church catholic. The apostles were the channels of the Holy Ghost and the mysteries of God, and the authoritative interpreters of “prophetic utterance”; their teaching was brought home to the people by the “evangelists.” The function of the prophets was to explain scripture and exhort to holiness, that of the “pastors” is explained by their title. The central episcopacy of forty-eight was regarded as “indicated by prophecy,” being foreshadowed in the forty-eight boards of the Mosaic tabernacle. For ecclesiastical purposes this church underwrote their charge in twelve tribes; for Christendom is considered to be divided into twelve portions or tribes, each tribe being under the special charge of an apostle and his co-ministers, and the seat of the Apostolic College being at Albury, near Guildford. This is an ideal outline which has never been fulfilled. There has never been a “central episcopacy” of forty-eight. The “apostles” alone always held the supreme authority, though, as their number dwindled, “coadjutors” were appointed to assist the survivors, and to exercise the functions of the “apostolate.” The last “apostle” died on the 3rd of February 1901.

For the service of the church a comprehensive book of liturgies and offices was provided by the “apostles.” It dates from 1842 and is based on the Anglican, Roman and Greek liturgies. Lights, incense, vestments, holy water, chalice, and other adjuncts of worship are in constant use. The ceremonial in its completeness may be seen in the church in Gordon Square, London, and elsewhere. The daily worship consists of “matins” with “prophecy” (or exposition) of the sacrament at 6 a.m., prayers at 9 a.m. and 3 p.m., and “vespers” with “prophecy” at 5 p.m. On all Sundays and holy days there is a “solemn celebration of the eucharist” at the high altar; on Sundays this is at 10 a.m. On other days “low celebrations” are held in the side-chapels, which with the chancel in all churches correctly built after apostolic directions are separated or marked off from the nave by open screens with gates. The community has always lared great stress on symbolism, and in the eucharist, while rejecting both transubstantiation and consubstantiation, holds strongly to a real (mystical) presence. It emphasizes also the “phomena” of Christian experience and deems miracle and mystery to be of the essence of a spirit-filled church.

Each congregation is presided over by its “angel” or bishop (who ranks as angel-pastor in the Universal Church); under him are four-and-twenty priests, divided into the four ministries of elders, prophets, evangelists and pastors,” and with these are the ministers, seven of whom regulate the temporal affairs of the church—besides whom there are also “suli-deacons, acolytes, singers, and door-keepers.” The understanding is that each elder, with his co-presbyters and deacons, shall have charge of 500 adult communicants in his district; but this has been but partially carried into practice. This is the full constitution of each particular church or congregation as founded by the “restored apostles,” each local church thus “reflecting in its government the government of the church catholic by the angel or high priest Jesus Christ, and His forty-eight presbyters in their fourfold ministry (in which apostles and elders always rank first), and under these the deacons of the church catholic.” The priesthood is supported by tithes; it being deemed a duty on the part of all members of the church who receive yearly incomes to offer a tithe of their increase every week, besides the free-will offering for the support of the place of worship, and for the relief of distress. Each local church sends a “tithes” to the “Temple,” by which the ministers of the Universal Church are supported and its administrative expenses defrayed; by these offerings, too, the needs of poorer churches are supplied. It claims to have among its clergy many of the Roman, Anglican and other churches, the orders of those ordained by Greek, Roman and Anglican bishops being recognized by it with the simple confirmation of an “apostolic act.” The community has not changed recently in general constitution or doctrine. It does not publish statistics, and its growth during late years is said to have been more marked in the United States and in certain European countries, such as Germany, than in Great Britain. There are nine congregations enumerated in The Religious Life of London (1904).

CATILINE [LUCIUS SERGIIUS CATILLINA] (c. 108-52 B.C.), a member of an ancient but impoverished patrician family of Rome, the prime mover in the conspiracy known by his name. He appears in history first as a supporter of Sulla, and during the proscription he was conspicuous for his greed and cruelty. He slew his inoffensive brother-in-law with his own hand, and tortured and mutilated the much-loved Marius Gratidianus. He was believed to have made away with his wife and his son to win the profligate and wealthy Aurelia Orestilla; it was even suspected that he had been guilty of an intrigue with the Vestal Fidia. In 77 he was quaseator, in 68 praetor, and in 67-66 governor of Africa. His extortions and subsequent impeachment by P. Clodius Pulcher having disqualified him as a candidate for the consulship, he formed a conspiracy, in which he was joined by young men of all classes, even Crassus and Caesar, according to rumour, being implicated. The new consuls were to be murdered on the 1st of January; but the plot—the
execution of which was deferred till the 6th of February—failed in consequence of the impatience of Catiline, who gave the signal to start, and who was himself an instigator. Some of the inciters, judges and accusers, was acquitted in the trial for extortion. His scheme was forthwith immensely widened. The city was to be fired, and those who opposed the revolution were to be slain; all debts were to be cancelled; and there was to be a proscription of all the wealthy citizens. Among the conspirators were many men of the first rank and influence. Arms and money were collected, soldiers were enlisted, and the assistance of the slaves was sought. But Catiline's hopes were again disappointed; once more he failed to obtain the consulship (64); and, moreover, it soon became apparent that one of the new consuls, Cicero, was mysteriously able to thwart all the schemes of the conspirators. He was, in fact, informed of every detail, through Fulvia, the mistress of Curius, one of the plotters, who was himself soon persuaded to turn informer. The other consul, C. Antonius, in whom Catiline hoped to find a supporter, was won over and got out of the way by Cicero, who resigned the province of Macedonia in his favour. Before the next comitia consularia assembled, the orator had given so impressive a warning of the danger which was impending, that Catiline was once more rejected (63), and the consuls were invested with absolute authority. Cicero, having now restored upon open war; preparations were set on throughout Italy, especially in Etruria, where the standard of revolt was raised by the centurion C. Manlius (or Mallius), one of Sulla's veterans. A plan to murder Cicero in his own house on the morning of the 7th of November was frustrated. On the next day Cicero attacked Catiline so vigorously in the senate (in his first Catillanian oration) that he fled to his army in Etruria. Next day Cicero awoke the terror of the people by a second oration delivered in the forum, in consequence of which Catiline and Manlius were declared public enemies, and the consul Antonius was despatched with an army against them. Meanwhile the imprudence of the conspirators in Rome brought about their own destruction. Some deputies from the Allobroges, who had been sent to Rome to obtain redress for certain grievances, were approached by P. Lentulus Sura, the chief of the conspirators, who endeavoured to induce them to join him. After considerable hesitation, the deputies decided to turn informers. The plot was betrayed to Cicero, at whose instigation documentary evidence was obtained, implicating Lentulus and others. The conspirators were arrested, and a grand jury, which sat by Dio Cassius on the 4th of December condemned to death and strangled in the underground dungeon on the slope of the Capitol. This act, which was opposed by Julius Caesar and advocated by Catulus Uticensis (and, indirectly, by Cicero), was afterwards vigorously attacked as a violation of the constitution, on the ground that the senate had no power of life and death over a Roman citizen. Thus a heavy blow was dealt to the cause of Catiline, who, in the beginning of 62, saw his legions, only partially armed and diminished by desertion, shut in between those of Metellus Celer and C. Antonius. Near Pistoria he hazarded battle with the forces of the latter, but was completely defeated in a desperate encounter. He himself, fighting with the utmost bravery, rushed into the ranks of the enemy and met his death.

Such was the conspiracy of Catiline and the character of its author, as we find them in the speeches of Cicero, and the histories of Sallust and Dio Cassius (see also Plutarch, Cicero; Vell. Pat. ii. 35; Florus iv. 1; Appian, B.C. ii. 6; Eutropius vi. 15). It must not be forgotten, however, that our authorities were all members of the aristocratic party. Yet Cicero, as a Stoic, was manifestly absurdist; and Cicero paid more regard to the effect than to the truthfulness of an accusation. We find him at one time admitting that Catiline had almost persuaded him of his honesty and merit, and even seeking a political union with him; at another, when his alliance had been rejected and an election was at hand, declaring against him as a murderer and a profligate. Lastly, though Sallust's vivid narrative is consistent throughout, it is obvious that he cherished very bitter feelings against the democratic party. Nevertheless, we cannot regard Catiline as an honest enemy of the oligarchy, or as a disinterested champion of the provincials. It is held by some historians that there was at the time no part of the Roman nobles a determination to raise themselves to power, despite the opposition of the senate; others with greater probability maintain that Catiline's object was simply the cancelling of the huge debts which he and his friends had accumulated. Catiline, by his bravery, his military talents, his vigorous resolution, and his wonderful power over men, was eminently qualified as a revolutionary leader. He is the subject of tragedies by Ben Jonson and F. Crébillon, and of the Rome savale de Voltaire.

ROME: History, The Republic.

CATINAT, NICOLAS (1637-1712), marshal of France, entered the Gardes Françaises at an early age and distinguished himself at the siege of Lille in 1667. He became a brigadier ten years later, maréchal de camp in 1680, and lieutenant-general 1688. He served with great credit in the campaigns of 1676-1678 in Flanders, was employed against the Vaudois in 1686, and after taking part in the siege of Philippsburg at the opening of the War of the League of Augsburg, he was appointed to command the French troops in the south-eastern theatre of war. In 1690 he conquered Savoy, and in 1691 Nice; the battle of Staffarda, won by him over the duke of Savoy in 1690, and that of Marsaglia in 1693, were amongst the greatest victories of the time. In 1698 he made the Hapsburgs, one of the terms of the peace of Ryswick, accept the duchy of Parma, which was confirmed by the Treaty of Utrecht (1713). He had in 1693 been made a marshal of France. At the beginning of the war of the Spanish Succession, Catinat was placed in charge of operations in Italy, but he was much hampered by the orders of the French court and the weakness of the forces for their task. He suffered a reverse at Carpi (1701) and was soon afterwards superseded by Villeroi, to whom he acted as second-in-command during the campaign of Chiari. He died at St Gratien in 1712. His memoirs were published in 1819.

See E. de Broglie, Catinat, 1637-1712 (Paris, 1902).

CATILIN, GEORGE (1706-1872), American ethnologist, was born at Wilkes-Barre, Pennsylvania, in 1706. He was educated as a lawyer and practised in Philadelphia for two years; but art was his favourite pursuit, and forsaking the law he established himself at New York as a portrait painter. In 1832, realizing that the American Indians were dying out, he resolved to rescue their types and customs from oblivion. With this object he spent many years among the Indians in North and South America. He lived with them, acquired their languages, and studied very thoroughly their habits, customs and mode of life, making copious notes and many studies for paintings. In 1840 he came to Europe with his collection of paintings, most of which are now in the National Museum, Washington, as the Catlin Gallery; and in the following year he published the Manners, Customs, and Signs of the North American Indians in two volumes, illustrated with 390 engravings. This was followed in 1844 by The North American Portfolio, containing 25 plates of hunting scenes and amusements in the Rocky Mountains and the prairies of America, and in 1848 by Eight Years' Travels and Residence in Europe. In 1861 he published a curious little volume, in "manuscript," entitled The Breath of Life, on the advantage of keeping one's mouth habitually closed, especially during sleep; and in 1868, Last Rambles amongst the Indians of the Rocky Mountains and the Andes. He died in Jersey City, New Jersey, on the 22nd of December 1872.
Cato, Dionysius, the supposed author of the Dionyssii Catonis Disticha de Moribus ad Filium. The name usually given is simply Cato, an indication of the wise character of the maxims, but Dionysius is added on the authority of a MS., declared by Scaliger to be of great antiquity. This MS. also contains Priscian's translation of the Periēgesis of the geographer Dionysius Periegetes; this has probably led to the Disticha also being attributed to him. In the middle ages the author on the Disticha was supposed to be Cato the Elder, who wrote a Carmen de Moribus, but extracts from this in Aulus Gellius show that it was in prose. Nothing is really known of the author or date of the Disticha; it can only be assigned to the 3rd or 4th century A.D. It is a small collection of moral aphorisms, each consisting of two hexameters, in four books. They are monothestic in character, not specially Christian. The dictum and metre are fairly good. The book had a great reputation in the middle ages, and was translated into many languages; it is frequently referred to by Chaucer, and in 1483 a translation was issued from Caxton's press at Westminster.

Editions by F. Haithau (1890), with full account of MSS. and early editions, and G. Nennethy (1895), with critical notes; see also F. Zarncke, Der deutsche Cato (1852), a history of middle age German translations; J. Nehab, Der alldeutsche Cato (1879); E. Bischoff, Predigten zum sogennannten Dionysius Cato (1893), in which the name was changed to Catonis Priscianus; for a criticism of the various translations and editions see Teuffel, Hist. of Roman Lit., § 398-3.

Cato, Marcus Porcius (234-149 B.C.), Roman statesman, surnamed "The Censor," Sapientis, Priscus, or Major (the Elder), to distinguish him from Cato of Utica, was born at Tusculum. He came of an ancient plebeian family, noted for some military services, but not ennobled by the discharge of the higher civil offices. He was bred, after the manner of his Latin forefathers, to agriculture, to which he devoted himself when not engaged in military service. But, having attracted the notice of L. Valerius Flaccus, he was brought to Rome, and became successively quaestor (264), aedile (199), praetor (198), and consul (195) with his old patron. During his term of office he vainly opposed the repeal of the lex Oppia, passed during the Second Punic War to restrict luxury and extravagance on the part of women. Meanwhile he served in Africa, and took part in the crowning campaign of Zama (202). He held a command in Sardinia, where he first showed his strict public morality, and again in Spain, which he reduced to subjection with great cruelty, and gained thereby the honour of a triumph (194). In the year 191 he acted as master of the horse under the command of Silus Flaccus, and played an important part in the battle of Thermopylae, which finally delivered Greece from the encroachments of the East. His reputation as a soldier was now established; henceforth he preferred to serve the state at home, scrutinizing the conduct of the candidates for public honours and of generals in the field. If he was not personally engaged in the prosecution of the Scipios (Africanus and Asianticus) for corruption, it was his spirit that animated the attack upon them. Even Africanus, who refused to apply to the charge, saying only, "Romans, this is the day on which I conquered Hannibal," and was absolved by acclamation, found it necessary to retire self-banished to his villa at Liternum. Cato's enmity dated from the African campaign when he quarrelled with Scipio for his lavish distribution of the spoil amongst the troops, and his general luxury and extravagance.

Cato had, however, a more serious task to perform in opposing the spread of the new Hellenic culture which threatened to destroy the rugged simplicity of the conventional Roman type. He conceived it to be his special mission to resist this invasion. It was in the discharge of the censorship that this determination was most strongly exhibited, and hence that he derived the title (the Censor) by which he is most generally distinguished. He revised with unsparing severity the lists of senators and knights, ejecting from either order the men whom he judged unworthy of it, either on moral grounds or from their want of the prescribed means. The expulsion of L. Quinctius Flamininus for wanton cruelty was an example of his rigid justice. His regulations against luxury were very stringent. He imposed a heavy tax upon dress and personal adornment, especially of women, and upon young slaves purchased as favourites. In 181 he supported the lex Orichla (according to others, he first opposed its introduction, and subsequently its repeal), which prescribed a limit to the number of guests at an entertainment, and in 169 the lex Voconia, one of the provisions of which was intended to check the accumulation of an undue proportion of wealth in the hands of women. Amongst other things he repaired the aqueducts, cleaned the sewers, prevented private persons drawing off public water for their own use, ordered the demolition of houses which encroached on the public way, and built the first basilica in the forum near the curia. He raised the amount paid by the publican for the right of farming the taxes, and at the same time diminished the contract prices for the construction of public works.

From the date of his censorship (184) to his death in 149, Cato held no public office, but continued to distinguish himself in the senate as the persistent opponent of the new ideas. He was struck with horror, along with many other Romans of the graver stamp, at the licence of the Bacchanalian mysteries, which he attributed to the fatal influence of Greek manners; and he vehemently urged the dismissal of the philosophers (Carneades, Diogenes and Critolaus), who came as ambassadors from Athens, on account of the dangerous nature of the views expressed by them. He had a horror of physicians, who were chiefly Greeks. He pronounced the release of Polybius, the historian and his fellow-citizens, contemptuously asking whether the senate had nothing more important to do than discuss whether a few Greeks should die at Rome or in their own land. It was not till his eightieth year that he made his first acquaintance with Greek literature. Almost his last public act was to urge his countrymen to the Third Punic War and the destruction of Carthage. In 157 he was one of the deputies sent to Carthage to arbitrate between the Carthaginians and Massinissa, king of Numidia. The mission was unsuccessful and the commissioners returned home. But Cato was so struck by the evidences of Carthaginian prosperity that he was convinced that the security of Rome depended on the annihilation of Carthage. From this time, in season and out of season, he kept repeating the cry: "Delenda est Carthago." To Cato the individual life was a continual discipline, and public life was the discipline of the many. He regarded the individual householder as the germ of the family, the family as the germ of the state. By strict economy of time he accomplished an immense amount of work; he exacted similar application from his dependents, and proved himself a severe husband and a severe father. There was little difference apparently, in the esteem in which he held his wife and his slaves; his pride alone induced him to take a warmer interest in his sons. To the Romans themselves there was little in this behaviour which seemed worthy of censure; it was respected rather as a traditional example of the old Roman manners. In the remarkable passage (xxxix. 40) in which Livy describes the character of Cato, there is no word of blame for the rigid discipline of his household.

Cato perhaps deserves even more notice as a literary man than as a statesman or a soldier. He was the first Latin prose writer of any importance, and the first author of a history of Rome in Latin. His treatise on agriculture (De Agricultura or De Re Rustica) is the only work by him that has been preserved; it is not agreed whether the work we possess is the original or a later revision. It contains a miscellaneous collection of rules of good husbandry, conveying much curious information on the domestic habits of the Romans of his age. His most important work, Origines, in seven books, related the history of Rome from its earliest foundations to his own day. It was so called from the second and third books, which described the rise of the great Italian towns. His speeches, of which as many as 130 were collected, were principally directed against the young free-thinking and loose-principled nobles of the day. He also wrote a set of maxims for the use of his son (Præcepta ad Filium), and some rules for everyday life in verse (Carmen de Moribus). The collection of proverbs in hexameter verse,
extant under the name of Cato, probably belongs to the 4th century a.d. (See Cato, Dionysius.)

AUTHORITIES.—There are lives of Cato by Cornelius Nepos, Plutarch and Aurelius Victor, and many particulars of his career and character are to be gathered from Livy and Cicero. See also F. D. Gerlach, Marcus Porcius Cato der Censor (Basel, 1869); G. Kurth, Cato (A.Bacch., 1872); J. Cortese, De M. Porcius Catonis vita, opera et lingua (Turin, 1883); F. Marcucci, Studio critico della vita e delle opere di Catone il Maggiore (1903). The best edition of the De Agricultura is by H. Keil (1884-1891), of the fragments of the Origines by H. Peter (1883) in Historicon Romarum Fragmenta, of the fragments generally by H. Jordan (1860); see also J. Wendt, ed., Fragments and Specimens of Early Latin (1887); M. Schanz, Geschichte der römischen Litteratur (1898): article in Smith's Dictionary of Greek and Roman Biography; Mommsen, Hist of Rome (Eng. trans.), bk. iii. ch. xi and xiv: Warde Fowler, Social Life at Rome (1909).

CATO, MARCUS PORCIUS (35-46 B.C.), Roman philosopher, called Ulicensis to distinguish him from his great-grandfather, the "Censor." On the death of his parents he was brought up in the house of his uncle, M. Livius Drusus. After fighting with distinction in the ranks against Spartacus (7 B.C.), he became a military tribune (67), and served a campaign in Macedon, but he never had any enthusiasm for the military profession. On his return to Rome, and showed so much zeal and integrity in the management of the public accounts that he obtained a provincial appointment in Asia, where he strengthened his reputation. Though filled with disgust at the corruption of the public men with whom he came in contact, he saw much to admire in the discipline which Lucullus had enforced in his own eastern command, and he supported his claims to a triumph, while he opposed the inordinate pretensions of Pompey. When the favour of the nobles gained him the tribunate, he exerted himself unsuccessfully to convict L. Licinius Murena (2), one of their chief men, of bribery. Cicero, who defended Murena, was glad to have Cato's aid when he urged the execution of the Catilinarian conspirators. Cato's vote on this matter drew upon him the bitter resentment of Julius Caesar, who did his utmost to save them.

Cato had now become a great power in the state. Though possessed of little wealth and no family influence, his unflinching resolution in the cause of the ancient free state rendered him a valuable instrument in the hands of the nobles. He vainly opposed Caesar's candidate for the consulship in 59, and his attempt, in conjunction with Bibulus, to prevent the sitting of the Sikh in the Senate and the passing of a property law for distributing land amongst the Asiatic veterans, proved unsuccessful. Nevertheless, although his efforts were ineffectual, he was still an obstacle of sufficient importance for the triumvirs to desire to get rid of him. At the instigation of Caesar he was sent to Cyprus (48) with a mission to depose its king, Ptolemy (brother of Ptolemy Auletes), and annex the island. On his return two years later he continued to struggle against the combined powers of the triumvirs in the city, and became involved in scenes of violence and riot. He succeeded in obtaining the praetorship in 54, and strenuously exerted himself in the hopeless and thankless task of suppressing bribery, in which all parties were equally interested. He failed to attain the consulship, and had made up his mind to retire from the arena of civic ambition when the civil war broke out in 49. Feeling that the sole chance for the free state lay in concealing an actual supremacy to Pompey, whom he had formerly vigorously opposed, he did not scruple to support the unjust measures of the nobles against Caesar. At the outset of the war he was entrusted with the defence of Sicily, but finding it impossible to resist the superior forces of C. Scribonius Curio, who had landed on the island, he joined Pompey at Myra. When his chief followed Caesar to Thessaly he was left behind in charge of the camp, and thus was not present at the battle of Pharsalus.

After the battle, when Pompey abandoned his party, he separated himself from the main body of the republicans, and conducted a small remnant of their forces into Africa. After his famous march through the Libyan deserts, he shut himself up in Utica, and even after the decisive defeat at Thapsus (46), in spite of the wishes of his followers, he determined to keep the gates closed till he had sent off his adherents by sea. While the embarkation was in progress he suddenly called a council, at which the last of the transports had left the port, he cheerfully dismissed his attendants, and soon afterwards stabbed himself.

He had been reading, we are told, in his last moments Plato's dialogue on the immortality of the soul, but his own philosophy had taught him to act upon a narrow sense of immediate duty without regard to the future. He conceived that he was placed in the world to play an active part, and when disabled from carrying out his principles, to retire gravely from it. He had lived for the free state, and it now seemed his duty to perish with it. In politics he was a typical doctrinaire, abhorring compromise and obstinately blind to the fact that his national ideal was a hopeless anachronism. From the circumstances of his life and of his death, he has come to be regarded as one of the most distinguished of Roman philosophers, but he composed no works, and bequeathed to posterity no other instruction than that of his example. The only composition by him which we possess is a letter to Cicero (Ad Fam. xv. 3), a polite refusal of the orator's request that he would endeavour to procure him the honour of a triumph. The school of the Stoics, which took a leading part in the history of Rome under the earlier emperors, looked to him as its saint and patron. It continued to wage war with Cicero, hardly less openly. Cato himself, however, had done for two centuries, till at last it became actually seated on the imperial throne in the person of Marcus Aurelius. Immediately after his death Cato's character became the subject of discussion; Cicero's panegyric Cato was answered by Caesar in his Anticato. Brutus, dissatisfied with Cicero's work, produced another on the same subject; in Lucan Cato is represented as a model of virtue and disinterestedness.

See Life by Plutarch, and compare Addison's tragedy. Modern biographies by H. Wartmann (Zürich, 1859), and F. D. Gerlach (Basel, 1860); C. W. Oman, Seven Roman Statesmen of the Later Republic, Cato, 1 (1902); Mommsen, Hist of Rome (Eng. trans.), bk. v. ch. v.; article in Smith's Dictionary of Classical Biography; Gaston Boissier, Cicero and his Friends (Eng. trans., 1897), esp. pp. 277 foll.: Warde Fowler, Social Life at Rome (1909).

CATO, PUBLIUS VALERIUS, Roman poet and grammarian, was born about 100 B.C. He is of importance as the leader of the "new" school of poetry (poetae novi, veloperos, as Cicero calls them). Its followers rejected the national epic and drama in favour of the artificial mythological elegies and eclogues of the Alexandrian school, and preferred Euphorion of Chalcis to Ennius. Learning, that is, a knowledge of Greek literature and myths, and strict adherence tometrical rules were regarded by them. Their representatives were known as "veloperos." The veloperos were also determined opponents of Pompey and Caesar. The great influence of Cato is attested by the lines:—

"Cato grammaticus, Latina Sire, Qui solus legit ac facit poetas."

Our information regarding his life is derived from Suetonius (De Grammaticis, 11). He was a native of Caisiping Gau, and lost his property during the Sullan disturbances before he had attained his majority. He lived to a great age, and during the latter part of his life was in very reduced circumstances. He was at one time possessed of considerable wealth, and owned a villa at Tusculum which he was obliged to hand over to his creditors. In addition to grammatical treatises, Cato wrote a number of poems, the best-known of which were the Lydia and Diana. In the Indignatio (perhaps a short poem) he defended himself against the accusation that he was of servile birth. It is probable that he is the Cato mentioned as a critic of Lucullus in the lines by an unknown author prefixed to Horace, Satires, 1. 10.

Among the minor poems attributed to Virgil is one called Dirae (or rather Dirae). It consists of imprecations against the estate of which the writer has been deprived, and where he is obliged to leave his beloved Lydia; in the Lydia, on the other hand, the estate is regarded with envy as the possessor of his charmer. Joseph Justus Scaliger was the first to attribute the poem (divided into two by F. Jacobi) to Valerius Cato, on the ground

1 **"Cato, the grammarian, the Latin siren, who alone reads aloud the works and makes the repetition of poets."**
CATS—CATTANO

that he had lost an estate and had written a Lydiz. The question has been much discussed; the balance of opinion is in favour of the Dirce being assigned to the beginning of the Augustan age, although so distinguished a critic as O. Ribbeck supports the claims of Catu to the authorship. The best edition of these works is J. A. E. Naeke (1847), with exhaustive commentary and excursuses; a clear account of the question will be found in M. Schanz's Geschichte der römischen Literatur; for the new "school" of poetry see Moormann, Hist. of Rome, bk. v. ch. xii.; F. Piessis, Poésie latine (1909), 188.

CATS, JACOB (1577-1660), Dutch poet and humorist, was born at Brouwershaven in Zealand on the 10th of November 1577. Having lost his mother at an early age, and being adopted with his three brothers by an uncle, Cats was sent to school at Zierikzee. He then studied law at Leiden and at Oxford. Returning to Holland, he was settled at the Hague, where he began to practise as an advocate. His pleading in defence of a wretched creature accused of witchcraft brought him many clients and some reputation. He had a serious love affair about this time, which was broken off on the very eve of marriage by his catching a tertian fever which defied all attempts at cure for some two years. For medical advice and change of air Cats went to England, where he consulted the highest authorities in vain. He returned to Zealand to die, but was cured mysteriously by a startling quack. He married in 1602 a lady of some property, Elisabeth von Valkenburg, and thenceforward lived at Grypskerke in Zealand, where he devoted himself to farming and poetry. His best works are: Emblemata or Miniaturen with Maegdenplicht (1618); Spiegel van den ouden en nieuwen Tijt (1622); Houtvelders ... (1623); Selfrijt (1620); Uoderin, Buitem leven ... en Hofgedaichten op Sorgviel (1664); and Gedachten op slapeloze nachten (1661). In 1621, on the expiration of the twelve years' truce with Spain, the breaking of the dykes drove him from his farm. He was made pensionary (stipendiary magistrate) of middelburg; and two years afterwards of Dort. In 1627 Cats came to England on a mission to Charles I., who made him pensionary of East Anglia and governor of Harwich. He was made grand pensionary of Holland, and in 1648 keeper of the great seal of that country. He resigned his offices, but in 1657 he was sent a second time to England on what proved to be an unsuccessful mission to Cromwell. In the seclusion of his villa of Sorgviel (Fly-from-Care), near the Hague, he lived from this time till his death, occupied in the composition of his autobiography (Eighty-two Years of My Life, first printed at Leiden in 1734) and of his poems. He died on the 12th of September 1660, and was buried by torchlight, and with great ceremony, in the Klooster-Kerk at the Hague. He is still spoken of as "Father Cats" by his countrymen.

Cats was contemporary with Hofst and Vondel and other distinguished Dutch writers in the golden age of Dutch literature, but his Orangist and Calvinistic opinions separated him from the liberal school of Amsterdam poets. He was, however, intimate with Constantin Huygens, whose political opinions were more nearly in agreement with his own. For an estimate of his poetry see Dutch Literature. Hardly known outside of Holland, among his own people for nearly two centuries he enjoyed an enormous popularity. His diffuseness and the antiquated character of his matter and diction, have, however, to come to be regarded as difficulties in the way of study, and he is more renowned throughout than read. A statue to him was erected at Brouwershaven in 1829.

See Jacob Cats, Complete Works (1790-1800, 19 vols.), later editions by van Vloten (Zwolle, 1858-1866); and at Schiedam, 1869-1870); Pigott, Moral Emblems, with Aphorisms, &c., from Jacob Cats (1860); and P. C. Wiltse Geijzels, Het Leven en de Werkzaamheden van Jacob Cats (1889). Southern shows a very complimentary reference to Cats in his "Epistle to Allan Cunningham."

Cats' Eye, a name given to several distinct minerals, their common characteristic being that when cut with a convex surface they display a luminous band, like that seen by reflection in the eye of a cat. (1) Precious cat's-eye, oriental cat's-eye or chrysoberyl cat's-eye. This, the rarest of all, is a chatoyant variety of chrysoberyl (\(\text{H}3\text{SiO}_4\)), showing in the finest stones a very sharply defined line of light. One of the grandest known specimens was in the Hope collection of precious stones, exhibited for many years at the Victoria and Albert Museum. (2) Quartz cat's-eye. This is the common form of cat's-eye, in which the effect is due to the inclusion of parallel fibres of asbestos. Like the chrysoberyl, it is obtained chiefly from Ceylon, but though coming from the East Indies it is often called "cat's-eye" (\(\text{H}3\text{SiO}_4\)) a term intended simply to distinguish it from the oriental "oriental" stone. It is readily distinguished by its inferior density, its specific gravity being only 2.65, whilst that of oriental cat's-eye is as high as 3.7. A greenish fibrous quartz, cut as cat's-eye, occurs at Hof and some other localities in Bavaria. (3) Crocidolite cat's-eye, a beautiful golden brown mineral, with silky fibres, found in Griqualand West, and much used in recent years as an ornamental stone, sometimes under the name of "South African cat's-eye." It consists of fibrous quartz, coloured with oxide of iron, and results from the alteration of crocidolite (\(\text{H}_4\text{SiO}_{2}\)). It is often distinguished as "tiger's-eye" (or more commonly "tiger-eye"), whilst a blue variety, less altered, is known as "hawk's-eye." By the action of hydrochloric acid the colour of tiger's-eye may to a large extent be removed, and a greyish cat's-eye obtained. (4) Corundum cat's-eye. In some asteriated corundum (see Asteria) the star is imperfect and may be reduced to a luminous zone, producing an indistinct cat's-eye effect. According to the colour of the corundum the stone is known as sapphire cat's-eye, ruby cat's-eye, topaz cat's-eye, &c. (F. W. R.)

Catskill, a village and the county-seat of Greene county, New York, U.S.A., on the W. bank of the Hudson river, 33 m. S. of Albany. Pop. (1850) 4920; (1890) 5484; of whom 657 are foreigners (1880). It is served by the West Shore railway, by several lines of river steamboats, and by the Catskill Mountain railway, connecting it with the popular summer resorts in the Catskill mountains. A ferry connects with Catskill station (Greendale) on the east side of the Hudson. The village is in a farming country, and manufactures woollen goods and bricks, but it is best known as a summer resort, and as the principal gateway to the beautiful Catskill Mountain region. The Recorder, a weekly newspaper, was established here in 1792 as the Packet. The first settler on the present site of Catskill was Derrick Tenus van Vechten, who built a house here in 1680.

The village was not incorporated until 1806.

See J. D. Pinkney, Reminiscences of Catskill (Catskill, 1868).

Catskill (formerly Kaatskill) Mountains, a group of moderate elevation pertaining to the Appalachian plateau, and not properly included in the Appalachian system of North America because they lack the internal structures and the general parallelism of topographic features which characterize the Appalachian ranges. The group contains many summits above 3000 ft. elevation and half a dozen approaching 4000, Slide Mountain (4205 ft.), and Hunter Mountain (4057 ft.), being the only ones exceeding that figure. The bottom lands along the creeks which drain the mountains, together with rolling uplands rising to elevations of from 1500 to 2000 ft., are under cultivation, the mountain slopes being forested or devoted to grazing. The pure and cool atmosphere attracts summer visitors, for whose accommodation many hotels have been built, some of which have become celebrated.

Stoney Clove and Kaaterskill Clove are picturesque gorges, the former being traversed by a railway, and the latter containing three cascades having a total fall of about 300 ft. The growing need of New York City for an increased water-supply has driven his engineers to the Catskills, where several great reservoirs have been projected to supplement those of the Croton watershed.

Cattaneo, CARLO (1801-1860), Italian philosopher and patriot. A republican in his convictions, during his youth he had taken part in the Carbonari movement in Lombardy. He devoted himself to the study of philosophy, hoping to regenerate the Italian people by withdrawing them from romanticism and rhetoric, and turning their attention to the positive sciences. He expounded his ideas in a review founded by him at Milan in 1837, called Il Politecnico. But when the revolution of 1848 broke out he threw himself heart and soul into the fray, and became one of the leading spirits of the insurrection against the Austrians, known as the Five Days of Milan (March 15-22, 1848). Together with Terzaghi, Cernuschi and Clerici he formed a
CATTARO—CATTERMOLE

Council of war which, having its headquarters at Casa Taverna, directed the operations of the insurgents. He was second to none in self-sacrificing energy and heroic resolution. When on the 18th of March Field Marshal Radetzky, feeling that the position of the Austrianarrison was untenable, sounded the rebels as to their terms, some of the leaders were inclined to agree to an armistice which would give time for the Piedmontese troops to arrive (Piedmont had just declared war), but Cattaneo insisted on the complete evacuation of Lombardy. Again on the 21st, Radetzky tried to obtain an armistice, and Durini and Borrowe were ready to grant it, for it would have enabled them to reorganize the defences and replenish the supplies of food and ammunition, which could only last another day. But Cattaneo replied: "The enemy having furnished us with munitions thus far, will continue to furnish them. Twenty-four hours of victuals and twenty-four hours of hunger will be many more hours than we shall need. This evening, if the plans we have just arranged should succeed, the line of the bastions will be broken. At any rate, even though we should lack bread, it is better to die of hunger than on the gallows." On the expulsion of the Austrians the question arose as to the future government of Milan and Italy. Cattaneo was an uncompromising republican and a federalist; so violent was his dislike of the Piedmontese monarchy that when his chief Charles Albert was preparing to defend the country against the Austrians, and that Radetzky was marching back to reoccupy Milan, he exclaimed: "Good news, the Piedmontese have been beaten. Now shall we be our own masters; we shall fight a people's war, we shall chase the Austrians out of Italy, and set up a Federal Republic." When the Austrians returned Cattaneo had to flee, and took refuge at Lugano, where he gave lessons, wrote his Storia della Rivoluzione del 1848, the Archivio triennale delle cose d'Italia (3 vols., 1850–1853), and then early in 1850 he started the Politecnico once more. He bitterly attacked Cavour for his unitarian views, and for the cession of Nice and Savoy. In 1860 Garibaldi summoned him to Naples to take part in the government of the Neapolitan provinces, but he would not agree to the union with Piedmont without local autonomy. After the union of Italy he was frequently asked to stand for parliament, but always refused because he could not conscientiously take the oath of allegiance to the monarchy. In 1868 the pressure of friends overcame his resistance, and he agreed to stand, but at the last moment he drew back, still unable to take the oath, and returned to Lvovo. Cattaneo was a self-sacrificing and brilliant, but far too bitter a partisan to be judicious, owing to his narrowly republican views; his ideas on local autonomy were perhaps wise, but, at a moment when unity was the first essential, inopportune.

CATTARO (Serbo-Croatian Kotor), the chief town of an administrative district in Dalmatia, Austria. Pop. (1900) of town, 3021; of commune, 5418. Cattaro occupies a narrow ledge between the Montenegrin Mountains and the Bocche di Cattaro, a winding and beautiful inlet of the Adriatic Sea. This inlet expands into five broad gulfs, united by narrower channels, and forms one of the finest natural harbours in Europe. Teodo, on the outermost gulf, is a small naval port. Cattaro is strongly fortified, and about 3000 troops are stationed in its neighbourhood. On the seaward side, the defensive works include Castelnuovo (Erceg Novi), which guards the main entrance to the Bocche. On the landward side, the long walls running from the town to the castle of San Giovanni, far above, form a striking feature in the landscape; and the heights of the Krivoscie or Crvenosica (Krivisije), a group of barren mountains between Montenegro, Herzegovina and the sea, are crowned by small forts. Cattaro is divided almost equally between the Roman Catholic and Orthodox creeds. It is the seat of a Roman Catholic bishop, with a small cathedral, a collegiate church and several convents.

The transit trade with Montenegro is impeded by high tariffs on both sides of the frontier. Foreign visitors to Montenegro usually land at Cattaro, which is connected by steamer with Triste and by road with Cattigna. The railway from Ragusa terminates at Zelenika, near Castelnuovo.

There are many interesting places on the shores of the Bocche. Castelnuovo is a picturesque town, with a dismantled 14th-century citadel, which has, at various times, been occupied by Bosnians, Turks, Venetians, Spaniards, Russians, French, English and Austrians. The orthodox convent of St. Sava, standing amid beautiful gardens, was founded in the 16th century, and contains many fine specimens of 17th-century smiths' work. There is a Benedictine monastery on a small island opposite to Perasto (Perasit), 8 m. east of Castelnuovo. Perasto itself was for a time an independent state in the 14th century. Rhizon, the modern hamlet of Risano, close by, was a thriving "Illyrian" city as early as 229 B.C., and gave its name to the Bocche, then known as Rhizonicus Sinus. Rhizon was submitted to Rome in 168 B.C., and about the same time Ascirvium, or Ascrivum, the modern Cattaro, is first mentioned as a neighbouring city. Justinian built a fortress above Ascirvium in A.D. 535, after expelling the Goths, and a second town probably grew up on the heights round it, for Constantine Porphyrogenitus in 1020, alluded to it as (καταρω μεγάλα Κάταρω οίκοι). The city was plundered by the Saracens in 849, and by the Bulgarians in 1102. In the next year it was ceded to Servia by the Bulgarian tsar Samuel, but revolted, in alliance with Raguza, and only submitted in 1184, as a protected state, preserving intact its republican institutions, and its right to conclude treaties and engage in war. It was already an episcopal see, and, in the 13th century, Dominican and Franciscan monasteries were established to check the spread of Bogomilism.

In the 14th century the commerce of Cattaro rivalled that of Raguza, and provoked the jealousy of Venice. The downfall of Servia in 1389 left the city without a guardian, and, after being seized and abandoned by Venice and Hungary in turn, it passed under Venetian rule in 1420. It was besieged by the Turks in 1538 and 1637, visited by plague in 1572, and nearly destroyed by earthquakes in 1593 and 1667. By the treaty of Campo-Formio in 1797 it passed to Austria; but in 1805, by the treaty of Pressburg, it was assigned to Italy, and was united in 1810 with the French empire. In 1814 it was restored to Austria by the peace of Vienna. The attempt to enforce compulsory military service, made in 1860, but finally abandoned in 1861, led to two short-lived revolts among the Krivoscians, during which Cattaro was the Austrian headquarters.

See G. Gelech (Gelíč), Memorie storiche sulle Bocche di Cattaro (Zara, 1880).

CATTEGRAT, or Kattegat (Scand. "cat's-throat"), a strait forming part of the connexion between the Baltic and the North Sea. It lies north and south between Sweden and Denmark, and connects north with the Skagerrack and south through the Sound, the Great Belt and the Little Belt with the Baltic Sea. Its length is about 150 m. and its extreme breadth about 90 m.

CATTERMOLE, GEORGE (1800–1868), English painter, chiefly in water-colours, was born at Dickleburgh, near Diss, Norfolk, in August 1800. At the age of sixteen he began working as an architectural and topographical draughtsman; afterwards he contributed designs to be engraved in the annuals then so popular; thence he progressed into water-colour painting, becoming an associate of the Water-Colour Society in 1822, and a full member in 1833. In 1850 he withdrew from active connexion with this society, and took to painting in oil. His most fertile period was between 1853 and 1860. At the Paris exhibition of 1855 he received one of the five first-class gold medals awarded to British painters. He also enjoyed professional honours in Amsterdam and in Belgium. He died on the 24th of July 1868. Among his leading works are "The Murder of the Bishop of Liége" (19th century), "The Armourer relating the Story of the Sword," "The Assassination of the Regent Murray by Hamilton of Bothwellhaugh," and (in oil) "A Terrible Secret."
He was largely employed by publishers, illustrating the Waterley Novels and the Historical Annual of his brother the Rev. Richard Cattermole (his scenes from the wars of Cavaliers and Roundheads in this series are among his best engraved works), and many other volumes besides. Cattermole was a painter of no inconsiderable gifts, and of great facility in picturesque resource; he was defective in solidity of form and texture, and in realism or richness of colour. He excelled in rendering scenes of chivalry, of medievalism, and generally of the romantic aspects of the past.

**CATTLE** (Norman Fr. *cattel*, from Late Lat. *capitale*, wealth or property, a word applied in the feudal system to movable property and particularly to live stock, and surviving in its wider meaning as “chattel” or “chattle”), a general term for the cows and oxen of agricultural use. For the zoological account, see **BOVIDAE**, and the subordinate articles there referred to; for details concerning dairy-farming, see **DAIRY**.

Oxen appear to have been among the earliest of domesticated animals, as they undoubtedly were among the most important agents in the growth of early civilization. They are mentioned in the oldest written records of the Hebrew and Hindu peoples, and are figured on Egyptian monuments raised over 3000 years B.C.; while remains of domesticated specimens have been found in South America and Australia with the implements and other relics of Neolithic man. In infant communities a man's wealth was measured by the number and size of his herds—Abraham, it is said, was rich in cattle—and oxen for a long period formed, as they still do among many savage or semi-savage tribes, the favourite medium of exchange between individuals and communities.

After the introduction of a metal coinage into ancient Greece, this method of exchange was commemorated by stamping the image of an ox on the new money; while the connexion between cattle and coin as symbols of wealth has left its mark on the languages of Europe, as is seen in the Latin word *pecunia* and the English “pecuniary,” derived from *pecus*, cattle. The value attached to cattle in ancient times is further shown by the Bull figuring among the signs of the zodiac; in its worship by the ancient Egyptians under the title of Apis; in the veneration which has always been paid to it by the Hindus, according to whose sacred legends it was the first animal created by the three divinities directed by the supreme Deity to furnish the earth with animated beings; and in the important part it played in Greek and Roman religion. As such, it was customary to shed the blood of the ox, and the Egyptians could only do so in sacrificing to their gods. Both Hindus and Jews were forbidden to muzzle it when treading out the corn; to destroy it wantonly was a crime among the Romans, punishable with exile.

**Breeds.**—There exist in Britain four interesting remnants of what were at one time numerous enclosed herds of ancient forest cattle, 1 with black or red points, in parks at Chillingham, Cadsow, Vaynol (near Bangor, North Wales) and Chartley. A few of the last have been removed to Woburn. Other representatives of old stock are—a resuscitated white Welsh breed with black points, derived from wild specimens born black; several herds of a white polled breed with black points; a herd of the ancient Polled Suffolk Dun, an excellent milking breed; a White Belted Galloway and a White Belted Welsh breed; the old Gloucester breed at Badminton, with a white rump, tail and underline, related to the now extinct Glamorgan breed, the Shetland breed; and a few herds of Dutch cattle preserved for their superior milking powers.

The remaining races of cattle in the British Isles 2 comprise the Shorthorn, Lincolnshire Red Shorthorn, Hereford, Devon, South Devon, Sussex, Welsh, Longhorn, Red Polled, Aberdeen-Angus, Galloway, West Highland, Ayrshire, Jersey, Guernsey, Kerry and Dexter.

The Shorthorn, Lincolnshire Red Shorthorn, Hereford, Devon, South Devon, Sussex, Longhorn and Red Polled breeds are native to England; the Aberdeen-Angus, Galloway, Highland and Ayrshire breeds to Scotland; and the Kerry and Dexter breeds to Ireland. The Jersey and Guernsey breeds—often spoken of as Channel Island cattle—belong to the respective islands whose names they bear, and great care is taken to keep them isolated from each other. The term Alderney is obsolete, the cattle of Alderney being mainly a type of the Guernsey breed.

Among breeds well known in the United States 3 and not mentioned above, the more important are the Holsteins, large black and white cattle highly valued for their abundant milk production, and the Dutch Belted breed, black with a broad white band round the body, also good milkers.

The Shorthorn 4 is the most widely distributed of all the breeds of cattle both at home and abroad. No census of breeds has ever been taken in the United Kingdom, but such an enumeration would show the Shorthorn far to exceed in numbers any other breed, whilst the great majority of cross-bred cattle contain Shorthorn blood. During the last quarter of the 18th century the brothers Charles Colling (1751–1836) and Robert Colling (1749–1820), by careful selection and breeding, improved the cattle of the Teeswater district in the county of Durham. If the Shorthorn did not originate thus, it is indisputable that the efforts of the Collings had a profound influence upon the fortunes of the breed. It is still a horned breed for most parts of the world except the land of its birth; but a curiously different typal name is far preferable, for the term “short horn” is applicable to a number of other breeds. Other skilled breeders turned their attention to the Shorthorns and established famous strains, the descendants of which can still be traced. By Thomas Booth, of Killerby and Warkley in Yorksire (1777), the “Booth” strains of Shorthorns were originated; by Thomas Bates, of Kirklevington in Yorkshire, the “Bates” families 5 (1800).

The Shorthorn is sometimes spoken of as the ubiquitous breed, its striking characteristic being the ease with which it adapts itself to varying conditions of soil, climate and management. It is also called the “red, white and roan.” The roan colour is very popular, and dark red has its supporters, as in the case of the *Lincolnshire Red Shorthorns*; white is not in favour, especially abroad. The Shorthorn breed is more noted for its beef-making than for its milk-yielding properties, although the non-pedigree milk-milling Shorthorn of the north of England is an excellent cow with dual-purpose qualifications of the first order. Moreover, it has been possible to restore milk qualities to certain strains of pedigree blood.

The culmination of what may be termed the Booth and Bates period was in the year 1875, when the sales took place of Lord Dunmore's and William Torr's herds, which realized extraordinary prices. In that black year of farming, 1879, prices were declining, and they continued to do so till within the last few years of the close of the 19th century, when there set in a gradual revival, stimulated largely by the commercial prosperity of the country. The result of extremely high prices when line-bred animals were in fashion was a tendency to breed from all kinds of animals that were of the same tribe, without selection. A deterioration set in, which was aggravated by the over-looking of the milking properties. Shorthorn breeders came to see that change of blood was necessary. Meanwhile, for many years breeders in Aberdeenshire had been holding annual sales of young bulls and heifers from their herds. The late Amos Cruickshank began his annual sales in the 'forties, and the late W. T. Talbot-Croshie had annual sales from his Shorthorn herd in the south-west of Ireland for a number of years. Many Aberdeenshire farmers emigrated to Canada, and bought Shorthorn calves in their country to take with them. The Cruickshanks held their bull sales at that time, and many of their animals were bought by the small breeders in Canada. This continued until 1875, when the Cruickshanks had so much private demand that they discontinued their public sales. Subsequently, when Cruickshank sold his herd privately 6 Shorthorn Society of Great Britain and Ireland (1822). See E. J. Powell, 12 Hanover Square, London, W.

C. J. Bates, Thomas Bates and the Kirklevington Shorthorns; a Contribution to the History of Pure Durham Cattle (Newcastle-upon-Tyne, 1897).
CATTLE

to James Nelson & Sons for exportation, the animals could not all be shipped, and W. Duthie, of Collynie, Aberdeenshire, bought some of the older cows, whilst J. Deane Willas, of Bapton Monar, Wiltshire, bought the yearling heifers. Duthie thereupon resumed the sales that the Cruickshanks had relinquished, his averages being £30 in 1892, about £50 in 1893-1894, and £80 in 1895. These prices advanced through English breeders requiring a little change of blood, and also through the increasing tendency to exhibit animals of great substance, or rather to feed animals for show. The success of this movement strengthened the demand, whilst an inquiry for his line of blood arose in the United States and Canada. A faithful contemporary history of the Shorthorn breed is to be found in Thornton's Circular, published quarterly since 1868; see also J. Sinclair, History of Shorthorn Cattle (1907); R. Bruce, Fifty Years among Shorthorns (1907); A. H. Sanders, Shorthorn Cattle (Chicago, 1901).

The Lincolnshire Red Shorthorns are the best dual-purpose cattle—for milk and meat—that possess a pedigree record, in the United Kingdom, and their uniform cherry red colour has brought them into high favour in tropical countries for crossing with the native breeds. The Hereford breed is maintained chiefly in Herefordshire and the adjoining counties. Whilst a full red is the general colour of the body, the Herefords are distinguished by their white face, white chest and abdomen, and white mane. The legs up to the knee or hock are also often white. As a protection against the sun in a hot climate dark spots on the eyelids or round the orbits are valuable. The horns are moderately long. Herefords, though they rear their own calves, have acquired but little fame as dairy cattle. They are very hardy, and produce beef of excellent quality. Being docile, they fatten easily and readily, and as graziers' beasts they are in high favour.

When the Bates' Shorthorn bubble burst in America about 1877, the Hereford gradually replaced the Shorthorn of the western ranches, and it is now the most numerous ranch animal in the United States and Canada. The bulls beat the bulls of all other breeds in "rustling" capacity. In America the ranch-bred Herefords have got too small in the bone in recent years, and Shorthorns, chiefly of the Scottish type, are being introduced to increase their size by crossing. In the "feed lot" a well-bred Hereford steer eats food more quickly than either the Shorthorn or an Aberdeen-Angus.

In Queensland, Hereford cattle bred from the "Lord Wilton" strain by Robert Christison of Lammermoor have for years been triumphant as beef-producers in competition with the Shorthorn. When these are quartered in the ordinary butchers' fashion, the hind-quarters outweigh the fore-quarters, which is a reversal of the prevailing rule.

North Devons.—The "Rubies of the West," as they are termed from their hue, are reared chiefly in Devon and Somerset. The colour is a whole red, its depth or richness varying with the individual, and in summer becoming mottled with darker spots. The Devons stand somewhat low; they are neat and compact, and possess admirable symmetry. Although a smaller breed than the Shorthorn or the Hereford, they weigh better than either. The horns of the female are somewhat slender, and often curve neatly upwards. Being fine-lined, active animals, they are well adapted for grazing the poor pastures of their native islands, and they turn their food to the best account, yielding excellent beef. They have not yet attained much celebrity as milch kine, for, though their milk is of first-class quality, with a few notable exceptions, many have not been found equal to the best of any breed, but the milking qualities have received more attention from breeders, whose object is to qualify the Devon as a dual-purpose breed.

The South Devon or South Hams cattle are almost restricted to that southern part of the county of Devon known as the Hams, whence they are also called "Hammers." With a somewhat unguainly head, lemon-yellow hair, yellow skin, and large but hardly handsome udder, the South Devon breed more resembles the Guernsey, with which it is supposed to be connected, than the trim-built cattle of the hills of North Devon. The cows are large, heavy milkers, and produce excellent butter. They are rarely seen outside their locality except when they appear in the showyards.

The Sussex breed resembles the North Devon in many respects, but it is bigger, less refined in appearance, less graceful in outline, and of a deeper brown-chestnut colour than the "dainty Devon," as the latter may well be called when compared with them. As a hardy race, capable of thriving on poor rough pastures, the Sussex are highly valued in their native districts, where they were rapidly improved before the end of the 19th century. They are essentially a beef-producing breed, the cows having little reputation as milkers. By stall-feeding they can be ripened for the butcher at an early age. Sussex cattle are said to "die well," that is, to yield a large proportion of meat in the best parts of the carcass.

In the Welsh breed of cattle black is the prevailing colour, and the horns are fairly long. They do not mature very rapidly, but some of them grow eventually into great ponderous beasts, and their beef is of prime quality. The cows often possess considerable reputation as milkers. As graziers' beasts Welsh cattle are well known in the midland counties of England, where, under the name of "Welsh runts," large herds of bullocks are fattened in the pastures or "topped up" in the yards in winter. All the remaining strains of Welsh beef cattle were recognized as one breed in 1904, when the Welsh Black Cattle Society united into one register the Herd Books of North and South Wales.

The Longhorn or "Disheamb" breed of cattle is one of the most interesting historically. It was with Longhorns that Robert Bakewell, of Disheley, Leicestershire (1726-1795), showed his remarkable skill as an improver of cattle in the middle of the 18th century. At one period Longhorns spread widely over England and Ireland, but, as the Shorthorns extended their domain, the Longhorns made way for them. They are big, rather clumsy animals, with long drooping horns, which are very objectionable in these days of cattle transport by rail and sea. They are slow in coming to maturity, but are very hardy. The bullocks feed up to heavy weights, and the cows are fair milkers. No lover of cattle can view these quaint creatures without a feeling of satisfaction that the efforts made to resuscitate a breed which has many useful qualities to commend it have been successful, and that the extinction which threatened it in the 'eighties of last century is no longer imminent. In 1906 there were twenty-two Longhorn herds containing about four hundred registered cattle located mainly in the English midlands and Man.

The Red Poll breed, though old, has only come into prominence within recent years. They were known as the East Anglian Polls, and later as the Norfolk and Suffolk Poll cattle, being confined chiefly to these two counties. They are symmetrically built, of medium size, and of uniformly red colour. They have a tuft of hair on the poll. As dairy cattle, they are noted for the length of the period during which they continue in milk. Not less are they valued as beef-producers, and, as they are hardy and docile, they fatten readily and mature fairly early. Hence, like the Lincolnshire Red Shorthorn, they may claim to be a dual-purpose breed. As beef cattle they are always seen to advantage at the Norwich Christmas cattle show, held annually in November.

The Aberdeen-Angus, a polled, black breed, the cows of which are often termed "Doddies," belongs to Aberdeenshire and adjacent parts of Scotland, but many herds are maintained in England and some in Ireland. The steers and heifers fed for the butcher attain great weight, make first-class show beasts, and yield beef of excellent quality. The cross between the Shorthorn and the Aberdeen-Angus is a favourite in the meat markets and at fat-stock competitions.

The Galloways are named from the district, Kirkcudbright and Wigtonshire, in the south-west of Scotland, to which they are native. Like the Aberdeen-Angus cattle, they are hornless, and normally of a black colour. But, with a thicker hide and shaggy hair, suited to a wet climate, they have a coarser appearance than the Aberdeen-Angus, the product of a less humid region, though

BREEDS OF IRISH AND CHANNEL ISLANDS CATTLE.

The comparative sizes of the animals are indicated by the scale of reproduction of the photographs.
It approaches the latter in size. Galloways yield superior beef, but mature less rapidly than the Aberdeen-Angus. They make admirable beasts for the grazer, and the cross between the Galloway and the white Shorthorn bull, known as a "Blue Grey," is much sought after by the grazer and the butcher.

The West Highland or Kylc breed are perhaps the most hardy and picturesque of British cattle. Their home is amidst the wild romantic scenery of the Highlands and the Western Isles of Scotland, though Highland bullocks with long, spreading curved horns may be seen in English parks. They have not made much progress towards early maturity, but their slowly ripened beef is of the choicest quality. The colour of their thick shaggy hair varies from white and light dun to tawny yellow of many shades, and black.

The Ayrshires are the dairy breed of Scotland, where they have considerably overstepped the limits of the humid western county whence they take their name. They are usually of a white and brown colour, the patches being well defined. The neat, shapely, upstanding horns are characteristic. The Ayrshires are under medium size and move gracefully, and the females display the wedge-shape typical of dairy cows. They are a hardy breed, and, even from poor pastures, give good yields of milk, especially useful for cheese-making purposes. The milking powers of the breed are being improved under a system of milk-testing and records supported by the Highland and Agricultural Societies.

The Jerseys are graceful, deer-like cattle, whose home is in the island of Jersey, where, by means of stringent regulations against the importation of cattle, the breed has been kept pure for many generations. As its milk is especially rich in fat (so rich that it requires to be diluted with a little water before it can be safely fed to calves), the Jersey has attained a wide repute as a butter-producing breed. It is a great favourite in England, where many pure-bred herds exist. The colours most preferred are "white" and "fawn" of many shades. The light silver-grey, which was in high repute in England in the early seventies of the 19th century, is out of favour. Browns and brindles are rarely seen. The grey zone surrounding the black muzzle gives the appearance designated "mealy-mouthed." The horns are short, and generally artificially curved inwards; the bones are fine. The best milch cows have a yellowish circle round the eye, and the skin at the extremity of the tail is of a deep yellow, almost orange colour. The cows are gentle and docile when reared in close contact with human beings, but the bulls, despite their small size, are often fierce.

Guernsey cattle are native to the islands of Guernsey, Alderney, Sark and Herm. They are not pure to importation restrictions. Herds of pure-bred Guernseys also exist in the Isle of Wight and in various counties of England and Scotland. They have not the refined and elegant appearance of the Jerseys, which, however, they exceed in size. They are usually of a rich yellowish brown colour, patched with white, in some cases their colour almost meriting the appellation of "orange and lemon." The yellow colour inside the ears is a point always looked for by judges. The cows, large-bellied and narrow in front, are truly wedge-shaped, the greatly developed udder adding to the expanse of the hinder part of the body. They yield an abundance of milk, rich in fat, and are excellent butter-producers. The horns are yellow at the base, curved, and not coarse. The nose is flesh-coloured and free from black markings.

The Canadian breed, black with a narrow brown stripe down the back and a light ring round the muzzle, are descended from old Brittany cattle imported into Canada by French settlers three hundred years ago, and are in consequence related to the Channel Islands cattle. They are remarkably hardy and good milkers, and it is claimed they produce butter fat at 2 c. a lb less cost than any other breed.

The Kylc is a breed of small black cattle belonging to the south-west of Ireland, whence they have spread into many parts, not only of their native land, but of England as well. Although they are able to subsist on the roughest and scantiest of fare, and are exceedingly hardy, the cows are, nevertheless, excellent milkers, and have acquired celebrity as a dairy breed. The colour is black, but the cows sometimes have a little white on the udder. The horns are white, with black tips, and are turned upwards. The Kerry is active and graceful, long and lithe in body, and light-limbed. On the rich pastures of England it has increased considerably in size.

The Dexter breed is reputed to take its name from one Dexter, agent of Maude, Lord Hawarden, who is credited with having established it by selection and breeding from the best mountain types of the Kerry. Until recently it was called the Dexter-Kerry. It is smaller and more compact than the Kerry, shorter in the leg, and intoed before and behind. Whilst valuable as a beef-making animal, it is equally noted for its milk-producing capacity. Black is the usual colour, but red is also recognized, with, in either case, a little white. When of a red colour, the appearance of the animal has been aptly compared to that of a grand Shorthorn viewed through the wrong end of a telescope. The Kerry and the Dexter are readily distinguishable. The Kerry has a gay, light, deer-like head and horn, light limbs and thin skin. The Dexter has coarser limbs, a square body, flat back, thick shoulder, short neck, and head and horn set on low. A herd of Dexter-Shorthorns was founded by Major Barton at Straffan, Ireland, in 1860, in which prominent characteristics of the two breeds have been permanently blended so that they breed true to type.

As milk-producers and therefore as dairy cattle, certain strains of the Shorthorn (registered as well as non-pedigree), the Lincolnshire Red Shorthorn, South Devon, Longhorn, Red Polled, Ayrshire, Jersey, Guernsey, Kerry and Dexter breeds have acquired eminence. Such breeds as the Shorthorn, Lincolnshire Red Shorthorn, South Devon, Welsh, Red Polled and Dexter are claimed as useful beef-makers as well as milk-producers, and are classified as dual-purpose animals. The others belong to the beef-producers. As regards colour, red is characteristic of the Lincolnshire Shorthorn, the Hereford, Devon, Sussex and Red Polled. Black is the dominating colour of the Welsh, Aberdeen-Angus, Galloway, Kerry and Dexter. A yellowish hue is seen in the West Highland, Guernsey and South Devon breeds. Various shades of fawn colour are usual in Jersey cattle and also appear among Highlanders. The Herefords, though with red bodies, have white faces, manes, and dewlaps, whilst white prevails to a greater or less extent in the Shorthorn, Longhorn and Ayrshire breeds. The Shorthorn breed is exceedingly variable in colour; pure-bred specimens may be red, or white, or roan, or may be marked with two or more of these colours. Black is not seen in a pure-bred Shorthorn. The biggest and heaviest cattle come from the beef-making breeds, and are often crossed bred. Very large or heavy beasts, if pure-bred, usually belong to one or other of the Shorthorn, Hereford, Sussex, Welsh, West Highland Aberdeen-Angus and Galloway breeds. The Devon, Red Polled and Guernsey are medium-sized cattle; the Ayrshires are smaller, although the bullocks grow larger than bulls or cows. The Jerseys are small, graceful cattle, but the smaller type of the smaller cattle is the smallest of the British Isles.

See generally the Herd Books of the various breed societies.

(W. Fr.; R. W.)

Rearing and Feeding—A calf at birth scales from one-twelfth to one-fourteenth the weight of the dam. A suckling calf of one of the large breeds should gain 3 lb per day for the first month, 2.5 lb for the second, and 2 lb during the later calf period. Colostrum, or first-day milk after calving, contains more than five times the albuminoid compounds found in average cows' milk. In the course of three or four days it gradually becomes normal in composition, although the peculiar flavour remains a few days longer. Nature has specially prepared it for the young.

1 See E. Wolff, Farm Foods, by H. H. Cousins (1895); A. D. Hall, Rothamsted Experiments (1905); R. Warington, Chemistry of the Farm (1906); W. A. Henry, Feeds and Feeding (1907); H. W. Mumford, Beef Production (1907); H. P. Armsby, Animal Nutrition (2nd ed., 1908); T. Shaw, Animal Breeding (1903); R. Wallace, Farm Live Stock of Great Britain (4th ed., 1907).
CATULLUS

Calf with extremely nourishing and also laxative properties, and it is of practically no value for any other purpose. Normal cows’ milk has an albuminoid ratio slightly narrower than 1:4:coelhostrum 1:71. The ratio is arrived at by adding to the percentage of milk-sugar, possessing about the food equivalent of starch, the fat multiplied by 2.286, and dividing by the total albuminoids—all digestible.

Common nutrient ratios for older animals are stated in the following table of food standards by Dr. Emil Wolff:

Digestible albuminoid nitrogen is the scarcest and consequently the costliest ingredient in food-stuffs, but, since the introduction of vegetable protein made by Mitchell’s process from the castor bean, an easy and inexpensive means of balancing cattle food ratios is available. By this means the manurial value of the excrement is increased. The calculations necessary in arriving at a ratio are simplified by the employment of Jeffers’s calculator (Plainsboro, N. J.).

There are three common methods of rearing calves. (1) The calf sucks its mother or foster-mother. This is the natural method and the best for the show-yard and for early fattening purposes; but it is the most expensive, and the calves, if not handled, grow up wild and dangerous. Store stock may be also raised by putting two calves to one cow and weaning at three months old; a second pair in turn yielding place to a single calf. (2) Full milk from the cow at about 90° F. is given alone until the latter part of the milk period; then the calf is taught to eat supplementary foods to preserve the calf-fat after weaning. A large calf at first receives daily three quarts of milk at three meals. The amount is increased to 2 gallons by the end of the fourth week, and to 3 1/2 gallons at 3 months, when gradual weaning begins. Linseed cake meal is specially suitable for such calves. (3) The calf receives full milk from the mother for one to two weeks, or better, for three to four weeks; then it is slowly transferred to foraged separated milk or milk substitutes. Cod-liver oil, 2 oz. daily, is a good substitute for butter fat. In America cotton-seed oil, 1 oz. to the quart of milk, or an equivalent of oleomargarine heated to 110° F. and churned with separated milk, has produced a live-weight-increase of 2 lb. daily. Linseed simmered to a jelly and added to separated milk gives good results. Moderate amounts are easily digested. Oatmeal or maize meal containing 10% of linseed meal does well, later, at less cost. Milk substitutes and calf meals require close attention in preparation, and would not fetch the prices they do if feeders possessed the technical knowledge necessary to select and mix common foods. Ground cake or linseed meal is, after a time, better given dry than cooked, being then better masticated and not so liable to produce indigestion.

Grass or fine hay in racks is provided when the calf can chew the cud. As cattle get older, live-weight-increase grows less. Smithfield weights show that a good bullock up to a year old will increase 2 lb daily, a two-year-old 1 lb, and a three-year-old a little over 1 lb.

Cattle feeding on a farm consume crude produce that is convenient to market, and make farmyard manure; but there is frequently no profit left. To secure the balance on the right side the inlaid price per live cwt. requires to be 50 lb. less than the sale price—say 35 lb. per cwt. for lean cattle, and 37 lb. per cwt. for the animal when sold fat and capable of producing 60% of dressed beef. The ordinary animal yields only about 57%. A well-bred fattening bullock begins with 2 lb of cake and meal per day, increasing to 8 lb at the end of five months (6 lb on an average), and receives 1/2 cwt. of roots and 12 lb of straw; at an average cost of about 45. 3d. per imperial stone or 50s. per cwt. of dressed carcass. Heifers feed faster than bullocks, and age tells on the rate at which an animal will mature: a three-year-old will develop into prime beef more quickly and easily than a two-year-old. It is difficult to produce “baby beef” at a profit, and it can only be done with picked animals of the best flesh-producing breeds, which cannot be bought at a price per cwt. below the finished sale price, for animals producing baby beef must from start to finish (under two years old) be at all times fit to go to the fat market. It is true that a very young animal can give a better account of food than an older one, but this advantage is counterbalanced by the tendency to grow rather than to fatten. (See also Agriculture.)

In cold and stormy districts cattle thrive best in covered courts, but in a mild climate they do equally well in open yards with shelter-sheds. The more air they get the less liable they are to tuberculosis—example Lincolnshire and the drier south-eastern counties. The ideal method of house-feeding cattle is singly in boxes 10 ft. square, where they are undisturbed, and where the best manure is made because it is not washed by rain.

On the finest British grazing lands two lots of cattle are fed in one season. The first is finished early in July, having, without artificial feeding, laid on eight to nine stones of beef. The second lot requires three or four pounds of undecorticated cotton cake each towards the end of September and in October when grass begins to fail. (R. W.)

CATULLUS, GAIUS VALERIUS (784-54 B.C.), the greatest lyric poet of Rome. As regards his names and the dates of his birth and death, the most important external witness is that of Jerome, in the continuation of the Eusebian Chronicle, under the year 87 B.C., "Gaius Valerius Catullus, scriptor lyricus Veriae nascitur," and under 57 B.C., "Catullus xxx. aeitis anno Romae mortuir." There is no controversy as to the gentle name, Valerius. Suetonius, in his Life of Julius Caesar (iii. 73), mentions the poet by the name "Valerium Catullus." Other persons who had the cognomen Catullus belonged to the Valerian gens, e.g., M. Valerius Catullus Messalinus, a delator in the reign of Domitian, mentioned in the fourth satire of Juvenal (i. 113):—

"Et cum mortifero prudens Veiento Catullo."

Inscriptions show, further, that Valerius was a common name in the native province of Catullus, and belonged to other inhabitants of Verona besides the poet and his family (Schwabe, Quaestiones Catullianae, p. 27). Scholars have been divided in opinion as to whether his praenomen was Gaius or Quintus, and in the best MSS. the volume is called simply Catulli Verenenses liber. For Gaius we have the undoubted testimony, not only of Jerome, which rests on the much earlier authority of Suetonius, but also that of Apuleius. In support of Quintus a passage was quoted from the Natural History of Pliny (xxvii. 6, 61). But the praenomen Q. is omitted in the best MSS., and in other passages of the same author the poet is spoken of as "Catullus Verus." The agreement of the remaining witness with Q. Catulus, the colleague of Marius in the Cimbric War, himself also the author of lyrical poems. Allusions in the poems show that the date of his death given by Jerome (57 B.C.) is wrong, and that Catullus survived the second consulship of Pompey (55 B.C.) (cf. iv. 6, cxliii. 2), and was present in August of the

1 E. J. Powell, History of the Smithfield Club from 1798 to 1900 (1902).
following year at the prosecution of Vatinius by Licinius Calvus (cf. liii.). The allusion in lii. 3—

"Per consilium pecertat Vatinius,"
does not prove that Catullus must have lived to see the consulship bestowed on Vatinius in the end of 45 B.C. but only that Vatinius, after being praetor in 55 B.C., was in the habit of boasting of the certainty of his attaining the consulship, as Cleopatra was in the habit of confirming her most solemn declarations by appealing to her hope of one day administering justice in the Capitol (cf. Hauk, "Quaestiones Catullianae," Ossicula, vol. i. 187). There is then nothing to prove that Catullus lived beyond the month of August 54 B.C. Some of the poems (as xxxviii. and lii.) may have been written during his last illness. If he died in 54 B.C. or early in 53 B.C., Catullus must either have been born later than 87 B.C., or have lived to a greater age than thirty. Catullus is described by Ovid as "hedera iuvallena cinctus Tempora" (Amor. iii. 9. 61),—a description somewhat more suitable to a man who dies in his thirtieth year than to one who dies three or four years later. Further, the age at which a man dies is more likely to be accurately remembered than the particular date either of his birth or of his death, and the common practice of recording the age of the deceased in sepulchral inscriptions must have rendered a mistake about this less likely to occur. It seems, therefore, on the whole, most likely that Jerome's words "xxx. aetatis anno" are correct, and that Catullus was born in 84 B.C.

The statement that he was born at Verona is confirmed by passages in Ovid and Martial. Pliny the elder, who was born at Como, speaks of Catullus in the preface to his Natural History, as his "countryman" (conteraneus), and the poet speaks of Verona as his home, or at least his temporary residence, in more than one place. His occasional residence in his native place is further attested by the statement of Suetonius (Julius Caesar, 73), that "Julius Caesar accepted the poet's apology for his scurrilous verses upon him, invited him to dine with him on the same day, and continued his intimacy with his father as before." As this incident could only have happened during the time that Julius Caesar was pro-consul, the scene of it must have been in the Cisalpine province, and at the house of the poet's father, in or near Verona. The verses apologized for were those contained in poems xxix. and Ixxi., the former of which must have been written after Caesar's invasion of Britain, so that this interview probably took place in the winter of 55-54 B.C. The fact that his father was the host of the great pro-consul, and lived on terms of intimacy with him, justifies the inference, that he was, in wealth and rank, one of the principal men of the province. The only other important statement concerning the poet's life which rests on external authority is that of Apuleius, that the real name of the Lesbia of the poems was Clodia. Another, which concerns the reputation which he enjoyed after his death, is given in the Life of Atticus by Cornelius Nepos (12. 4). It is to the effect that he regarded Lucretius and Catullus as the two greatest poets of his own time.

The poems of Catullus consist of 116 pieces, varying in length from 2 to 408 lines, the great mass of them being, however, short pieces, written in lyric, iambic or elegiac metre. The arrangement cannot be the poet's; it is neither chronological nor in accordance with the character of the topics. The shorter poems, lyric or iambic, are placed first, next the longer epithalamia, (most being written in hexameters) amongst which the Attis is inserted and then those written in the elegiac metre. But, though no chronological order is observed, yet internal evidence enables us to determine the occasions on which many of the poems were written, and the order in which they followed one another. They give a very vivid image of various phases of the poet's life, and of the strong feelings with which persons and things affected him. They throw much light also on the social life of Rome and of the provincial towns of Italy in the years preceding the outbreak of the second civil war. In this respect they may be compared with the letters of Cicero.

The poems extend over a period of seven or eight years, from 61 or 62 till 54 B.C. Among the earliest are those which record the various stages of the author's passion for Lesbia. It is in connection with this passion that he is generally mentioned, or alluded to, by the later Roman poets, such as Propertius, Ovid, Juvenal and Martial. Her real name, as we learn from Apuleius, was Clodia. The admiration of Catullus for Sappho, the Lesbian poetess, which is clearly indicated by the imitation of her language in his fifty-first and sixty-second poems, affords an obvious explanation of the Greek name which he gave to his Roman mistress. Clodia was the notorious sister of Publius Clodius Pulcher, and in the year 56 she charged M. Caecilius Rufus, after tiring of him, as she had of Catullus, with an attempt to poison her. It was in defence of Rufus that Cicero described the spell she exercised over young men, in language which might have been applied to her previous relations with the youthful poet, as well as those with the youthful orator and politician.

Poems concerning Lesbia occur among both the earliest and the latest of those contained in the series. They record the various stages of passion through which Catullus passed, from absolute devotion and a secure sense of returned affection, through the various conditions of distrust and jealousy, attempts at remission, and short intervals of reconciliation, to the "odi et amo" state, and the later state of savage indignation against both Lesbia and his rivals, and especially against Caecilius Rufus, till he finally attains, not without much suffering and loss, the last state of scornful indifference. Among the earliest of the poems connected with Lesbia, and among those written in the happiest vein, are ii. and iii., and v. and vii. The 8th, "Miser Catulle, desinas ineptor," perhaps the most beautiful of them all, expresses the first awakening of the poet to a sense of her unworthiness, before the gentler have given place to the fiercer feelings of his nature. His final renunciation is sent in a poem written after his return from the East, with a union of imaginative and scornful power, to his two butts, Furius and Aurelius (xi., "Furi et Aurell, comites Catulli"), who, to judge by the way Catullus writes of them, appear to have been hangers-on upon him, who repaid the pecuniary and other favours they received by giving him grounds for jealousy, and making imputations on his character (cf. xv., xvi., xviii., xxii.).

The intrigue of Caecilius Rufus with Lesbia began in 59 or 58 B.C. It was probably in the earlier stages of this liaison that the 68th poem was written, from which it appears that Catullus, at the time living at Verona, and grieving for the recent death of his brother in the Troad, had heard of Lesbia's infidelity, and, in consideration of her previous faithlessness in his favour, was not inclined to resent it very warmly. Two other poems in the series express the grief which Catullus felt for the death of his brother,—one, the 65th, addressed to the orator Hortensius, who is there, as in some of Cicero's letters, called Hortalus or Oratus, and sent to him along with the Coma Berenices (Ixxi.), a translation of a famous elegy of Callimachus. The other poem referring to this event (ci.) must have been composed some years later, probably in 56 B.C., when Catullus visited his brother's tomb in the Troad, on his return from Bithynia. Between 59 and 57 B.C. most of the lampoons on Lesbia and her numerous lovers must have been written (e.g. xxxviii., xxxix., &c.). Some, too, of the poems expressive of his more tender feelings to her, such as viii. and lxvi. belong also to these years; and among the poems written either during this period or perhaps in the early and happier years of his liaison, some of the most charming of his shorter pieces, expressing the affection for his young friends Verannius and Fabullus (ix., xii., xiii.), may be included.

In the year 57 the routine of his life was for a short time broken by his accompanying the propraetor C. Memmius, the friend to whom Lucretius dedicates his great poem, as one of his staff, to the province of Bithynia. His object was probably to better his fortunes by this absence from Rome, as humorous complaints of poverty and debt (xiii., xxvi.) show that his ordinary means were insufficient for his mode of life. He frankly acknowledges the disappointment of these hopes, and still more frankly his disgust with his chief (x., xxviii.). Some of the most charming and perfect among the shorter poems express the delight with which the poet changed the dulness and sultry climate of the
province for the freedom and keen enjoyment of his voyage home in his yacht, built for him at Amastris on the Euxine, and roofed with beauty and peace of his villa on the shores of Lake Bœnacus, which welcomed him home “wearied with foreign travel.” To this period and to his first return to Rome after his visit to his native district belong the poems xvi., ci., iv., xxxi., and x., all showing by their freshness of feeling and vivid truth of expression the gain which the poet’s nature derived from his temporary escape from the passions, distractions and animosities of Roman society. Two poems, written in a very genial and joyous spirit, and addressed to his younger friend Licinius Calvus (xiv. and l.), who is ranked as second only to himself among the lyrical poets of the age, and whose youthful promise pointed him out as likely to become one of the greatest of Roman orators, may, indeed, with most probability be assigned to these later years (xiv.). From the expression “Odissæm te odio Vatiani,” in the third line of xiv., it may be inferred that the poem was not written earlier than December (the “Saturnalia”) of the year 56 B.C., as it was early in that year, as we learn from a letter of Cicero to his brother Quintus (ii. 4, 1), that Calvus later announced his intention of prosecuting Vatinius. The short years of his life which would be written in August 54 B.C. The poems which have left the greatest stain on the fame of Catullus—those “referta contumelios Caesaris,” the licentious abuse of Mamurra, and probably some of those personal squabbles addressed to women as well as men, or too frank confessions, which posterity would willingly have let die, may well have been written in the last years of his life, under the influence of the bitterness and recklessness induced by his experience. It cannot be determined with certainty whether the longer and more artistic pieces, which occupy the middle of the volume—the Epithalamium in the marriage of Manlius Torquatus, the 62nd poem, written in imitation of the Epithalamia of Sappho, “Vesper adest: iuvenses, consurgite”; the Aitís, and the Epic Idyll representing the marriage festival of Peleus and Thetis—belong to the earlier or the later period of the poet’s career. If the person addressed in the first part of the 68th is the Manlius of the Epithalamium, and the lines from 3 to 8—

“Nafragum ut eictem...pervigilat,”

refer to the death of Vicia, it would follow that the first Epithalamium was written some time before that poem, and thus belongs to the earlier time. While the translations of Sappho—

“Ille mi par esse deo videtur,”

and of Callimachus (ixvi.),—

“Omnia qui magni dispetit lumina mundi,”

belong to the earlier period, the Aitís and the Peleus and Thetis; although perhaps suggested by the treatment of the same or similar subjects in Greek authors, are executed with such power and originality as declare them to be products of the most vigorous stage in the development of the poet’s genius. That his genius came soon to maturity is a reason for hesitation in assigning any particular time between 56 and 54 B.C. for the composition of the Aitís and of that part of the Epithalamium (“Peleus quondam propterea vertice pinus”) which deals with the main subject of the poem. But the criticism of Munro in his edition of Lucretius, which shows similarities of expression that cannot be mere casual coincidences, between the Ariadne-episode in the Epithalamium of Catullus (from line 52 to 266) and the poem of Lucretius, leaves little doubt that that portion at least of the poem was written after the publication of the De rerum natura, in the winter of 55-54 B.C.

No ancient author has left a more vivid impression of himself on his writings than Catullus. Coming to Rome in early youth from a distant province, not at that time included within the limits of Italy, he lived as an equal with the men of his time of most intellectual activity and refinement, as well as of highest social and political eminence. Among those to whom his poems are addressed, or who are mentioned in them, we find the names of Hortensius, Cicero, Cornelius Nepos, Licinius Calvus, Helvius Cinna and Aeshines Pollio, then only a youth (xii. 8). Catullus brought into this circle the genius of a great poet, the social

vivacity of a vigorous nature, the simplicity and sincerity of an unambitious, and the warmth of an affectionate disposition. He betrays all the sensitiveness of the poetic temperament, but it is never the sensitiveness of vanity, for he is characterized by the modesty rather than the self-confidence which accompanies genius, but the sensitiveness of a heart which gives and expects more sympathy and loyalty in friendship than the world either wants or cares to give in return. He shows also in some of his lighter pieces the fastidiousness of a refined taste, intolerant of all boorishness, pedantry, affectation and sordid ways of life. The passionate intensity of his temperament displays itself with similar strength in the outpourings of his animosity as of his love and affection. It was, unfortunately, the fashion of the time to employ in the expression of these animosities a licence of speech and of imputation which it is difficult for men living under different social conditions to understand, still more difficult to tolerate. Munro has examined the 29th poem—

“Quis hoc potest videre, quis potest pati,”

the longest and most important of the lampoons on Caesar and Mamurra, and shown with much learning and acuteness the motives and intention of Catullus in writing them. Had Julius Caesar really believed, as Suetonius, writing two hundred years afterwards, says he did, that “an eternal stigma had been cast upon him by the verses concerning Mamurra,” we should scarcely apply the word magnanimity to his condonation of the offence. But these verses survive as a memorial of any scandal affecting Julius Caesar which could possibly have been believed by his contemporaries, but of the licence of speech which was then indulged in, of the jealousy with which the younger members of the Roman aristocracy, who a little later fought on the side of Pompey, at that time regarded the ascendency of the “father-in-law and the son-in-law,” and the social elevation of some of their instruments, and also, to a certain extent, of the deterioration which the frank and generous nature of Catullus underwent from the passions which wasted, and the faithlessness which marred his life.

The great age of Latin poetry extends from about the year 60 B.C. till the death of Ovid in 17 A.D. There are three marked periods in this period, each with a distinct character of its own: the first represented by Lucretius and Catullus, the second by Virgil and Horace, the last by Ovid. Force and sincerity are the great characteristics of the first period, maturity of art of the second, facility of the last. The educating influence of Greek art on the Roman mind was first fully experienced in the Ciceronian age, and none of his contemporaries was so susceptible of that influence as Catullus. With the susceptibility to art he combined a large share of the vigorous and genial qualities of the Italian race. Like most of his younger contemporaries, he studied in the school of the Alexandrine poets, with whom the favourite subjects of art were the passion of love, and stories from the Greek mythology, which admitted of being treated in a spirit similar to that in which they celebrated their own experiences. It was under this influence that Catullus wrote the Coma Berenices, the 68th poem, which, after the manner of the Alexandrines, interweaves the old tale of Proteus and Laodamia with the personal experiences of the poet himself, and the Epithalamium of Peleus and Thetis, which combines legends from the Greek mythology, one of the secure happiness of marriage, the other of the passionate despair of love betrayed. In this last poem Catullus displays a power of creative pictorial imagination far transcending that displayed in any of the extant poetry of Alexandria. We have no means of determining what suggested the subject of the Aitís to Catullus, whether the previous treatment of the subject by some Greek writer, some survival of the myth which he found still existing during his residence among the “Phrygii Campi,” or the growth of various forms of Eastern superstition and fanaticism, at Rome, in the last age of the Republic. Whatever may have been its origin, it is the finest specimen we possess, in either Greek or Latin literature, of that kind of short poem more common in modern than ancient times, in which some situation or passion entirely alien to the writer, and to his own age, is realized with dramatic intensity.
But the genius of Catullus is, perhaps, even happier in the direct expression of personal feeling than in artistic creation, or the reproduction of tales and situations from mythology. The warmth, intensity and sincerity of his own nature are the source of the inspiration in these poems. The most elaborate and one of the finest of them is the *Epithalamion* in honour of the marriage of a member of the old house of Manlius Torquatus with Viria Aurunculeia, written in the glicony in combination with the pherecratean metre. To this metre Catullus imparts a peculiar lightness and grace by making the trochee, instead of the spondee as in Horace's glicony and pherecratean, the first foot in the line. His elegiac metre is constructed with less smoothness and regularity than that of Ovid and Tibullus or even of Propertius, but as employed by him it gives a true echo to the serious and plaintive feelings of some of his poems, while it adapts itself, as it did later in the hands of Martial, to the epigrammatic terseness of his invective. But the perfection of the art of Catullus is seen in his employment of those metres which he adapted to the Latin tongue from the earlier poets of Greece, the pure iambic trimeter, as in iv.—

"Phaselus ille quem viditest hospiti,"

and the season iambic, employed in viii. and xxxi.—

"Paeinursium, Sirmio, insularurnque,"

and the phaeclian hendecasyllabic, a slight modification of the Sapphic lines, which is his favourite metre for the expression of his more gay moods, and of his lighter satiric vein. The Latin language never flowed with such ease, freshness and purity as in these poems. Their perfection consists in the entire absence of all appearance of effort or reflection, and in the fulness of life and feeling, which gives a lasting interest and charm to the most trivial incident of the passing hour. In reference to these poems Munro has said with truth and force: "A generation had yet to pass before the heroic attained to its perfection; while he (Catullus) had already produced glicony, phaeclians and iambics, each 'one entire and perfect chrysole,' 'cunningest patterns' of excellence, such as Latium never saw before or after.—Alcaeus, Sappho, and the rest then and only then having met their match.

The name of Catullus has not come down to us intact, as is shown by lacunae and quotations in ancient writers which cannot now be found in his poems. Out of the MSS., only three have claims to intrinsic importance. The oldest and best appears to be the Bodleian (Cornelius, 254, f. 39), inferior in the *Halcyonian* (Par. 14137). Of the third, the *Romanus*, we shall be better able to judge when its discoverer, Prof. W. G. Hale, has published his conclusion. None of these MSS. are older than the 14th century. One poem, 62, is, however, among the *Prolegomena* of Haupt's *Medianae Prose* (Par. 8071). Prof. R. Ellis's discovery of the Bodleian MS. and E. Baehrens's recognition of its value opened a new chapter in the history of the text. Ellis's contributions comprise an independent critical commentary (ed. 2. 1889), an elaborate critical edition (ed. 2. 1878) and an English translation (1871) in the metres of the original. The text in the Oxford series, published in 1905, is inferior to those specified above. Baehrens's edition, 2 volumes (text 1876, the second edition by K. P. Schule is a misnomer; and Latin commentary 1885) is still of value. Amongst other editions with critical or explanatory notes or both may be mentioned those of A. Riese (1864), L. Schwa (1886, with index verborum), B. Schmidt (1877), J. J. Winter (ed. facsimilis omnium textorum, *Sicanium* 1880, *Poetarum*, E. Benoist and E. Thomas, with French translation by Rostand (2 vols., 1882-1880), S. G. Owen (1853, an édition de luxe), W. T. Merrill (1893, Boston, U.S.A., with succinct English notes), A. Fahlbusch (1896, one of the best of his scholar's works); and Latin commentary of the text of the three poets Catullus, Tibullus and Propertius, edited by J. Vahlen, reached its sixth edition in 1904. Of the numerous contributions to the textual and literary criticism of the poems may be named the papers in M. Haupt's *Oxfordia*, L. Schwa's *Questions Catulli* (1862), B. Schmidt's *Prolegomena*, H. A. J. Munro's *Criticism and Elucidation of Catullus* (1878; second edition by J. D. Duff, 1908). Translations into English verse by J. Cranston (1854, with index, 1856) and W. C. Woodhouse (1858-1859) in *The Rhine*, (1896, one of the best of his scholar's works); and a recent version in prose with the Latin text by F. W. Cornish (1904). For further information see Teuffel's *History of Roman Literature* (tr. by Ware), § 214, or the more recent accounts by M. Schanz, *Geschichte der lateinischen Poesie* (1909), pp. 143-173. (W. Y. S.; X.)

**CATULLUS**, the name of a distinguished family of ancient Rome of the gens Latulia. The following are its most important members.

1. GAIUS LUTIATUS CATULLUS, Roman commander during the First Punic War, consul 242 B.C. He was sent with a fleet of 200 ships to Sicilian waters, and almost without opposition occupied the harbours of Lilybaeum and Drepanum. A hurriedly equipped fleet sent out from Carthage under Hannu was intercepted by the praetor Publius Valerius Faito and totally defeated (battle of the Aegean Islands, March 10, 241). Catullus, who had been wounded at Drepanum, took no part in the operations, but on his return to Rome was accorded the honour of a triumph, which against his will he shared with Valerius. (See Punic Wars: First, ad fin.).

2. QUINTUS LUTIATUS CATULLUS, Roman general and consul with Marius in 102 B.C. In the war against the Cimbri and Teutones he was sent to defend the passage of the Alps but found himself compelled to retreat over the Po, his troops having been reduced to a state of panic (see MARIUS, CATULLUS). In 101 the Cimbri were defeated on the Raudine plain, near Vercellae, by the united armies of Catullus and Marius. The chief honour being ascribed to Marius, Catullus became his bitter opponent. He sided with Sulla in the civil war, was included in the proscription list of 87, and when Marius declined to pardon him, committed suicide. He was distinguished as an orator, poet and prose writer, and was well versed in Greek literature. He is said to have written the history of his consulship and the Cimbrian War after the manner of Xenophon; two epigrams by him have been preserved, one on Roscius the celebrated actor (Cicero, *De Nat. Orat.*, i. 28), the other of an erotic character, imitated from Callimachus (Gellius xix. 9). He was a man of great wealth, which he spent in beautifying Rome. Two buildings were known as "Monumenta Catulli": the temple of Fortuna huiusce diei, to commemorate the day of Vercellae, and the Porticus Catulli, built from the sale of the Cimbrians spoils.

See Plutarch, Marius, Sulla; Appian, B.C. i. 74; Vell. Pat. ii. 21; Florus iii. 21; Val. Max. vii. 3, ix. 13; Cicero, *De Oratore*, iii. 3, Brutus, 35.

3. QUINTUS LUTIATUS CATULLUS (c. 120-61 B.C.), sometimes called Capitolinus, son of the above, consul in 102. He inherited his father's hatred of Marius, and was a consistent though moderate supporter of the aristocracy. In 78 he was consul with Marcus Aemilius Lepidus, who after the death of Sulla proposed the overthrow of his constitution, the re-establishment of the distribution of grain, the recall of the banished, and other democratic measures. Catullus vigorously opposed this, and a temporary compromise was effected. But Lepidus, having defeated a Franco-Gallic army, returned to Rome at the head of an army. Catullus defeated him at the Mulvian bridge and near Casa in Etruria, and Lepidus made his escape to Sardina, where he died soon afterwards. In 67 and 66 Catullus unsuccessfully opposed, as prejudicial to constitutional freedom, the Gabian and Manilian laws, which conferred special powers upon Pompey (q.v.). He consistently opposed Caesar, whom he endeavoured to implicate in the Catilinarian conspiracy. Caesar, in return, accused him of embezzling public money during the reconstruction of the temple on the Capitol, and proposed to obliterate his name from the inscription and deprive him of the office of commissioner for its restoration. Catullus's supporters rallied round him, and Caesar dropped the charge. Catullus was the last princeps senatus of republican times; he held the office of censor also, but soon resigned, being unable to agree with his colleague Licinius Crassus. Although a man of great abilities, Catullus exercised considerable influence through his political consistency and his undoubted solicitude for the welfare of the state.

See Sallust, Catilina, 35, 49; Dio Cassius xxxvi. 13; Plutarch, Crassus; Suetonius, Caesar, 15.

**CAUB**, or **KAUB**, a town of Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, 28 m. N.W. from Wiesbaden, on the railway from Frankfort-on-Main to Cologne. Pop. 2200. It has a Roman Catholic and an Evangelical church, and a statue of Bütcher. The trade mainly consists of the wines of the district. On a cavig above the town stands the
imposing ruin of Gutenfels, and facing it, on a rock in the middle of the Rhine, the small castle Pfalzgrafenstein, where, according to legend, the Palantine countesses waited their confinement, but which in reality served as a toll-gate for merchandise on the Rhine.

Caub, first mentioned in the year 983, originally belonged to the lords of Falkenstein, passed in 1277 to the Rhinensch Pala-
tinate, and attained civic rights in 1324. Here Blücher crossed the Rhine with the Prussian and Russian armies, on New Year's night 1813–1814, in pursuit of the French.

CAUCA, a large coast department of Colombia, South America, lying between the departments of Bolivar, Antioquia, Caldas and Tolima on the E., and the Pacific Ocean and Panama on the W., and extending from the Caribbean Sea S. to the department of Nariño. Pop. (1905, estimate) 400,000; area 26,030 sq. m. Although Cauca was deprived of extensive territories on the upper Caquetá and Putumayo, and of a large area bordering on Ecuador in the territorial redistribution of 1903, it remained the largest department of the republic. The Western Cordillera, traversing nearly its whole length from south to north, and the Central Cordillera, forming a part of its eastern frontier, give a very mountainous character to the region. It includes, besides, the fertile and healthful valley of the upper Cauca, the hot, low valley of the Atro, and a long coastal plain on the Pacific. The region is rich in mines and valuable forests, but its habitants have made very little progress in agriculture because there are not adequate transportation facilities. The capital of the department is Popayán at its southern extremity, with an estimated population in 1905 of 10,000, other important towns are Cali (16,000), Buga, Cartago and Buenaventura.

CAUCASIA, or CAUCASUS, a governor-generalship of Russia, occupying the isthmus between the Black Sea and the Sea of Azov on the west and the Caspian Sea on the east, as well as portions of the Armenian highlands. Its northern boundary is the Kuma-Manych depression, a succession of narrow, half-deserted basins and river-beds, only temporarily filled with water and connecting the Manych, a tributary of the Don, with the Kuma, which flows into the Caspian. This depression is supposed to be a relic of the former post-Pliocene connexion between the Black Sea and the Caspian, and is accepted by most geographers as the natural frontier between Europe and Asia, while others make the dividing-line coincide with the principal water-parting of the Caucasus mountain system. The southern boundary of Caucasus is in part coincident with the river Aras (Araxes), in part purely conventional and political. It was shifted several times during the 19th century, but now runs from a point on the Black Sea, some 20 m. south of Batum, in a south-easterly and easterly direction to Mt. Ararat, and thence along the Aras to within 30 m. of its confluence with the Kura, where it once more turns south-east, and eventually strikes the Caspian at Astara (39° 35' N). This large territory, covering an area of 180,883 sq. m., and having in 1897 9,248,695 inhabitants (21 pers. sq. m.), may be divided into four natural zones or sections: (i.) the administrative division of Northern Caucasus; (ii.) the Caucasus range and the highlands of Daghestan; (iii.) the valleys of the Rion and the Kura, between the Caucasus range and the highlands of Armenia; and (iv.) the highlands of Armenia.

(i.) The plains of Northern Caucasus, which include most of the provinces of Kuban and Terek and of the government of Stavropol, slope gently downwards from the foot of the Caucasus range towards the Kuma-Manych depression. It is only in their central part that they reach a maximum width, as, e.g., in the Stavropol "plateau," which stretches northwards, separating the tributaries of the Kuban from those of the Terek and the Kuma. Towards the foothills of the Caucasus they are clothed with thick forests, while the grassy plains north of the Caucasus mountains, comprising marshy ground, choked with reeds and rushes, in the delta of the Kuma. In the north and east they give place, as the Manych and the coasts of the Caspian are approached, to arid, sandy, stony steppes. The soil of these plains is generally very fertile and they support a population of nearly 2,800,000 Russians, composed of Cossacks and peasant immigrants, settled chiefly along the rivers and grouped in large, wealthy villages. They carry on agriculture—wheat-growing on a large scale—with the aid of modern agricultural machines, and breed cattle and horses. Vineyards are extensively cultivated on the lower levels, and a variety of domestic trades are prosecuted in the villages. The higher parts of the plains, which are drained by the numerous tributaries of the riv[ers by various Caucasian races—Karabards and Circassians (Circassians) in the west, Ossetes in the middle, and several other tribes from Daghestan, described under the general name of the Chechens, in the east; while nomadic Nogai Tatars and Turkomans occupy the steppes.

(ii.) The Caucasus range runs from north-west to south-east from the Strait of Kerch to the Caspian Sea for a length of 900 m., with a breadth of 390 m., and covers a surface of 12,000 sq. m. The orographical characteristics of the Caucasus are described in detail under that heading.

(iii.) The combined valleys of the Rion and the Kura, which intervene between the Caucasus and the Armenian highlands, and stretch their north-west side, about 380 m. from Don to the Caspian, are, with the steppes, the most populous and most fertile parts of Caucasus. They correspond roughly with the governments of Kutas, Tiflis, Elisavetpol and Baku, and have a population of nearly 3,600,000. The two valleys are separated by the almost perpendicular 16,000 m. short gorge of the Rion, while the abrupt escarpment, having the characteristics of a border ridge of the Armenian highlands, fronts it on the south. The floor of the valley slopes gently eastwards, from 1200 ft. at Tiflis to 500 ft. at the Caspian, and to 200 ft. at the Rise of the Manych.

But the uniformity of the slope is interrupted by a plateau (2000-3000 ft. in altitude) along the southern foothills of the east central Caucasus, in the region known as Kakheta, drained by the Alazan, and extending to the south-west and north-west, The chief drainage of the region, with which the southern slopes of the Caucasus are inhabited by Ossetians, Tushes, Pshavs and Khevsurs, in the west, and by various tribes of Lebeds in the east. In these high and stony valleys runs a number of small tributaries which ultimately unite to form the Kura, even up to altitudes of 7000 and 8000 ft. above the level of the sea; but cattle-breeding is the principal resource of the mountaineers, whose little communities are often separated from one another by valleys as few as which are lower than 10,000 ft. The steppes along the bottom of the principal valley are for the most part too dry to be cultivated without irrigation. It is only in Kakheta, where numerous mountain streams supply the fields and gardens of the plateau of Alazan, that wheat, millet and maize are grown, and orchards, vineyards and mulberry groves are everywhere possible.

Lower down the valley cattle-breeding is the chief source of wealth, while in the small towns and villages of the former Georgian kingdom various petty trades, exhibiting a high development of artistic taste and technical skill, are carried on. The fertile and stony highlands are clothed with fine forests, and the vine is grown at their base, while on the wide-stretching steppes the Turko-Tatars pasture cattle, horses and sheep. The lower part of the Kura valley assumes the character of a dry and barren tract. The Ararat depression, usually called at Baku, and is still less in the Mugan steppe, though quite abundant in the adjacent region of Lenkoran. The vegetation of the steppe is on the whole scanty. Trees are generally absent, except in the groves of poplar and willow along the banks of the Kura, the delta of which is smothered under a jungle of reeds and rushes. The Mugan steppe is, however, in spite of its dryness, a more fertile region in virtue of the irrigation practised: but the Kura valley is lower and more fertile than the Mugan, and along its course. The Lenkoran district, sometimes called Talysh, on the western side of the Kizil-Agach bay, is blessed with a rich vegetation, a fertile soil, and a moist climate.

Inhabitants of the Kuban valley consist principally of Iranian Tates and Talyshes, of Armenians and Lezghians, with Russians, Jews and Arabs. This joint valley of the Rion-Kura was in remote antiquity the site of several Greek colonial settlements, where, as a result of the long period of successively being an Asiatic and a European province, for centuries it has formed a bulwark against hostile invasions from the south and east. It is still inhabited chiefly by Georgian tribes—Curians, Imeretians, Mingrelians, Svanetians—in the basin of the Kuban, and by Georgians and Turks in the Kura valley, while the steppes that stretch away from the lower course of the latter river are ranged over by Turko-Tatars. Mingrelia and Imeretia (valley of Rion) are the gardens of Caucasus, but the high valleys of Svanetia, farther north on the south slopes of the Caucasus range, yield wild as well as the best quality in the world. In the parts of the land is so exceedingly fertile and productive that it sells for almost fabulous prices, and its value is still further enhanced by the discovery of manganese and copper mines in the basin of the Kuban, and of the oil, coal and petroleum at Baku in the Apsheran peninsula. The principal products of the soil are mentioned lower down, while the general
character of the vegetation is indicated under CAUCASUS: Western Caucasus.

In the basin of the Rion, in that of the Chorokh (which runs off the Pontic highlands into the Black Sea south of Batum), and on the Black Sea littoral from Batum northwards to Sukhumi-kaleh, and the northern Black Sea littoral from Sukhumi towards the Caspian, certain types of vegetation and flora are developed (see under Climate below). It is in this valley that the principal towns (except Vladikavkaz at the north foot of the Caucasus) are situated, namely, Baku (179,133 inhabitants in 1900), Tiflis (6,000 ft.), Batum (3,392) and the two Black Sea ports of Batum (28,512) and Poti (7666).

(iv.) The highlands of Armenia are sometimes designated the Minor Caucasus, Little Caucasus and Anti-Caucasus. But to use such names is to suppose that there is not only an independent, but also an independent, morphological formation that the Caucasus tends to perpetuate confusion in geographical nomenclature. The Armenian highlands, which run generally parallel to the Caucasus, though at much lower elevations, are a part of the same system, sometimes quite flat, sometimes gently undulating, clad in luxuriant meadow vegetation and most cultivable. From it rise double or triple ranges connected by cross-ridges and spurs. These double and triple ranges, which have a general height of 8500-10,000 ft., stretch from the south-east side of the Black Sea southwards towards the Kura-dagh and Salavat mountains in north Persia, and the latter link on them to the Eilurz mountains that skirt the southern end of the Caspian Sea. Various names are given to the different parallel ranges or groups of ranges, or, what is the same, the constituent groups of mountains. The Ajar, Akhal-sikt and Meskes or Traitya groups in the west are succeeded farther east by the Somkhet, Murugz, Ganji and Karabakh sections, forming the southern rim of the highlands. It is uncertain whether this parallelism is a fact or an apparent one. Generally speaking, the highlands branch off the highest range in the entire series, namely, the Zangezur, which soars up to 10,000 ft. above the left bank of the Aras. From it again there shoot away at right angles, one on each side, a few parallel ranges, and a few separate ones, such as the mountain ranges of the Caspian Sea, the Transcaucasian, and the Caucasian, and the latter in part the Armenian highlands.

In respect of precipitation the entire region of Caucasus may be divided into two strikingly contrasted regions, a wet and a dry. To the former belong the Black Sea littoral, where the rainfall averages 59 to 93 in. annually, and the valleys that open up or are exposed to winds blowing off it, in which the rainfall varies, however, from 20 in. (Abbas-tuman, Borzom) to 60 (Kutaisi). In Lenkoran also the rainfall averages 40 to 50 in. in the year. Between 16 and 40 in. fall as a rule at the northern foot of the Caucasus (Mozdock, Pyatigorsk) and in the Kura valley (Tiflis, Novo-bayazet). On the Armenian highlands and the steppes north of Pyatigorsk the rainfall is less than 12 in. annually, and even in some places less than 8 in., e.g. at the foot of Ararat. Most rain falls at Batum and at Lenkoran in the autumn, in northern Caucasus and in Transcaucasus in spring and summer, but in the vicinity of the Sea of Azov in winter.

Flora and Fauna.—Plant-life, in such a mountainous country as Caucasus, being intimately dependent upon aspect and altitude, is treated under CAUCASUS. The wild animals of Caucasus are for the most part the same as those which frequent the mountainous parts of central Europe, though there is also an irrational of Asiatic forms, e.g. the tiger (in Lenkoran only), panther, hyena and jackal. The more important of the carnivores which haunt the forests, valleys and mountain slopes are the bear (Ursus arctos), wolf, lynx, wild cat and fox (Vulpes melanotus). The wild boar occurs around Borzom. The urochs ( Bos urus) appears to exist still in the forests of the western Caucasus. Of interest for sportsmen, as well as serving as prey for the carnivores, are red deer, goats (Cepro pallis and C. aegagrus), chamois, roebuck, moufflon (Ovis musimon), argali or Asiatic wild sheep (O. Ammon), another species of sheep in O. gmelini, and fallow deer (Ceproloch pigar) in northern Caucasus only. Rodents are numerous, the mouse (Mus syrticus) being very destructive and bears are met with in places.

The birds are prey are the same as those of central Europe, and include the sea eagle, alpine vulture (Gyps fulvus), buzzard, kites (Gypaetus barbatus and Milvus albus), hawks (e.g. Asur niris), goshawk (A. pulex), fish-hawk (Pandion haliaetus) and owls. Among the smaller birds may be enumerated finches, the siskin, bullfinch, pipit, titmuse, wagtail, lark, fine-crested wren, hedge-sparrow, corn-wren, nut-hatch, starling, swallow, martin, swift, thrush, butcher bird, shrike, dipper, yellow-hammer, ortolan and a warbler (Acceor alpinus).

The game birds consist of grouse, blackcock, moorhen, quail and partridge. The pheasant derives its name from the ancient name (Phasis) of the Rion.

In the seas and rivers about 150 species of fishes have been enumerated. Of these, 115 species are Mediterranean, 30 are common to the Caspian Sea, and the remaining species are peculiar to the Black Sea. The most useful economically are several species of sturgeon and of herring, trout, barbel, chub, bream, ray, sea-
CAUCASIA

Religion.—Most of the Russians and the Georgians belong to the Orthodox Greek Church (over 4,000,000 in all); but considerable numbers (estimated at nearly 1,200,000) in reality probably a good many more) are Nonconformists of different denominations. The Georgian Lazes are, however, Mussulmans. The Armenians are Christians, mostly of the national Gregorian Church (979,566), though 34,000 are Roman Catholics. The Caucasian races (except the Georgians), together with the Turks and Tatars, are Mussulmans of the Sunnite sect (2,021,300), and the Iranian races mostly Mussulmans of the Shiite sect (884,100). The Kalmucks and other Mongol tribes are Lamaists (20,300), and some of the Kurds profess the peculiar tenets of the Yezidis.

Industries.—The principal occupation of the settled inhabitants is agriculture and of the nomadic the breeding of live stock, including camels. The cultivation of the soil is carried on mainly in parts with great difficulties owing to the scanty rainfall and the very primitive implements still in use, and in the valley of the Kura heavy losses are frequently incurred from depredations by locusts. But where irrigation is employed the yield of crops is excellent. Rye and wheat are the most important crops harvested in western Russia, but oats, barley and maize are also cultivated, whereas in Transcaucasia the principal crops are maize, rice and tobacco. The beets is grown chiefly in the valley of the Kura and in Lenkoran; the tobacco in the Rion valley and on the Black Sea coastlands, also to some extent in Kuban; and the cotton in the eastern provinces. Various kinds of fodder crops are grown in Transcaucasia, such as hay, rye-grass and lucerne. It is estimated that nearly 54,000 acres are under vineyards in northern Caucasus and some 278,000 acres in Transcaucasia, the aggregate yield of wine being 30 million gallons annually. The best wine grows in Kakheta, a district lying north-east of Tiflis; this district alone yields nearly 8 million gallons annually. Large numbers of mulberry silkworms are reared for export; the mulberry is grown in Kuttas, Erivan, Elisavetpol (Nukha) and Baku (Shemakha); the groves occupy nearly 190,000 acres, and the winding of the silk is used in employment to large numbers of the population. Melons and water-melons are also important objects of cultivation. Sunflowers are very extensively grown for oil in the government of Kuban and elsewhere, and also some flax. Liquorice is another article of export. Many varieties of fruit are grown, especially good being the apricots, peaches, walnuts and hazel nuts. A limited area (not more than 115,000 acres) of the Black Sea coast between Sukhum-kaleh and Batum is planted with the tea-shrub, which succeeds very well. In the same district bamboos, ramié-fibre and avatar (otto) of roses are cultivated.

The mining industry is growing rapidly in importance in spite of costly and difficult means of communication, want of capital, and the general disintegration. So far the principal developments of the industry have been in the government of Kuban, Batum, Elisavetpol and Kuba. Copper ore is extracted above the Murgul river (some 30 m. south of Batum), at Akhalkal south of Tiflis, and at Kedebek in Elisavetpol; manganese to a considerably greater extent (over 400,000 tons annually) at Chaturi in the Kvirila valley in Kuttas. Steam coal of good quality is mined at about 30 m. inland from the open roadstead of Ochemchir in Kuttas, but it is not mined. About 50,000 tons of coal of very poor quality are, however, extracted annually, and the same quantity of salt in the Armenian highlands and in Kuba. Small quantities of quicksilver, sulphur and iron are obtained. But these are insignificant in comparison with the mineral oil industry of Baku, which in normal times yields annually between ten and eleven million tons of crude oil (naphtha). A good deal of this is transported by gravitation from Baku to Batum on the Black Sea by means of a pipe laid overland. The refined oil is used as a substitute for kerosene, the lighter refuse (waste) is used as fuel. Naphtha is also obtained, though in much smaller quantities, in Terek and Kuba, in Tiflis and Daghestan. Numerous mineral springs (chalybeate and sulphurous) exist both north and south of the Caucasus ranges, e.g. at Pyatigorsk.

---

1 Premier Recensement général de la population de l’Empire de Russie, ed. N. Troitsky (St Petersburg, 1905, 2 vols.), in Russian and French.
2 Although the Inuit speak a Chichen dialect, they have recently proved to be, anthropologically, quite a distinct race.
Zhelesnovodsk, Essentuki, and Kislovodsk in Terek, and at Tiflis, Abastumani and Borjom in the government of Tiflis.

Manufacturing industry is confined to a few articles and commodities, such as cement, tea, tin cans (for oil), cotton goods, oil refineries, tobacco factories, flour-mills, silk-winding mills (especially at Shusha and Jbiral in the south of Elisavetpol), distilleries and breweries. On the other hand, the domestic industries are extensively carried on and exhibit a high degree of technical skill and artistic taste. Carpets (especially at Shusha), silk, cotton and woollen goods, felts and fur cloaks are made, and small arms in Dagestan and at Tiflis, Nukha and Sukhum-kaleh; silversmiths' work at Tiflis, Akhaltsikhe and Kutais; pottery at Elisavetpol and Shusha; leather shoe-making at Alexandropol, Nukha, Elisavetpol, Shusha and Tiflis; saddlery at Sukhum-kaleh and Ochemchiri on the Black Sea and at Temir-khan-shura in Dagestan; and copper work at Derbent and Alexandropol. But industries of every description were most seriously crippled by the spirit of turbulence and disorder which manifested itself throughout Transcaucasia in the years 1904-1906, accentuated as they were further by the outbreak of the long-rooted racial enmities between the Armenians and the Tatars, especially at Baku in 1905.

Commerce.—The exports through the Black Sea ports of Batum, Poti and Novo-rossiysk average in value a little over £10,000,000 annually, though showing a tendency to increase slightly. By far the most important commodity is petroleum, fully one-half of the total value. In addition large quantities are shipped at Baku direct for the Volga and the Transcaucasian port of Krasnovodsk. The export that comes next in value is silk, and after it may be named wheat, barley, manganese ore, maize, wool, oilcask, carpets, rye, oats, lใหญerice and timber. The import trade reaches nothing like the same value, and what there is is confined almost entirely to Batum. The annual average value may be put at not quite £5,000,000, machinery and tin-plate being a long way the most important items. There is further a small coast trade through Transcaucasia from Persia to the value of less than half a million sterling annually, and the carpets, cocoons and silk, wool, rice and boxwood; and further a sea-borne trade between Persia and Caucasian ports (Baku and Petrovsk) to the value of over £1 million sterling in all. The very extensive internal trade with Russia can only be mentioned.

Railways.—The principal approach to Caucasus from Russia by rail is the line that runs from Rostov-on-Don to Vladikavkaz at the foot of the central Caucasus range. Thence, or rather from the junction of Bzosti, 14 m. north of Vladikavkaz, the main line proceeds east of Petrovsk on the Caspian, and from Petrovsk skirts the shore southwards as far as Baku, the distance from Vladikavkaz to Baku being 244 m. This railway, together with the driving roads over the Caucasian mountains via the Mamison pass (the Ossetian military road) and the Darial pass (the Georgian military road), and the route across the Black Sea to Poti or Batumi, forms the chief means of communication between southern Russia and Transcaucasia. Baku and Batum (also Poti) are connected by another main line, 560 m. long, which traverses the valleys of the Kura and the Rion, south of the Caucasus. From Tiflis, nearly midway on this last line, a railway proceeds south as far as Erivan (543 m.), with a branch to Kars (28 m.). The Erivan line is being continued into Persia, namely, to Tabriz via Julfa on the Aras.

History.—To the ancient Greeks Caucasus, and the mighty range which dominates it, were a region of mystery and romance. It was there that they placed the scene of the sufferings of Prometheus (vide Aeschylus, Prometheus Vinctus), and there, in the land of Colchis, which corresponds to the valley of the Rion, that they sent the Argonauts to fetch the golden fleece. Outside the domain of myth, the earliest connexion of the Greeks with that part of the world would appear to have been through the maritime colonies, such as Dioscurias, which the Milesians founded on the Black Sea coast in the 7th century B.C. For more than two thousand years the most powerful state in Caucasus was that of Georgia (q.v.), the authentic history of which begins with its submission to Alexander the Great in 323 B.C. The southern portion of Transcaucasia fell during the 1st century B.C. under the sway of Armenia, and with that country passed under the dominion of Rome, and so eventually of the Eastern empire. During the 3rd century A.D. Georgia and Armenia were invaded and in great part occupied by the Khazars, and then for more than a thousand years the mountain fastnesses of this borderland between Europe and Asia were the refuge, or the resting-place, of successive waves of migration, as people after people and tribe after tribe was compelled to give way to the pressure of stronger races hammering them in the rear. The Huns, for instance, and the Avars appeared in the 6th century, and the Mongols in the 13th. In the 10th century bands of Varangians or Russified Scandinavians sailed out of the Volga and coasted along the Caspian until they had doubled the Apschern peninsula, when they landed and captured Barda, the chief town of Caucasian Albania.

But, apart from Georgia, historical interest in Caucasus centres in the long and persistent attempts which the Russians made to conquer it, and the heroic, though unavailing, resistance offered by the mountain races, more especially the Circassian and Lesghian tribes. Russian aggression began somewhat early in the 18th century, when Peter the Great, establishing his base at Astrakhan on the Volga, and using the Caspian for bringing up supplies and munitions of war, captured Derbent from the Persians in 1722, and Baku in the following year. But these conquests, with others made at the expense of Persia, were restored to the latter power after Peter's death, a dozen years later. At that period the Georgians were divided into various petty principalities, the chief of which were Imeretia and Georgia (Kharthlia), owing at times a more or less shadowy allegiance to the sultan of the Ottoman Turks at Constantinople. In 1770, during the course of a war between Russia and Turkey, the Russians crossed over the Caucasus and assisted the Imeretians to resist the Turks, and from the time of the ensuing peace of Kuchuk-Kainarji the Georgian principalities looked to their southern, northern neighbour as their protector against the southern aggressors the Turks. In 1783 George XIII., prince of Georgia and Mingrelia, formally put himself under the suzerainty of Russia, and after his death Georgia was converted (1801) into a Russian province. The same fate overtook Imeretia nine years later. Meanwhile the Russians had also subdued the Ossetes (1802) and the Lesghian tribes (1803) of the middle Caucasus. By the peace of Gulistan in 1813 Persia ceded to Russia several districts in eastern Caucasus, from Lenkoran northwards to Derbent. Nevertheless the mountain tribes who inhabited the higher parts of the Caucasus were still independent, and their subjugation cost Russia a sustained effort of thirty years, during the course of which her military commanders were more than once brought almost to the point of despair by the tenacity, the devotion and the adroitness and daring which the mountaineers displayed in a harassing guerilla warfare. The animating spirit of their resistance was Shamyol (Samuel), a chief of the Dagestani Lesghians, who, a Mahomedan, proclaimed a "holy war" against the "infidel" aggressors. At first the Russians were able to continue their policy of conquest and annexation without serious check. After acquiring the northern edge of the Armenian plateau, partly from Persia in 1828 and partly from Turkey in 1829, Russia crushed a rising which had broken out in the Caspian coast districts of Dagestan on the north of the Caucasus. This took place during the years 1831-1832. The next seven years were occupied with the subjugation of the Abkhazians along the Black Sea coast, and of other Circassian tribes in the west. Meanwhile Shamyol had roused the Lesghian tribes farther east and begun his twenty years' struggle for freedom, a struggle which called forth the sympathy and admiration of nearly the whole of Europe. More than once he escaped, in a manner that seemed little short of marvellous, out of the hands of the Russians when they held him closely invested in some mountain fastness, as at Himry in 1831, at Akhulgo in 1839, and again at the same stronghold in 1849.
The general who at last broke the back of the long opposition of the prophet-chief of the Lezgians was Prince Banyaitsky, who after three years of strenuous warfare succeeded in capturing Shamyl's stronghold of Weden, and then in surrounding that chieftain himself on the inaccessible rocky platform of Gunib in the heart of Daghestan. There the hitherto indomitable champion of Caucasian independence was forced to surrender to the Russians on the 6th of September 1859. Nevertheless the spirit of resistance in these stubborn mountaineers was not finally broken until 1864, when the Russians eventually stifled all opposition in the difficult valleys and gles of the western Caucasus. But this was followed, during the next fourteen years, by the wholesale emigration of thousands upon thousands of Circassians, who sought an asylum in Turkish territory, leaving their native region almost uninhabited and desolate, a condition from which it has not recovered even at the present day. During the Russo-Turkish War of 1877-78 the self-exiled Circassians and other Caucasian mountaineers, supported by a force of 14,000 Turks, made a determined attempt to wrest their native glens from the power of Russia; but, after suffering a severe defeat at the hands of General Alkazov, the Turks withdrew, and were replaced by some 30,000 Akhbasians, who settled in Asia Minor. A few months later the Lezgians in Daghestan, who had risen in revolt, were defeated and their country once more reduced to obedience. By the ensuing peace of Adrianople, Russia still further enlarged her Transcaucasian territories by the acquisition of the districts of Kars, Batum and Ardahan. After a peaceful period of a quarter of a century the Armenian subjects of Russia in Transcaucasia were filled with bitterness and discontent by the confiscation of the properties of their national (Gregorian) church by the Russian treasury. Nor were their feelings more than half allayed by the arrangement which made their ecclesiastics salaried officers of the Russian state. This ferment of unrest, which was provoked in the years 1903-1904, was exacerbated in the winters that followed by the renewed outbreak of the century-long racial feud between the Tatars and the Armenians at Baku and other places. In fact, nearly the whole of the region between the Caucasus and the Persian-Turkish frontier on the south, from the Caspian Sea on the one side to the Black Sea on the other, was embroiled in a civil war of the most sanguinary and ruthless character, the inveterate racial animosities of the combatants being in both cases inflamed by religious fanaticism. Complete anarchy prevailed at the worst centres of disorder, as Baku and Batum, the imperial authorities being more powerless to preserve even the semblance of order than they were in the interior of Russia. Many of the oil wells at Baku were burned, and massacres took place at that town, at Shusha, at Erivan, at Tiflis, at Batum, at Jebraill and at other places. An end was put to these disorders only by the mutual agreement of the two contestants, alike horrified and exhausted by the fierce outbreak of passion, in September 1905.

CAUCASUS, a mountain range of Asia, wholly within the Russian empire, stretching north-west to south-east from the Strait of Kerch (between the Black Sea and Sea of Azov) to the Caspian Sea, over a length of 700 m., with a breadth varying from 40 to 200 m. In its general character and configuration the Caucasus presents a closer analogy with the Pyrenees than with the Alps. Its general uniformity of direction, its comparatively narrow width, and its well-defined limits towards both south and north are all features which it has in common with the former. The range of the Caucasus, like that of the Pyrenees, maintains for considerable distances a high average elevation, and is not cleft by deep trenches, forming natural passes across the range, such as are common in the Alps. In both ranges, too, some of the highest summits stand on spurs of the main range, not on the main range itself; as Mont Perdu and Maladetta lie south of the main backbone of the Pyrenees, so Mount Elbruz and Kasbek, Dykh-tau, Koshhtan-tau, Janga-tau and Shikara—all amongst the loftiest peaks of the Caucasus—stand on a subsidiary range north of the principal range or on spurs connecting the two. On the other hand, it is interesting to compare the arrangement of the drainage waters of the Caucasus with those of the Alps. In both orographical systems the principal rivers start nearly all together from a central nucleus, and in both cases they radiate to opposite quarters of the compass; but whereas in the Alps the Rhone and the Rhine, flowing south-west and north-east respectively, follow longitudinal valleys, and the Aar and the Ticino, flowing north-west and south-east respectively, follow transverse valleys, in the Caucasus the streams which flow south-west and north-east, namely, the headwaters of the Rion and the Terek, travel along transverse valleys, and those of the Kura and the Kuban, flowing south-east and north-west respectively, traverse longitudinal valleys. For purposes of description it is convenient to consider the range in four sections, a western, a middle with two subsections, and an eastern.

1. Western Caucasus. This section, extending from the Strait of Kerch to Mount Elbruz in 42° 40' E., is over 420 m. long, and runs parallel to the north-east coast of the Black Sea and at only a short distance from it. Between the main range and the sea there intervene at least two parallel ranges separated by deep glens, and behind it a third subsidiary parallel range, likewise separated by a deep trough-like valley, and known as the Bokovoi Khrebet. All these ranges are clothed through transversely by numerous glens and gorges, and, the rainfall being heavy and the exposure favourable, they are densely clothed with vegetation. Many of the spurs or broken segments of ranges thus formed abut steeply upon the Black Sea, so that this littoral region is on the whole very rugged and not readily accessible, especially as the general elevations are considerable. The seaward flanking ranges run up to 4000 ft. and more, and in many places shoot out cliffs which overhang the coast some 2000-3000 ft. sheer, while the main range gradually ascends to 10,000-12,000 ft. as it advances eastwards, the principal peaks being Fisht (8040 ft.), Oshten (9210 ft.), Shuguz (10,640 ft.), and Psyzh (12,425 ft.). And whereas the main range is built up of hard eruptive or crystalline rocks, the subsidiary chains are composed of softer (Cretaceous and Tertiary) laminated formations, which easily became disintegrated and dislocated. The snow-line runs here at about 9000 ft. on the loftiest summits, and east of Oshten the crest of the main range is capped with perpetual snow and carries many hanging glaciers, while larger glaciers creep down the principal valleys. The passes lie at relatively great altitudes and are few in number, so that although the northern versants of the various ranges all have a tolerably gentle slope, communication between the Black Sea and the valley of the Kuban, and the low steppe country beyond, is the reverse of easy. The more important passes, proceeding from west to east, are Pshek (5435 ft.) west of Oshten, and Shetlib (6600 ft.) east of Oshten, Pseashka (6880 ft.) east of Shuguz, Sanchar (7990 ft.) west of Psyzh; and between the last-named mountain and Elbruz, facilitating communication between Sukhum-Kaleh (and the coast as far as Poti) and the upper valley of the Kuban, are the passes of Marukh (11,500 ft.), Klukhor (9450 ft.) and Nakhur (9615 ft.).

Flora.—The southern exposure of this littoral region, the shelter afforded against the bitter winds of the north by the lofty Caucasus range, and the copious rainfall all combine to foster a vegetation rich and abundant vegetation. A distinguishing feature of the flora of this region is the predominance of arborescent growths; forests cover in fact 56% of the area, and are not only dense but laced together with climbing and twining plants. The commonest species of trees are such as grow in central Europe, namely, ash, fir, pine, beech, acacia, maple, birch, box, chestnut, laurel, holm-oak, poplar, elm, lime, yew, elder, willow, oak. The common box is especially prevalent, but the preponderating species are Coniferous, including the Caucasian species Pinus halepensis and P. insignis. The commonest firs are Abies nordmanniana and A. orientalis. There are two native oaks, Quercus pontica and Q. sessiliflora. A great variety of shrubs grow on these slopes of the western Caucasus, chiefly the following species, several of which are indigenous—Rhododendron ponticum, Asaalea pontica, Astrotelia maqui, Agave...

</table>

The crest of the main range runs continuously at an altitude exceeding 10,000 ft., but even it is surpassed by the eastern spine of the range, the Bokovoi Khebrei. These two ranges are connected by more than half a dozen short transverse spurs or peaks, inclining as many circular or high calbours. Besides the Bokovoi Khebrei several other subsidiary ranges branch off from the main range at acute angles, rising high up montane glaciers between them; for instance, the two ranges in Svanetia, which divide, the one the river (glen) Isgr from the river (glen) Tskenhis-Tskhi and the other the river (glen) Tskenis-Tskhi from the rivers (glen) Lekimkhum and Racha. Down all these glaciers streams descend, until they find an opportunity to pierce through the flanking ranges, which are smooth and picturesque gorges, and then race down the northern slopes of the mountains to enter the Terek or the Kuban, or down the southern versant to join the Rion or the Kura. Amongst all these high glaciers there is a remarkable absence of lakes and waterfalls; nor are there down in the lower valleys at the foot of the mountains, as one would naturally expect in a region so extensively glaciated, any sheets of water corresponding to the Swiss lakes. In this section of the Caucasus the loftiest peaks do not
CAUCASUS

as a rule rise on the main range, but in many cases on the short spurs that link it with the Bokovoi Khrebet and other subsidiary
ranges.

The central chain of the Caucasus," writes Mr Douglas W.
Freshfield, 1 consists of a number of short parallel or curved horsethrough the gorges, the watershed being transferred to the parallel
chain of clay slates... which has followed it from the Black Sea,
attaining on its way the height of 13,400 ft. in the Lails, and limiting
the great parallel basins of the Rion, Ingur and Skenis Shali
(=the Tsys-Takhali). 2 At the base of the central range some
chain spread (to the north) broad, smooth, grayish downs, the pastures
of the Turk and the Ossete... Their ridges attain to 9000 to
10,000 ft. They are composed of friable crystalline schists...
Beyond these horistic ridges a broken wall of limestone, cleft to the
base by gorges, through which flow the mountain torrents, and
clapped by pale precipitous battlements, which face the central
chain at a height of 11,000 to 12,000 ft. Beyond, again, lies a broad
fallow, or 'longitudinal fold,' as geologists call it; parallel to the
ridges of the northern range. It is the last of the parallel
ranges, on which, here and there among the waves of beech forest,
purple or blue with distance, a white cliff retains its local color
and shines like a patch of fresh snow. Beyond, once more beyond,
spreads the Scythian steppe, but the dead level of 6000 ft., but
an expanse of long low modulations, which would be reckoned
hills in our home counties, wooded by long shining ribbons, which mark
the courses of the tributaries of the Terek... Southwards too,
immense fields, covered with shrubs, are the smooth gray,
grassy heights, separated by shallow trenches, which form the lesser
undulations of the three basins, the three Langenkohlteller Inseritons
of Dr Radde. These basins or 'longitudinal folds' are enclosed on the
northern side by the high ridges, and in the south by the
parallel to the crystalline chain main chain from the neighbourhood
of Sukhum-Kale to the Krestovaya Gora [pass of Darial]. Behind
this slaty crest spreads a confused multitude of hills, Jurassic and
Cretaceous in their formation. Their outer edges, which are some
30 to 40 m. from the snows, is marked by a limestone belt, lower
and less continuous than that on the north, which frames the
gorges of the Rion, and rises in the Kuamil (6352 ft.) and Nakara (4774 ft.)
near the southern border of the Terek range, and more
breathtaking are the parallel ranges, and the southern slopes
are clothed with vegetation of remarkable luxuriance and
richness, more especially in the region of Svanetia (45° 45'E).
Not only are the plants bigger than they grow in the Alps, but
the blossoms are more abundant. Here again forests of Coniferous
predominate, especially on the northern and eastern slopes;
and the other distinguishing features of the flora are gigantic
male ferns (Aspidium filix-mas), Picea incompleta (a member of the
Trilliacese), Ussoriae tree-moss, box, holly (Ilex aquifolium),
Lilium monadelphum and many of the familiar herbaceous
plants which flower in English gardens, though here they grow
in an altogether extraordinary size... "monkswoods, Cephalaria,
Mugledia and groundels, among which men on horseback might
play at hide and seek without stopping" (E. Levier). Other
prominent species are Comppanula, Pyraramus, aconite, Cephalis,
Speedwell, Alchemilla serica, Cenusarea macrophala, Primula
grandis and a species of primrose. And the great height (13000 ft.)
at which the flowering plants blossom is not less remarkable
than the great beauty and abundance of the flowers. Species
which grow on both the northern and the southern slopes
ascend to 6000 ft. higher on the Terek range than formerly.
Walnuts grow up to an altitude of 5400 ft., the vine and mulberry up
to 3350 ft., the lime and ash to 4000 ft. The forests extend to
the upper edge of the limestone gorges. Above that the crystalline
schists are bare of tree vegetation. The upper limit of arborescent
vegetation is considered to run at 7000-7500 ft., of shrubs such as
rhododendrons at 8500 ft., and of pasture-lands up to 9000 ft.
The principal cultivated varieties of plants in this section are
wheat, rice, oats, barley, beans, millet and tobacco.

1 Exploration of the Caucasus (2nd ed., 1902), i. 30-31.
2 Op. cit. i. 35-36.
the Baba-dagh in 48° 25' E., a distance of 230 m., the Caucasus attains its greatest breadth. For the whole of that distance the main range keeps at an average elevation of 10,000 ft., though the peaks in many instances tower up 2000 to nearly 5000 ft. higher, the altitudes increasing towards the east. As the main range approaches the Caspian its granite core gradually disappears, giving place to Palaeozoic schists, which spread down both the northern and the southern slopes. The glaciers too decrease in the same proportion both in magnitude and in extent. Here the principal peaks, again found for the most part on the spurs and subsidiary ranges, are the Tsmiakom-khokh (13,570 ft.), Shan-tau (14,530 ft.), Kidenais-magali (13,840 ft.), Zigla-khokh (12,645 ft.), Zikari (12,565 ft.), Choukhi (12,110 ft.), Julti-dagh (12,430 ft.), Alakhan-dagh (12,600 ft.) and Maghi-dagh (12,445 ft.). On the main range itself stand Borbalo (10,175 ft.), Great Shavi-kildesh (12,325 ft.), Murov (11,110 ft.), Ansal (11,740 ft.), Ginor-roslo (11,120 ft.), while farther east come Trfan-dagh (13,765 ft.) and Bazarduz or Kichen (14,727 ft.). In the same direction, but a little to the north, is the range, and sinks down both eastwards to the Black Sea and northwards to the valley of the Terek. On the north-west this rugged highland range is well defined by the distinctive transverse ridge of Andi, which to the east of Kasbek strikes off from the Caucasus range almost at right angles. The rest of the Daghestan consists of a series of roughly parallel folds, of Jurassic or Cretaceous age, ranging in altitudes from 7500 up to 12,500 ft., separated from one another by deep gorge-like river gorges which cut it up into a number of arid, treeless plateaus which have something of the appearance of independent ranges, or rather elongated tablelands of a mountainous character. The most prominent of these tablelands is Bash-lam, which stretches east and west between the Chantli Argun and the Andian Kosiu, both tributaries of the Terek. Upon it rise the conspicuous peaks of Tefubos-mta (14,775 ft.), Tugo-mta (13,795 ft.), Komito-sti or Kachu (14,410 ft.), Donos-mta (13,560 ft.), Diklos-mta or Koles-mta (13,680 ft.), Motshokh-tseri (13,440 ft.) and Galavans-tseri (13,260 ft.). Farther east come the Bogos tableland, stretching from south-west to south-east, and the Andian Kosiu and the Avarian Kosiu and rising to over 13,400 ft. in several peaks, e.g. Antshovala (13,420 ft.), Botshokh-meht (13,515 ft.), Kosara-ku (13,420 ft.) and Addala-shugochol-mesht (13,580 ft.); and the Duko tableland, reaching 12,400 ft. between the Kara Kosiu and the Kazikumukh Kosiu. On some of these peaks there is again a considerable lowering of glaciers, particularly on the slopes of Diklos-mta, where the glaciers descend to 7700 ft. on the north side and to 8530 ft. on the south side. In this section of the Caucasus the passes run somewhat lower than those between Elbruz and Kasbek, though still at appreciable heights, fully equal to those that lead up from the Black Sea to the valley of the Kuban in the western section of the range. The best known are the Krestovaya Gora (7805 ft.) on the Georgian military road, south of Daria; Kodor (9230 ft.) and Sabat-black, leading up from Tbilis in the upper valley of the Alazan; and Gundar (10,120 ft.) and Salavart (9280 ft.), carrying the Akhty military road from the valley of the Samur up past the Shah-dagh and the Bazar-dyusi to the valley of the Alazan.

The flora of this section bears a general resemblance to that farther west. Ample details will be found in Dr G. Radde's (1831-1903) monographs on Daghestan, quoted at the end of the present article.

4. The Eastern Section of the Caucasus gradually dies away east of Bbba-dagh (11,930 ft.) towards the Caspian, terminating finally in the peninsula of Apsheron. It is, however, continued under the waters of the Caspian, as stated in the article on that sea, and reappears on its eastern side in the Kopet-dagh, which skirts the north-east frontier of Persia. In this section of the Caucasus the peak exceeds 9000 ft. in altitude and the crest of the main range retains no snow. The most frequented pass, that of Alty-agash, necessitates a climb of not more than 4155 ft.

Slopes of Range.—Between the northern and the southern sides of the range there is quite as great a difference in climate, productions and scenery as there is between the Swiss and the Italian sides of the Alps. In the south-western valleys and on the south-western slopes of the Caucasus, where a heavy rainfall is combined with a warm temperature, magnificent forests clothe the mountain-sides and dip their skirts into the waters of the Black Sea. There not only the littoral from (say) Sukhum-Kaleh to Batum but the inland parts of the basin of the Rion will bear comparison with any of the provinces of Italy in point of fertility, and in richness and variety of products. But farther inland, upon proceeding eastwards towards Tiflis, a great change becomes noticeable on the other side of the transverse ridge of the Suram or Meskes mountains. Arid-land plains and parched hill-sides take the place of the rich verdure and luxuriant arborescent growth of Imetria, Svanetia and Mingrelia, the districts which occupy the valleys of the Ingur and Rion and the southern limits of the Meskes. A very similar change likewise comes noticeable in the higher regions of the Caucasus Mountains upon proceeding north of the pass of Mamison, which separates the head-waters of the Rion from those of the Ardon, an important tributary of the Terek. The valleys of the two streams last mentioned, and of others that flow in the same direction, are almost wholly destitute of trees, but where the bare rock does not prevail, the mountain slopes are carpeted with grass. Freshfield's description of the valley of the Terek above Kasbek will apply pretty generally to all the valleys that descend on that face of the range: ‘treeless valleys, bold rocks, slopes of forbidding steepness (even to eyes accustomed to those of the Alps), and stone-built villages, scarcely distinguishable from the neighbouring crags.' But, austere and unaccompanied though these valleys are, the same epithets cannot be applied to the deep gorges by which in most cases the streams make their escape through the northern subsidiary range. These defiles are declared to be superior in grandeur to anything of the kind in the Alps. That of Darial (the Terek) is fairly well known, but those of the Cherek and the Urukhi, farther west, are stated to be still more magnificent. And not only do the snow-clad ranges and the ice-pounded peaks which tower up above them surpass the loftiest summits of the Alps in altitude; they also in many cases excel them in boldness and picturesque quality of outline, and equal the most difficult of them in steepness and relative inaccessibility.

Hydrography.—Nearly all the larger rivers of Caucasus have their sources in the central parts of the Caucasus range. The steep, torrential streams of Mdzimta, Pzou, Bzyb and Kodor drain the country west of Elbruz. The Ingur, Tscheni-Tskhal, Rion and its tributaries (e.g. the Kvirila) are longer, but also in part torrental; they drain the great glacier region between Elbruz and Kasbek. The Rion is the Phasis of the ancients and flows through the classic land of Colchis, associated with the legends of Medea and the Argonauts. The Lyakhta and Aragva, tributaries of the Kura, carry off the waters of the main range south of Kasbek, and other tributaries, such as the Vkin and the Alazan, collect the surplus drainage of the main Caucasus range farther east. The other larger rivers of this region, the Aras, has its sources, not in the Caucasus range, but on the Armenian highlands a long way south-west of Ararat. The rivers which go down from the central Caucasus northwards have considerably longer courses than those on the south side of the range, partly as a consequence of the gentler versant and partly also because of the great distances to which the steppes extend across which they make their way to the sea. The most important of these are the Kuban and the Terek; but it is the latter that picks up most of the streams which have their sources among the central glaciers, e.g. the Malka, Baksan, Chegem, Cherek, Urukhi, Ardon, all confined to deep narrow gulls until they quit the mountains. The Kuma, which alone pursues an independent course through the steppes, farther north than the
Terek, has its sources, not in the main ranges of the Caucasus, but in an outlying group of mountains near Pyatigorsk, the highest summit of which, Besh-tau, does not exceed 4600 ft. But its waters become absorbed in the sands of the desert steppes before they reach the Caspian. Of the streams that carve into chasers the elevated plateau or highland region of Daghestan four are known by the common name of the Koisu, being distinguished inter se as the Andian Koisu, the Avarian Koisu, the Kara Koisu and the Kazikumuk Koisu, which all unite to form the Sulak. The only other stream deserving of mention in this province is the Samur. Both rivers discharge their waters into the Caspian; as also does the Zumbail, a small stream which drains the eastern extremity of the Caucasus range in the government of Baku.

Volcanic Evidences.—Ancient, but now extinct, volcanic upheavals are pretty common at the intersections of the main range with the transverse ranges; of these the most noteworthy are Elbruz and Kasbek. The town of Shemakha, near the eastern end of the system, was the scene of volcanic outbursts as late as 1870, 1872 and 1902; while in the adjacent peninsula of Apsheron mud volcanoes exist in large numbers. All along the northern foot of the system hot mineral springs gush out at various places, such as Pyatigorsk, Zhelesnovodsk, Essentuki and Kislovodsk; and the series is continued along the northeastern foot of the highlands of Daghestan, e.g. Isti-su, Eskinderdy, Akhta. In this connexion it may also be mentioned that similar evidences of volcanic activity characterize the northern border of the Armenian highlands on the southern side of the Rion-Kura depression, in the mountains of Ararat, Alagöz, Akマンagan, Samsar, Godoreby, Great and Little Abult, and in the mineral springs of Borzhom, Abbas-tuman, Slepctov, Mikhailovsk and Tiflis.

Geology.—The general structure of the Caucasus is comparatively simple. The strata are folded so as to form a fan. In the centre of the fan lies a band of crystalline rocks which disappears towards the east. Beneath it, on both sides, plunge the strongly folded Palaeozoic and Jurassic schists. On the northern flank the folded beds are followed by a zone of Jurassic and Cretaceous beds which rapidly assume a gentle inclination towards the plain. On the south the corresponding zone is affected by numerous secondary folds which involve the Sarmatian or Upper Miocene deposits. In the eastern part of the chain the structure is somewhat modified. The crystalline band is lost. The northern Mesozoic zone is very much broader, and is thrown into simple folds like those of the Jura. The southern Mesozoic zone is absent, and the Palaeozoic zone sinks abruptly in a series of faulted steps to the plain of the Kura, beneath which no doubt the continuation of the Mesozoic zone is concealed.

The geological sequence begins with the granite and schists of the central zone, which form a band extending from Fisht on the west to a point some distance beyond Kasbek on the east. Then follow the Palaeozoic schists and slates. Fossils are extremely rare in these beds; *Bolithophis* has long been known, and doubtful traces of *Calemites* and ferns have been found, but it was not until 1897 that undoubted Palaeozoic fossils were obtained. They appear to indicate a Devonian age. Upon the Palaeozoic beds rest a series of Mesozoic deposits, beginning with the Lias and ending with the Upper Cretaceous. Whether the series is continuous or not is a matter of controversy. F. Loewinson-Lessing states that there is a more or less marked discordance between the Lias and the Upper Jurassic and between the latter and the Cretaceous; E. Fourniere asserts that there exists a very strongly marked unconformity at the base of the Tithonian, and other writers have expressed other views. In general the Upper Jurassic beds are much more calcareous on the north flank of the chain than they are on the south. The Mesozoic beds are followed by the Tertiary deposits, which on the north are nearly horizontal but on the south are in part included in the folds—the Eocene and Miocene being folded, while the later beds, though sometimes elevated, are not affected by the folding. The final folding of the chain undoubtedly occurred at the close of the Miocene period. That there were earlier periods of folding is almost equally certain, but there is considerable difference of opinion as to their dates. The difference in character of the Jurassic beds on the two sides of the chain appears to indicate that a ridge existed in that period. The last phase in the history of the Caucasus was marked by the growth of the great volcanoes of Elbruz and Kasbek, which stand upon the old rocks of the central zone, and by the outflow of sheets of lava upon the sides of the chain. The cones themselves are composed largely of acid anodesite, but many of the lavas are augite anodesites and basalts. There seem to have been two periods of eruption, and as some of the lavas have flowed over Quaternary gravels, the latest outbursts must have been of very recent date.

Near the northern foot of the Caucasus, especially in the neighbourhood of the hot mineral springs of Pyatigorsk, a group of hills of igneous rocks rises above the plain. They are laticolites of trachytes, and raised the Tertiary beds above them in the form of blisters. Subsequent denudation has removed the sedimentary covering and exposed the igneous core.

Bibliography.—Of the older works the following are still useful: A. von Hartkauz, Transkaukasien (2 vols., Leipzig, 1846); A. Petzold, Der Kaukasus (2 vols., Leipzig, 1866-1867); W. von Thielmann, Reise im Kaukasus, 2 vols., London, 1875); F. C. Grove, The Proty Caucasian (London, 1875); R. Rade, Reisen im mongolischen Hochgebirge (Tiflis, 1886) and Vier Vornöge über den Kasbek (Gotha, 1874); E. Fawer, Recherches géologiques dans la partie centrale de la chaîne du Caucase (Geneve, 1873); Batsevich, Simonovich and others, Mas. diya geologicky Kaukas (Tiflis, 1873 seq.); O. Schneider, Naturwissenschaftliche Beitraegen zur Kenntnis der Kaukasusländer (Dresden, 1879), and J. Bryce, Transcaucasia (London, 1878). The more important amongst the more recent books are D. W. Freshfield, Exploration of the Caucasus (2nd ed., 1902, 2 vols., London; A. F. Mummery, My Climbs in the Alps and Caucasus (London, 1895); H. Abich, Geologische Forschungen in den kaukasischen Ländern (2 vols., Vienna, 1878-1878). Aus kaukasischen Ländern (2 vols., Vienna, 1896), and "Ver gleichende Grundriss des Kaukasus wie der armenischen und nordpersischen Gebirge," in Mém. Acad. St. Pétersb. (sér. 6, 1893, 1894).
CAUCHOIS-LEMAIRE—CAUCHY 555

M. G. of the English, the scale of 1 : 210,000 (ed. 1895-1901).

CAUCHOIS-LEMAIRE, LOUIS FRANCOIS AUGUSTE (1789-1861), French journalist, was born in Paris on the 28th of August 1789. Towards the end of the First Empire he was proprietor of the *Journal de la littérature et des arts*, which his former at the Restoration into a political journal of Liberal tendencies, the *Naïon jaune*, in which Louis XVIII. himself had little satirical articles secretly inserted. After the return from Elba the *Naïon jaune* became Bonapartist and fell into discredit. It was suppressed at the second Restoration. Cauchois-Lemaire then threw himself impetuously into the Liberal agitation, and had to take refuge in Brussels in 1816, and in the following year in the Hague, whence he was expelled for publishing an *Appel à l'opinion publique et aux États Généraux en faveur des principes nationaux*. Returning to France in 1819, he resumed the struggle against the ultra-royalist party with success, and that year was admitted to the *Académie des Sciences*.

Having went there, he published only the first volume (1842), which contains a historical summary of the Restoration and a preliminary sketch of the democratic movement. He died in Paris on the 9th of August 1861.

CAUCHE, PIERRE (d. 1442), French bishop, was born near Reims in the latter half of the 14th century. We find him rector of the university of Paris in October 1397, when he joined the Burgundian faction, and was elected by the parlement of Paris on the triumph of his party this decree was annulled, and Philip the Good, duke of Burgundy, gave him a canonry at Beauvais, sent him to the council of Constance, procured him the post of maître des roguettes in 1418, and finally in 1420 had him made bishop of Beauvais. But the people were hostile to him, and he was driven from his bishopric in 1429; whereupon he attached himself to the English court, and in 1431 endeavoured to procure the surrender of Reims to the English, so that Henry VI. might be crowned there. In this he failed, and Henry was crowned in Paris on the 17th of December 1431 by Henry Beaufort, cardinal bishop of Winchester, assisted by the bishops of Beauvais and Noyon. On the 24th of May 1430, Joan of Arc having been taken prisoner at Compiegne, within the limits of his diocese, Cauché acted as her accuser, and demanded the right of judging her. Joan was taken to Rouen, whither Cauché followed her, having been driven from Beauvais. He conducted the trial with marked partiality and malevolence, condemned the maid to imprisonment for life, and then, under pressure from the populace and the English, had recourse to fresh perjuries, declared Joan a relapsed heretic, excommunicated her, and handed her over to the secular arm on the 30th of May 1431. As, in consequence of this, it was impossible for him to return to his own diocese, he obtained the bishopric of Lisieux in 1432 by favour of the king of England. He assisted at the council of Basel in 1435, and died suddenly on the 18th of December 1442. Excommunicated posthumously by Pope Calixtus IV., his body was exhumed and thrown in the common sewer.

CAUCHY, AUGUSTIN LOUIS, BARON (1789-1857), French mathematician, was born at Paris on the 21st of August 1789, and died at Sceaux (Seine) on the 23rd of May 1857. Having engaged in a military career, he went to Paris to enter the École Polytechnique, where he was attached to the class of mathematics. In this class he was taught by Pierre Frédéric Cauchy (1760-1848), who held several minor public appointments and counted Lagrange and Laplace among his friends, Cauchy entered École Centrale du Panthéon in 1802, and proceeded to the École Polytechnique in 1805, and to the École des Ponts et Chaussées in 1807. Having adopted the profession of an engineer, he left Paris for Cherbourg in 1810, but returned in 1813 on account of his health, whereupon Lagrange and Laplace persuaded him to renounce engineering and to devote himself to mathematics. He obtained an appointment at the École Polytechnique, which, however, he relinquished in 1830 on the accession of Louis Philippe, finding it impossible to take the necessary oath. A short sojourn at Freiburg in Switzerland was followed by his appointment in 1831 to the newly-created chair of mathematical physics at the university of Turin. In 1833 the deposed king Charles X. summoned him to be tutor to his grandson, the duke of Bordeaux, an appointment which enabled Cauchy to travel and thereby become acquainted with the favourable impression which his investigations had made. Having renewed his old attachment to the École Polytechnique, Cauchy returned to Paris in 1838, he refused a proffered chair at the Collège de France, but in 1848, the oath having been suspended, he resumed his post at the École Polytechnique, and when the oath was re-instituted after the coup d'état of 1851, Cauchy and Arago were exempted from it. A profound mathematician, Cauchy exercised by his perspicacious and rigorous methods a great influence over his contemporaries and successors. His writings cover the entire range of mathematics and mathematical physics.

Cauchy had two brothers: Alexandre Laurent (1792-1857), who became a president of a division of the court of appeal in 1847, and a judge of the court of cassation in 1849; and Eugène François (1820-1877), a publicist who also wrote several mathematical works.

The genius of Cauchy was promised in his simple solution of the method of elimination of Bézout, i.e. to describe a circle touching three given circles, which he discovered in 1805, his generalization of Euler's theorem on polyhedra in 1811, and in several other elegant problems. More important is his memoir on wave-propagation which obtained the Grand Prize of the Académie des Sciences in 1820, and in which the whole of his subsequent researches in mathematical science are enveloped in the rigorous methods which he introduced. These are mainly embodied in his three great treatises, *Cours d'analyse de l'École Polytechnique* (1821); *Le Calcul infinitésimal* (1825); *Leçons sur les applications du calcul intégral à la détermination des lignes géodésiques* (1828-1830), and also in his courses of mechanics (for the École Polytechnique), higher algebra (for the Faculté de Sciences), and of mathematical physics (for the Collège de France). His treatises and contributions to scientific journals (to the number of 780) contain investigations on the theory of series (where he developed with perspicuous skill the notion of convergence), on the theory of numbers and complex quantities, the theory of groups and
substitutions, the theory of functions, differential equations and

determinants. He clarified the principles of the calculus by developing

them with the aid of limits and continuity, and was the first
to prove Taylor's theorem rigorously, establishing his well-known
form of the remainder. In mechanics, he made many researches,
substituting the notion of the continuity of geometrical displace-
ments for the principle of the continuity of matter. In optics, he
developed the wave theory, and his name is associated with the simple

dispersion formula. In elasticity, he originated the theory of stress,
and his results are nearly as valuable as those of S. D. Poisson.

His collected works, Oeuvres complètes d'Augustin Cauchy, have been
published in 27 volumes.

See A. Vaillot, Le Baron Augustin Cauchy: sa vie et ses travaux
(Paris, 1868).

CAUCUS, a political term used in America of a special form
of party meeting, and in Great Britain of a system of party

organization. The word originated in Boston, Massachusetts,
in the early part of the 18th century, when it was used as the
name of a political club, the "Caucus" or "Caucas" club. Here
public matters were discussed, and arrangements made for
local elections and the choosing of candidates for offices.

The first mention of the club in contemporary documents occurs
in the diary of John Adams in 1763, but William Gordon (History
of the Independence of the United States of America, 1788) speaks
of the Caucus as having been in existence some fifty years before
the time of writing (1774), and describes the methods used for
securing the election of the candidates the club had selected.

The derivation of the word has been much disputed. It was
perhaps derived from the Greek kaukos, a cup, and it was supposed
referred to meetings of the caulkers in the dockyard at Boston
in 1770, to protest against the action of the British troops, or

with a contemptuous allusion to the lower class of workmen
frequenting the club. This is, however, a mere guess, and does
not agree with the earlier date at which the club is known to have
existed, nor with the accounts given of it. That it was a fanciful
name for a convivial club, derived from the late Greek
caukos, a cup, is far-fetched, and the most plausible origin is an
Algonquian word kaw-kaw-wis, meaning to talk. Indian
words and names have been popular in America as titles for
societies and clubs; cf. "Tammamy" (see Notes and Queries,
sixth series, vols. xi. and xii.). In the United States "caucus"
is used strictly of a meeting either of party managers or of party

voters. Such might be a "nominating caucus," either for
nominating candidates for offices or for selecting delegates for
a nominating convention.

The caucus of the party in Congress nominated the candidates for the offices of president and vice-president from 1800 until 1824, when the convention system was adopted, and the place of the local "nominating caucuses," taken by the "primaries" and conventions. The word is used in
America of the meetings of a party in Congress and other
legislative bodies and elsewhere which decide matters of policy
and plan campaigns. 

"Caucus" came first into use in Great Britain in 1878. The Liberal Association of Birmingham (see Liberal Party) was organized by Mr. Joseph Chamberlain and Mr. F. Schnadorst on
strict disciplinary lines, more particularly with a view to election management and the control of voters on the principle of "vote as you are told." This managing body of the association, known locally as the "Six Hundred," became
the model for other Liberal associations throughout the country,
and the Federation of Liberal Associations was organized on the
same plan. It was to this supposed imitation of the American political "machine" that Lord Beaconsfield gave the name "caucus," and the name came to be used, not in the American
sense of a meeting, but of a closely disciplined system of party
organization, chiefly used as a stock term of abuse applied by
opponents of the party machinery.

CAUDEBEC-EN-CAUX, a town of France, in the department
of Seine-Inférieure, 27 m. W.N.W. of Rouen by the Ouest-Ètat
railway. Pop. (1906) 21,481. It is situated on the right bank of
the Seine, the tidal wave of which (mascaret) can be well seen at
this point. The chief interest of the town lies in its church, a
building of the 15th and the early 16th centuries. Round its
top run balustrades formed of Gothic letters, which read as part of
the Magnificat. Its west portal, the decoration of the spire of
the tower, and its stained glass are among the features which
make it one of the finest churches of the Rouen diocese. The
town also possesses several old houses. Its industries include
nailing and leather-currying, and there is trade in grain. The
port has a small trade in coal, live-stock and farm produce.

CAUDINE FORKS (Furcula Caudinae), a pass in Samnium,
famous for the disaster which befell the Roman army in the
second Samnite War (321 B.C.). Livy (ix. 2) describes it as
formed by two narrow wooded gorges, between which lay a plain,
grassy and well-watered, but entirely enclosed by mountains.

Through this plain the road (later the Via Appia) led. The
Romans, marching from Calatia to the relief of Luceria, entered
the valley unopposed, but found the exit blocked by the enemy,
flushing the road they saw that the entrance and the hills
surrounding the plain were also occupied, and there was no way
of escape. The plain which lies west of Caudium (Montesarchio)
seems, despite the older views, to be the only possible site for
such a disaster to an army of as many as 40,000 men; and there
is no doubt that the Romans wished to leave it by the defile on
the east, through which later ran the Via Appia to Beneventum.

The existence of three ancient bridges on the line of the modern
road renders it impossible to suppose that its course can be
essentially different from that of the ancient, though Hülsen
and Moiano, in their work on the two valleys, show that the two
divisions of the river, after passing Montesarchio, there are,
however, two possible routes; one, the one on the north
side of the river, via Moiano, and one on the west by Arpaia; the former
seems to answer better to Livy's description (via alio per caum rum),
while the latter is the shortest route, having been, later on,
followed by the Via Appia, and bore the name Furculae Caudinae
in the middle ages.

See C. Hülsen in Pauly-Wissowa, Realencyclopädie, iii. (1902).

(C. A. S.)

CAUL, (from O. Eng. colle, Fr. cole, a cap), a close-fitting
woman's cap, especially one made of network worn in the 16th
and 17th centuries; hence the membranous covering to the
heart or brain, the omentum, or the similar covering to the
intestines, and particularly, a portion of the omentum, which
is sometimes found remaining round the head of a child after
birth. This, called in Scotland "selly how," holy or lucky
hood, many superstitions have been attached; it was looked on as
a sign of good luck, and when preserved, was kept as a protection
against多年前

CAULAINCOURT, ARMAND AUGUSTIN LOUIS, MARQUIS
DE (1773-1827), French general and diplomatist, was born of
a noble family. He early entered the army, did not emigrate in
the revolution, but was deprived of his grade as captain in 1793
and served in the ranks. In 1795, through the protection of
L. Hoche, he became captain again, was colonel in the Army of
the Rhine in 1796-1800, and after the peace of Lunéville (1801)
was sent to St Petersburg to negotiate an understanding between
Russia and France. On his return he was named aide-de-camp of
the First Consul. He was employed to seize some agents of the
English government in Baden in 1804, which led to the accusa-
tion that he was concerned in the arrest of the duc d'Enghien,
an accusation against which he never ceased to protest. After
the establishment of the empire he received various honours and
the title of duke of Vicenza (1808). Napoleon sent him in 1807 as
ambassador to St Petersburg, where Caulaincourt tried to
maintain the alliance of Tilsit, and although Napoleon's ambition
made the task a difficult one, Caulaincourt succeeded in it for
some years. In 1811 he strongly advised Napoleon on the
success of his proposed expedition to Russia. During the war he accom-
panied the emperor, and was one of those whom Napoleon took
along with him when he suddenly abandoned his army in Poland
in return to Paris (December 1812). During the last years of
the empire, Caulaincourt was charged with all the diplomatic
negotiations. He signed the armistice of Pleswitz, June 1813,
represented France at the congress of Prague, in August 1813, at
the congress of Chatillon, in February 1814, and concluded the

treaty of Fontainebleau on the 10th of April 1814. During the first Restoration, Caulaincourt lived in obscure retirement. When Napoleon returned from Elba, he became minister of foreign affairs and tried to persuade Europe of his peaceful intentions. After the second Restoration, Caulaincourt's name was on the list of those proscribed, but it was erased on the personal intervention of Alexander I, with Louis XVIII.

Caulaincourt's memoirs appeared under the title Souvenirs du duc de Vincennes in 1837-1840. See A. Vandel, Napoleon et Alexandre (Paris, 1891-1893); Tatischeff, Alexandre Ier et Napoleon (Paris, 1892); H. Houssaye, 1814 (Paris, 1888), and 1815 (Paris, 1893).

**CAULUS** (from Lat. *caulis*, a stalk), in architecture, the stalks (eight in number) with two leaves from which rise the helices or spiral scrolls of the Corinthian capital to support the abacus.

**CAULON** (Gr. *Kaulonivioi*), a town of the district of the Bruttii, Italy, on the east coast. Its exact site is uncertain (though the name has been given to a modern village), and depends on the identification of the river Sagras. It was the southernmost of the Achaean colonies, founded either by Croton or direct from Greece itself. In the 7th century it was allied with Croton and Sybaris, and its coins, which go back to 530 B.C., prove its importance. It took the side of Athens in the Peloponnesian War. In 388 B.C. it was destroyed by Dionysius, but soon afterwards restored. It was captured during the invasion of Pyrrhus by Campanian troops in 275 B.C. It is also known as Caulus. The precincts of the lighthouse at Capo Stilo, on the site of one of the medieval guard towers of the coast, led to the discovery of a wall of Greek origin, and close by of a number of terra-cottas, belonging perhaps to a temple erected in honour of the deities of the sea. Other remains were found at Fontanelle, 21 m. away, including the fragment of a capital of an archaic Greek temple (P. Orsi in *Notizie degli Scavi*, 1851, 61). These buildings may be connected with the Caulon or a village dependent on it. (T. As.)

**CAUSATION** or **CAUSALITY** (Lat. *causae*, derived perhaps from the root *kata*- as in *caveo*, and meaning something taken care of; corresponding to Gr. *airia*), a philosophical term for the operation of causes and for the mental conception of cause as operative throughout the universe. The word "cause" is correlative to "effect." Thus when one thing B is regarded as taking place in consequence of the action of another thing A, then A is said to be the cause of B, and B the effect of A. The philosophical problems connected with causation are both metaphysical and psychological. The metaphysical problem is part of the whole theory of existence. If everything is to be regarded as causally related with simultaneous and prior things or actions, it follows logically that the investigation of existence must, by hypothesis, be a regress to infinity, i.e. that we cannot conceive a beginning to existence. This explanation has led to the postulate of a First Cause, the nature of which is variously explained. The empirical school sees no difficulty in assuming a single event; but such a theory seems to deny the validity of the original hypothesis. Theologians assert a divine origin in the form of a personal self-existent creator, while some metaphysical schools, preferring an impersonal First Cause, substitute the doctrine of the Absolute (*q.v.*). All the explanations are alike in this respect, that at a certain point they pass from the sphere of the senses, the physical world, to a metaphysical sphere in which the data and the intellectual operation of cognizing them are of a totally different quality. For example, the causal connexion between drunkenness and alcohol is not of the same observable character as that which is inferred from the infinite First Cause and the whole domain of sense-given phenomena.

A second metaphysical problem connected with causation arises when we consider the nature of necessity. It is generally assumed when two things are spoken of as cause and effect that their relation is a necessary one, or, in other words, that given the cause the effect must follow. The arguments connected with this problem belong to psychological discussions of causation. It is sufficient here to state that, in so far as causation is regarded as necessary connexion, it can form no part of a purely empirical theory of existence. The senses can say only that in all observed cases B has followed A, and this does not establish necessary connexion. The idea of causation is a purely intellectual (a priori) one.

The psychological problems connected with causation refer (1) to the origin of the conception in our minds; (2) to the validity of the conception. As regards the origin of the conception modern psychological analysis does not carry us beyond the doctrine of Locke contained in his chapter on "Power" (Essay, bk. ii. ch. 21), wherein he shows that the idea of power is got from the knowledge of our own activity. "Bodies by their causes," he says, "do not afford us so clear and distinct an idea of active power as we have from reflection on the operation of our minds." Putting Locke's doctrine into modern language, we may say that a man has the conception of cause primarily because he himself is a cause. The conception thus obtained we "project," that is, transfer to external objects, so far as we may find it useful to do so. Thus it is by a sort of analogy that we say that the sun is the "cause" of daylight. The rival theory to Locke's is that of Hume (Treatise, bk. i.), who derives the conception from the unaided operation of custom. When one object, A, has been noticed frequently to precede another object, B, an association between A and B is generated; and by virtue of this association, according to Hume, we say that A is the cause of B. The weakness of this account is that many invariable successions, such as day and night, do not make us regard the earlier members of the succession as causing the later; while in numberless cases we assert a causal connexion between two objects from a single experience of them.

We may proceed now to consider the validity of the conception of causation, which has been attacked from two sides. From the side of absolute idealism it is argued that the conception of cause, as involving a transition in time, cannot be ultimately valid, since the time-relation is not ultimately real. Upon this view (ably stated in Professor Bosanquet's *Logic*, bk. i. ch. 6) the more we know of causes and effects the less relevant becomes the time-relation and the nearer does the conception of cause and effect approach to another conception which is truly valid, the conception of ground and consequence. This means that, viewed from the standpoint of science, a draught of alcohol causes intoxication in no other sense than the triangularity of a triangle causes the interior angles to be equal to two right angles. This argument ceases to have cogency so soon as we deny its fundamental proposition that the time-relation is not ultimately real, but is irrelevant from the standpoint of science. This is a sheer assertion, contrary to all ordinary experience, which we have as much right to deny as the absolute idealists to assert. It is only plausible to those who are committed to the Hegelian view of reality as consisting of a static system of universals, a view which has long been discredited in Germany, its native land, and is fast losing ground in England. Against the Hegelians we must maintain that the common distinction between "ground" and "cause" is perfectly justifiable. Whereas "ground" is an appropriate term for the relations within a static, simultaneous system, "cause" is appropriate to the relations within a dynamic, successive system.

From the other side the validity of causation has been attacked in the interests of the naturalism of the mechanical sciences. J. S. Mill argues that, scientifically, the cause of anything is the total assemblage of the conditions that precede its appearance, and that we have no right to give the name of cause to one of them exclusively of the others. The answer to this is that Mill fails to recognize that cause is a conception which we find useful in our dealings with nature, and that whatever conceptions we find useful we are justified in using. Among the conditions of an event there are always one or two that stand in specially close relation to it from our point of view; e.g. the draught of alcoholic liquor is more closely related to the man's drunkenness than is the attraction of the earth's gravity, though that also must co-operate in producing the effect. Such closely related conditions we find it convenient to single out by a term which expresses their analogy to the cause of causes, human volition.
These are the questions respecting causation which are matters of present controversy; there are in addition many other points which belong to the same class. Considering the most important are Aristotle's classification of causes into material, formal, efficient and final, set forth in his *Physics* and elsewhere, and known as his doctrine of the Four Causes; Leibnitz's law of Sufficient Reason; and Kant's explanation of cause and effect as an a priori category of the understanding, intended as an answer to Hume's scepticism, but very much less effective than the line of explanation suggested by Locke.

The following is a list of the various technical terms connected with causation which have been distinguished by logicians and psychologists.

The four Aristotelian causes are: (1) *Material cause* (*causa* materiae), the material out of which a thing is made; the material cause of a house is the bricks and mortar of which it is composed. (2) *Formal cause* (*causa* formae), the general external appearance, shape, form of a thing; the formal cause of a triangle is its triangularity. (3) *Efficient cause* (*causa* efficiens), the alcohol which makes a man drunk, the pistol-bullet which kills. This is the cause as generally understood in modern usage. (4) *Final cause* (*causa* finis), the object for which an action is done or a thing produced; the final cause of a commercial man's enterprise is to make his livelihood (see *Teleology*). This last cause was rejected by Bacon, Descartes and Spinoza, and indeed in ordinary usage the cause of an action in relation to its effect is the desire for, and expectation of, that effect on the part of the agent, not the effect itself. The *Proximate cause* of a phenomenon is the immediate or superficial as opposed to the *Remote or Primary cause*. Plurality of Causes is the much criticized doctrine of J. S. Mill that a fact may be the uniform consequent of different antecedents. *Causa essendi* means the cause whereby a change is what it is, as opposed to the *causa cogitandi*: the cause of light, the edge of the water, etc.; such causes evidently need not be the same for every object; is called *causa immanens* when it produces its changes by its own activity; a *causa transiens* produces changes in some other object. *Causa sui* is a term applied to God by Spinoza to denote that he is independent on nothing and has no need of any external thing for his existence. *Vera causa* is a term used by Newton in his *Principia*, where he says, "No more causes of natural things are to be admitted than such as are both true and sufficient to explain the phenomena of those things"; *verae causae* must be such as we have good inductive grounds to believe do exist in nature, and do perform a part in phenomena analogous to those to which we would render an account of.

**CAUSEWAY**, a path on a raised dam or mound across marshes or low-lying ground; the word is also used of old paved highways, such as the Roman military roads. "Causey" is still used dialectically in England for a paved or cobbled footpath. The word is properly "causeway," from Old French *cause*, a bank or dam, which is derived, through the Norman-French *causc* (cf. modern *caussette*), from the late Latin *via calcaria*, a road stamped firm with the feet (*calcare*, to tread).

**CAUSES** (from Lat. *cursus*), through local Fr. *caus*, meaning "line"), the name given to the table-lands lying to the south of the central plateau of France and sloping westward from the Cévennes. They form parts of the departments of Lozère, Aveyron, Gard, Hérault, Lot and Tarn-et-Garonne. They are of limestone formation, dry, sterile and treeless. These characteristics are most marked in the east of the region, where the Causee de Sauveterre, the Causee Méjan, the Causee Noir and the Larzac flank the Cévennes. Here the Causee Méjan, the most deserted and arid of all, reaches an altitude of nearly 4,200 ft. Towards the west the lesser causes of Rouergue and Quercy attains respectively 3,950 ft. and 1,470 ft. Once an uninterrupted table-land, the causes are now isolated from one another by deep rills through which run the Tarn, the Dourbie, the Jonte and other rivers. The summits are destitute of running water, since the rain as it falls either sinks through the permeable surface soil or runs into the fissures and chasms, some of great depth, which are peculiar to the region. The inhabitants (*Causenards*) of the higher causes cultivate hollows in the ground which are protected from the violent winds, and the scanty herbage permits of the raising of sheep, from the milk of which Roquefort cheeses are made. In the west, where the rigours of the weather are less severe, agriculture is more easily carried on.

**CAUSIN DE PERCEVAL, ARMAND-PIERRE** (1705-1871), French orientalist, was born in Paris on the 13th of January 1705. His father, Jean Jacques Antoine Causin de Perceval (1759-1835), was professor of Arabic in the Collège de France. In 1814 he went to Constantinople as a student interpreter, and afterwards travelled in Asiatic Turkey, spending a year with the Maronites in the Lebanon, and finally becoming dragoman at Aleppo. Returning to Paris, he became professor of vulgar Arabic in the school of living oriental languages in 1821, and also professor of Arabic in the Collège de France in 1833. In 1849 he was elected to the Academy of Inscriptions. He died at Paris during the siege on the 15th of January 1871.

**CAUSIS DE PERCIVAL** published in 1858 a useful *Grammaire arabe vulgaire*, which passed through several editions (4th ed., 1868), and edited and enlarged Élie Bocchor's *Dictionnaire français-arabe* (2 vols., 1828; 3rd ed., 1864); but his great reputation rests almost entirely on one book, the *Essai sur l'histoire des Arabes avant l'islamisme*, pendant *Vépoque de Mahomet* (3 vols., 1847-1849), in which the native traditions as to the early history of the Arabs, down to the death of Mohammed and the complete subjection of all the tribes to Islam, are brought together with wonderful industry and set forth with much learning and lucidity. One of the principal MS. sources used is the great *Kitâb al-Aghâni* (Book of Songs) of Abu Faraj, which has since been published (20 vols., Bouak, 1868) in Egypt; but no publication of texts can deprive the *Essai*, which is now very rare, of its value as a trustworthy guide through a tangled mass of tradition.

In optics, the term *caustic* is given to the envelope of luminous rays after reflection or refraction; in the first case the envelope is termed a catacaustic, in the second a diacaustic. Catacaustics are to be observed as bright curves when light is allowed to fall upon a polished riband of steel, such as a watch-spring, placed on a table, and by varying the form of the spring and moving the source of light, a variety of patterns may be obtained. The investigation of caustics, being based on the assumption of the rectilinear propagation of light, and the validity of the experimental laws of reflection and refraction, is essentially a geometrical, and as such it attracted the attention of the mathematicians of the 17th and succeeding centuries, more notably John Bernoulli, G. F. de l'Hôpital, E. W. Tachirnour and Louis Carre.

The simplest case of a caustic curve is when the reflecting surface is a circle, and the luminous rays emanate from a point on the circumference. If in fig. 4 aabP is the reflecting circle, aQ is a ray from a point P on the circumference, while bO is the incident ray, and a joins Q along the law of the equality of the angles of incidence and reflection, that the reflected ray QR is such that the angles QRC and CQP are equal; then clearly the envelope of the curve produced by the action of the rays is determined by the envelope of this line. This may be readily accomplished geographically or analytically, and it will be found that the envelope is a cardioid (q.v.), i.e. an epitrochoid in which the radii of the fixed and rolling circles are equal. When the rays are parallel, the reflecting surface opposite.
remaining circular, the question can be similarly treated, and it is found that the caustic is an epicycloid in which the radius of the fixed circle is twice that of the rolling circle (fig. 2). The geometrical method is also applicable when it is required to determine the caustic

\[
\frac{a}{a - \alpha} = \frac{c}{c - \alpha}
\]

FIG. 1.

after any number of reflections at a spherical surface of rays, which are either parallel or diverge from a point on the circumference. In both cases the curves are epicycloids; in the first case the radii of the rolling and the fixed circles are \(a(2m+1)\) and \(a\), and in the second, \(a(2m+1)\) and \(a(2m+1)\), where \(a\) is the radius of the mirror and \(m\) the number of reflections.

The Cartesian equation to the caustic produced by reflection at a circle of rays diverging from a point is given by Joseph Louis Lagrange; it may be expressed in the form

\[
[(4e^2-a^2)(e^2+a^2)-2a^2x-e^2a^2]\cos \theta = 2a^2y^2+e^2a^2-x^2-a^2e^2
\]

where \(a\) is the radius of the reflecting circle, and \(c\) the distance of the luminous point from the centre of the circle. The polar form is

\[
(u+v)\cos \theta + (u-v)\sin \theta = (2k)^2
\]

where \(u\) and \(v\) are the reciprocals of \(c\) and \(a\), and \(u\) the reciprocal of the radius vector of any point on the caustic. When \(c:a\), or when the curve reduces to the cut-off or the two cuspid epicycloid previously discussed. Other

forms are shown in figs. 3, 4, 5, 6. These curves were traced by the Rev. Hammet Holditch (Quart. Jour. Math., vol. 1). Secondary caustics are orthogonals having the reflected or refracted rays as normals, and consequently the proper caustic curve, being the envelope of the normals, is their evolute. It is usually the case that the secondary caustic is easier to determine than the caustic, and hence, when determined, it affords a ready means for deducing the primary caustic. It may be shown by geometrical considerations that the secondary caustic is a curve similar to the first positive pedal of the reflecting curve, of twice the linear dimensions, with respect to the luminous point. For a circle, when the rays emanate from any point, the secondary caustic is an ellipse, and hence the primary caustic is the evolute of this curve.

The simplest instance of a caustic by refraction (or diacaustic) is when luminous rays issuing from a point are refracted at a straight line. It may be shown geometrically that the secondary caustic, if the second medium be less refractive than the first, is an ellipse having the luminous point for a focus, and its centre at the foot of the perpendicular from the luminous point to the refracting line. The evolute of this ellipse is the caustic required. If the second medium be more highly refractive than the first, the secondary caustic is a hyperbola having the same focus and centre as before, and the caustic is the envelope of this curve. When the refracting curve is a circle and the rays emanate from any point, the locus of the secondary caustic is a Cartesian oval, and the evolute of this curve is the required dia-caustic. These curves appear to have been first discussed by Gergonne. For the caustic by refraction of parallel rays at a circle reference should be made to the memoirs by Arthur Cayley.

References.—Arthur Cayley's "Memoirs on Caustics" in the Phil. Trans. for 1857, vol. 147, and 1867, vol. 157, are especially to be consulted. Reference may also be made to R. S. Heath's Geometrical Optics and R. A. Herman's Geometrical Optics (1900).

CAUTERETS, a watering-place of south-western France in the department of Hautes-Pyrénées, 20 m. S. by W. of Lourdes by rail. Pop. (1906) 1030. It lies in the beautiful valley of the Gave de Cauterets, and is well known for its copious thermal springs. They are chiefly characterized by the presence of sulphur and silicate of soda, and are used in the treatment of diseases of the respiratory organs, rheumatism, skin diseases and many other maladies. Their temperature varies between 75° and 135° F. The springs number twenty-four, and there are nine bathing establishments. Cauterets is a centre for excursions, the Monné (8035 ft.), the Caballos (7655 ft.), the Pic de Chabarrat (9550 ft.), the Vignemal (10,820 ft.), and other summits being in its neighbourhood.

CAUTIN, a province of southern Chile, bounded N. by Araraco, Malleco and Bio-Bio, E. by Argentina, S. by Valdivia, and W. by the Pacific. Its area is officially estimated at 5832 sq. m. Cautin lies within the temperate agricultural and forest region of the south, and produces wheat, cattle, lumber, tan-bark and fruit. The state central railway from Santiago to Puerto Montt crosses the province from north to south, and the Cautin, or Imperial, and Tolten rivers (the latter forming its southern boundary) cross from east to west, both affording excellent transportation facilities. The province once formed part of the territory occupied by the Araucanian Indians, and its present political existence dates from 1857. Its population (1905) was 68,750, of whom a large percentage were Eucotam in the principle of Germanic. The capital is Temuco, on the Rio Cautin; Pop. (1895) 7078. The principal towns besides Temuco are Lautaro (3130) and Nueva Imperial (2719), both of historic interest because they were fortified Spanish outposts in the long struggle with the Araucanians.

CAUTLEY, SIR PROBY THOMAS (1802-1871), English engineer and palaeontologist, was born in Suffolk in 1802. After some years' service in the Bengal artillery, which he joined in 1819, he was engaged on the reconstruction of the Doab canal, of which, after it was opened, he had charge for twelve years (1831-1843). In 1840 he reported on the proposed Ganges canal, for the irrigation of the country between the rivers Ganges, Hindan and Jumna, which was his most important work. This project was sanctioned in 1841, but the work was not begun till 1843, and even then Cautley found himself hampered in its return by the opposition of Lord Ellenborough. From 1843 to 1848 he was absent in England owing to ill-health, and on his return to India he was appointed director of canals in the North-Western Provinces. After the Ganges canal was completed in 1854 he went back to England, where he was made K.C.B., and in 1858 he occupied a seat on the council of India. He died at Sydenham, near London, on the 29th of January 1871. In 1860 he published a full account of the making of the Ganges canal, and he also contributed numerous memoirs, some written in collaboration with Dr Hugh Falconer, to the Proceedings of the Bengal Asiatic Society and the Geological Society of London on the geology and fossil remains of the Sivalik Hills.

CAUVERY, or Kaveri, a river of southern India. Rising in Coorg, high up amid the Western Ghats, in 12° 25' N. lat. and 75° 34' E. long., it flows with a general south-eastern direction across the plateau of Mysore, and finally pours itself into the Bay of Bengal through two principal mouths in Tanjore district. Its total length is 477 m., the estimated area of its basin 27,700 sq. m. The course of the river in Coorg is very tortuous. Its bed is generally rocky; its banks are high and covered with luxuriant vegetation. On entering Mysore it passes through a narrow gorge, but presently widens to an average breadth of 300 to 400 yds. Its bed continues rocky, so as to forbid all navigation; but its banks are abundantly supplied with a rich strip of cultivation. Its course through Mysore the channel is interrupted by twelve anicutas, or dams for the purpose of irrigation. From the most important of these, known as the Madadka, an artificial channel is led to a distance of 77 m., irrigating an area of 10,000 acres, and ultimately bringing a water-supply into the town of Mysore. In Mysore the Cauvery forms the two islands of Seringapatam and Sivasamudram, which vie in sanctity with the island of Seringam lower down in Trichinopoly district. Around the island of Sivasamudram are the celebrated falls of the Cauvery, unrivalled for romantic beauty. The river here branches into two channels, each of which makes a descent of about 200 m.
in a succession of rapids and broken cascades. After entering the Madras presidency, the Cauvery forms the boundary between the Coimbatore and Salem districts, until it strikes into Trichinopoly district. Sweeping past the historic rock of Trichinopoly, it breaks at the island of Seringam into two channels, which enclose between them the delta of Tanjore, the garden of southern India. The northern channel is called the Coleroon (Kolidam); the other preserves the name of Cauvery. On the seaward face of its delta are the open roadsteads of Negapatam and French Karikal. The only navigation on any portion of its course is carried on in boats of basket-work. It is in the delta that the real value of the river for irrigation becomes conspicuous. This is the largest delta system, and the most profitable of all the works in India.

The most ancient irrigation work is a massive dam of unhewn stone, 1080 ft. long, and from 40 to 60 ft. broad, across the stream of the Cauvery proper, which is supposed to date back to the 4th century, is still in excellent repair, and has supplied a model to British engineers. The area of the ancient system was 669,000 acres, the modern about 1,000,000 acres. The chief modern work is the anicut across the Coleroon, 2250 ft. long, constructed by Sir Arthur Cotton between 1836 and 1838. The Cauvery Falls have been utilized for an electric installation, which supplies power to the Kolar gold-mines and the light to the city of Mysore.

The Cauvery is known to devote Hindus as Dakshini Ganga, or the Ganges of the south, and the whole of its course is holy ground. According to the legend there was once born upon earth a girl named Vishnumaya or Lopamudra, the daughter of Brahma; but her divine father permitted her to be regarded as the child of a mortal, called Kava-muni. In order to obtain beatitude for her adoptive father, she resolved to become a river whose waters should purify from all sin. Hence it is that even the holy Ganges resorts underground once in the year to the source of the Cauvery, to purge herself from the pollution contracted from the crowd of sinners that have bathed in her waters.

CAVA DEI TIRRENI—CAVAIGNAC

CAVA DEI TIRRENI, a town and episcopal see of Campania, Italy, in the province of Salerno, 6 m. N.W. by rail from the town of Salerno. Pop. (1901) town, 7611; commune, 23,415. It lies fairly high in a richly cultivated valley, surrounded by wooded hills, and is a favourite resort of foreigners in spring and summer, and of the Knapsacks in winter. A mile to the south-west of the town is the village of Corpo di Cava (1970 ft.), with the Benedictine abbey of La Trinité della Cava, founded in 1025 by St. Alferius. The church and the greater part of the buildings were entirely modernized in 1796. The old Gothic cloisters are preserved. The church contains a fine organ and several ancient sarcophagi. The archives, now national property, include documents and MSS. of great value (e.g. the Codex Legum Longobardorum of 1004) and fine incunabula. The abbot is keeper, and also head of a boarding school.

See M. Morcaldi, Codex Diplomaticus Cauensis (Naples and Milan, 1873-1893).

CAVAEIUM, in architecture, the Latin name for the central hall or court within a Roman house, of which five species are described by Vitruvius. (1) The Tuscanicum responds to the greater number apparently of those at Pompeii, in which the timbers of the roof are framed together, so as to leave an open space in the centre, known as the compluvium; it was through this opening that all the light was received, not only in the hall itself, but in the rooms round. The rain from the roof was collected in gutters round the compluvium, and discharged from thence into a tank or open basin in the floor called the impluvium. (2) In the tetrasylon additional support was required in consequence of the dimensions of the hall; this was given by columns placed at the four angles of the impluvium. (3) Corinthian is the term given to the species where additional columns were required. (4) In the displuvium the roofs, instead of sloping down towards the compluvium, sloped outwardly, the gutters being on the outer walls; there was still an opening in the roof, and an impluvium to catch the rain falling through. This species of roof, Vitruvius states, is constantly in want of repair, as the water does not easily run away, owing to the stoppage in the rain-water pipes. (5) The testudinatum was employed when the hall was small and another floor was built over it; no example of this type has been found at Pompeii, and only one of the cavaedum displuvium.

CAVAGNARI, SIR PIERRE LOUIS NAPOLEON (1841-1879), British military administrator, the son of a French general by his marriage with an Irish lady, was born at Stenay, in the department of the Meuse, on the 4th of July 1841. He nevertheless obtained naturalization as an Englishman, and entered the military service of the East India Company. After passing through the college at Addiscombe, he served through the Oudh campaign against the mutineers in 1858 and 1859. In 1861 he was appointed an assistant commissioner in the Punjab, and in 1877 became deputy commissioner of Peshawar and took part in several expeditions against the hill tribes. In 1878 he was attached to the staff of the British mission to Kabul, which the Afghans refused to allow to proceed. In May 1879, after the death of the amir Shere Ali, Cavagnari negotiated and signed the treaty of Gandamak with his successor, Yakub Khan. By this the Afghans agreed to admit a British resident at Kabul, and the post was conferred on Cavagnari, who also received the Star of India and was made K.C.I.E. He returned to England in July 1879 for a time, all seemed to go well, but on the 3rd of September Cavagnari and the other European members of the mission were massacred in a sudden rising of mutinous Afghan troops. (See AFGHANISTAN.)

CAVAIGNAC, JEAN BAPTISTE (1762-1829), French politician, was born at Gourdon (Lot). He was sent by his department as deputy to the Convention, where he associated himself with the party of the Mountain and voted for the death of Louis XVI. He was constantly employed on missions in the provinces, and distinguished himself by his rigorous repression of opponents of the revolution in the departments of Landes, Basses-Pyrénées and Gers. With his colleague Jacques Pinet (1754-1844) he established at Bayonne a revolutionary tribunal with authority in the neighbouring towns. Charges of cruelty were preferred against him by a local society before the Convention in 1795, but were dismissed. He had represented the Convention in the armies of Brest and of the Eastern Pyrenees in 1793, and in 1795 he was sent to the armies of the Moselle and the Rhine. He filled various minor administrative offices, and in 1816 came to France at the end of the Napoleonic wars, to a small commune in the department of the Seine. During the Hundred Days he was prefect of the Somme. At the restoration he was proscribed as a regicide, and spent the last years of his life at Brussels, where he died on the 24th of March 1829. His second son was General Eugène Cavaignac (q.v.).

The eldest son, ÉLÉONORE LOUIS GODFROI CAVAIGNAC (1801-1845), was, like his father, a republican of the intransigent type. He was bitterly disappointed at the triumph of the monarchical principle after the revolution of July 1830, in which he had taken part. He took part in the Parisian risings of October 1830, 1832 and 1834. On the third occasion he was imprisoned, but escaped to England in 1835. When he returned to France in 1841 he worked on the staff of La Réforme, and carried on an energetic republican propaganda. In 1843 he became president of the Society of the Rights of Man, of which he had been one of the founders in 1832. He died on the 5th of May 1845. The reburied statue (1847) of Godfroi Cavaignac on his tomb at Montmartre (Paris) is one of the masterpieces of the sculptor François Rude.

Jean Baptiste’s brother, JACQUES-MAURICE, VICOMTE CAVAIGNAC (1773-1855), French general, served with distinction in the army under the republic and successive governments. He commanded the cavalry of the XI. Corps in the retreat from Moscow, and eventually became Vicomte Cavaignac and inspector-general of cavalry.

CAVAIGNAC, LOUIS EUGÈNE (1802-1857), French general, son of J. B. Cavaignac, was born at Paris on the 15th of October 1802. After going through the usual course of study for the military profession, he entered the army as an engineer officer in 1824, and served in the Moros in 1828, becoming captain in the following year. When the revolution of 1830 broke out
he was stationed at Arras, and was the first officer of his regiment to declare for the new order of things. In 1831 he was removed from active duty in consequence of his declared republicanism, but in 1832 he was recalled to the service and sent to Algeria.

This continued to be the main sphere of his activity for sixteen years, and he won especial distinction in his fifteen months' command of the exposed garrison of Tlemcen, a command for which he was selected by Marshal Clausel (1836-1837), and in the defence of Cherchel (1840). Almost every step of his promotion was gained on the field of battle, and in 1844 the d'Aumale himself asked for Cavaignac's promotion to the rank of marshal de camp. This was made in the same year, and he held various district commands in Algeria up to 1848, when the provisional government appointed him governor-general of the province with the rank of general of division. The post of minister of war was also offered to Cavaignac, but he refused it owing to the unwillingness of the government to quarter troops in Paris, a measure which the general held to be necessary for the stability of the new régime. On his election to the National Assembly, however, Cavaignac returned to Paris. When he arrived on the 17th of May he found the capital in an extremely critical state. Several days before he already had taken place, and by the 26th of June 1848 a formidable insurrection had been organized. The only course now open to the National Assembly was to assert its authority by force. Cavaignac, first as minister of war and then as dictator, was called to the task of suppressing the revolt. It was no light task, as the national guard was untrustworthy, regular troops were not at hand in sufficient numbers, and the insurgents had abundant time to prepare themselves. Various estimates at from 30,000 to 60,000 men, well armed and organized, they had entrenched themselves at every step behind formidable barricades, and were ready to avail themselves of every advantage that ferocity and despair could suggest to them. Cavaignac failed perhaps to appreciate the political exigencies of the moment; as a soldier he would not strike his blow until his plans were matured and his forces sufficiently prepared. When the troops at last advanced in three strong columns, every inch of ground was disputed, and the government troops were frequently repulsed, till, fresh regiments arriving, he forced his way to the Place de la Bastille and crushed the insurrection in its headquarter quarter, which raged from the 26th of June to the 28th. On the 28th of June his men fought ferociously. It is said that the bloodiest and most resolute the streets of Paris have ever seen, and the general did not hesitate to inflict the severest punishment on the rebels.

Cavaignac was censured by some for having, by his delay, allowed the insurrection to gather head; but in the chamber he was declared by a unanimous vote to have deserved well of his country. After laying down his dictatorial powers, he continued to preside over the Executive Committee till the election of a regular president of the republic. It was expected that the suffrages of France would raise Cavaignac to that position. But the mass of the people, and especially the rural population, sick of revolution, and weary even of the moderate republicanism of Cavaignac, were anxious for a stable government. Against the five and a half million votes recorded for Louis Napoleon, Cavaignac received only a million and a half. Not without chagrin at his defeat, he withdrew into the ranks of the opposition. He continued to serve as a representative during the short remainder of the republic. At the coup d'état of the 2d December of 1851 Cavaignac was one of the few men who were willing to remain in the Chamber, and along with the other members of the opposition; but after a short imprisonment at Ham he was released, and, with his newly-married wife, lived in retirement till his death, which took place at Orne (Sarthe) on the 28th of October 1857.

His son, JACQUES MARIE EUGÈNE GODEFROI CAVAIGNAC (1853-1905), French politician, was born in Paris on the 21st of May 1853. He made public profession of his republican principles as a schoolboy at the Lycée Charlemagne by refusing in 1867 to receive a prize at the Sorbonne from the hand of the prince imperial. He received the military medal for the Franco-Prussian War, and in 1872 entered the École Polytechnique. He served as a civil engineer in Angoulême until 1881, when he became master of requests in the council of state. In the next year he was elected deputy for the arrondissement of Saint-Calais (Sarthe) in the republican interest. In 1885-1886 he was under-secretary for war in the Henri Brisson ministry, and he served in the cabinet of Émile Loubet (1892) as minister of marine and of the colonies. He had exchanged his moderate republicanism for radical views before he became war minister in the cabinet of Léon Bourgeois (1895-1896). He was again minister of war in the Brisson cabinet in July 1898, when he read in the chamber a document which definitely incriminated Captain Alfred Dreyfus. On the 30th of August, however, he stated that this had been discovered to be a forgery by Colonel Henry, but he refused to concur with his colleagues in a revision of the Dreyfus prosecution, which was the logical outcome of his own exposure of the forgery. Resigning his portfolio, he continued to declare his conviction of Dreyfus's guilt, and joined the Nationalist group in the chamber, of which he became one of the leaders. He also was an energetic supporter of the Ligue de la Patrie Française. In 1899 Cavaignac was an unsuccessful candidate for the presidency of the republic. He had announced his intention of retiring from political life when the Republic is restored. Cavaignac died at Paris, on the 27th of September 1905. He wrote an important book on the Formation de la Prusse contemporaine (2 vols., 1891-1898), dealing with the events of 1806-1813.

CAVAILLON, a town of south-eastern France in the department of Vaucluse, 20 m. S.E. of Avignon by rail. Pop. (1906) town, 57,560; commune, 90,522. Cavaillon lies at the southern base of Mont St Jacques on the right bank of the Durance above its confluence with the Coulon. It has a hôtel de ville of the 18th century, a church of the 12th century, dedicated to St Vérain, and the mutilated remains of a triumphal arch of the Roman period. The town is an important railway junction and the commercial centre of a rich and well-irrigated plain, which produces melons and other fruits, early vegetables (artichokes, tomatoes, celery, pâtas), and other products in profusion. Silk-worms are reared, and silk is an important article of trade. The preparation of preserved vegetables, fruits and other provisions, distilling, and the manufacture of straw hats and leather are carried on. Numerous minor relics of the Roman period are found in the town. It is the site of the ancient Cabellia, a place of some note in the territory of the Cavares. In medieval and modern history the town has for the most part followed the fortunes of the Comtat Venaissin, in which it was included. Till the time of the Revolution it was the see of a bishop, and had a large number of monastic establishments.

CAVALCANTI, GUIDO (c. 1250-1300), Italian poet and philosopher, was the son of a philosopher whom Dante, in the Inferno, condemns to torment among the Epicureans and Atheists; but he himself was a friend of the great poet. By marriage with Beatrice, daughter of Farinata Uberti, he became head of the Ghibellines; and when the people, weary of continual brawls, aroused themselves, and sought peace by banishing the leaders of the rival parties, he was sent to Sarzana, where he caught a fever, of which he died. Cavalcanti has left a number of love sonnets and canzoni, which were honoured by the praise of Dante. Some are simple and graceful, but many are spoiled by a mixture of metaphysics borrowed from Plato, Aristotle and the Christian Fathers. They are mostly in honour of a French lady, whom he calls Mandetta. His Canzone d'Amore was extremely popular, and was frequently published; and his complete poetical works are contained in Giunti's collection (Florence, 1527; Venice, 1531-1532). He also wrote in prose on philosophy and oratory.

See D. G. Rossetti, Dante and his Circle (1874).

CAVALIER, JEAN (1681-1740), the famous chief of the Camisards (q.v.), was born at Mas Roux, a small hamlet in the commune of Ribaute near Anduze (Gard), on the 28th of November 1681. His father, an illiterate peasant, had been compelled by persecution to become a Roman Catholic along
Cavalier

with his family, but his mother brought him up secretly in the Protestant faith. In his boyhood he became a shepherd, and about his twentieth year he was apprenticed to a bishop. Threatened with proscription for his Calvinist opinions, he went to Genoa, where he passed the year 1701; he returned to the Cévennes on the eve of the rebellion of the Camisards, who by the murder of the Abbé du Chayla at Pont-du-Monvent on the night of the 24th of July 1702 raised the standard of revolt. Some months later he became their leader. He showed himself possessed of an extraordinary genius for war, and Marshal Villars paid him the high compliment of saying that he was as courageous in attack as he was prudent in retreat, and that by his extraordinary knowledge of the country he displayed in the management of his troops a skill as great as that of the ablest officers. Within a period of two years he was to hold in check Count Victor Maurice de Broglie and Marshal Montrevel, generals of Louis XIV., and to carry on one of the most terrible partisan wars in French history.

He organized the Camisard forces and maintained the most severe discipline. As an orator he derived his inspiration from the prophets of Israel, and raised the enthusiasm of his rude mountaineers to a pitch so high that they were ready to die with their young leader for the sake of liberty of conscience. Each battle increased the terror of his name. On Christmas day 1702 he dared to hold a religious assembly at the very gates of Alais, and put to flight the local inhabitants which came forth to attack him. At Nages, on 10th of February 1703, he routed the royal troops, but, defeated in his turn, he was compelled to find safety in flight. But he reappeared, was again defeated at Tour de Bellot (April 20), and again recovered himself, recruits flocking to him to fill up the places of the slain. By a long series of successes he raised his reputation to the highest pitch, and gained the full confidence of the people. It was in vain that more rigorous measures were adopted against the Camisards. Cavalier boldly carried the war into the plain, made terrible reprisals, and threatened even Nimes itself. On the 16th of April 1704 he encountered Marshal Montrevel himself at the bridge of Nages, with 1000 men against 5000, and, though defeated after a desperate conflict, he made a successful retreat with two-thirds of his men. It was at this moment that Marshal Villars, wishing to put an end to the terrible struggle, opened negotiations, and Cavalier was induced to attend a conference at Pont d’Avène near Alais on the 11th of May 1704, and on the 16th of May he made submission at Nîmes. These negotiations, with the proudest monarch in Europe, he carried on, not as a rebel, but as the leader of an army which had waged an honourable war. Louis XIV. gave him a commission as colonel, which Villars presented to him personally, and a pension of 1200 livres. At the same time he authorized the formation of a Camisard regiment for service in Spain under his command.

Before leaving the Cévennes for the last time he went to Alais and to Ribaute, followed by an immense concourse of people. But Cavalier had not been able to obtain liberty of conscience, and his Camisards almost to a man broke forth in wrath against him, reproaching him for what they described as his treacherous desertion. On the 21st of June 1704, with a hundred Camisards who were still faithful to him, he departed from Nîmes and came to Neu-Brisach (Alsace), where he was to be quartered. From Dijon he went on to Paris, where Louis XIV. gave him audience and heard his explanation of the revolt of the Cévennes. Returning to Dijon, fearing to be imprisoned in the fortress of Neu-Brisach, he escaped with his troop near Montbéliard and took refuge at Lausanne. But he was too much of a soldier to abandon the career of arms. He offered his services to the duke of Savoy, and with his Camisards made war in the Val d’Aosta. After the peace he crossed to England, where he formed a regiment of refugees which took part in the Spanish expedition under the earl of Peterborough and Sir Cloudesley Shovel in May 1705. At the battle of Almanza the Camisards found themselves opposed to a French regiment, and without firing the two bodies rushed one upon the other. Cavalier wrote later (July 10, 1707): “The only consolation that remains to me is that the regiment I had the honour to command never showed back but sold its life dearly on the field of battle. I fought as long as a man stood beside me and until numbers overpowered me, losing also an immense quantity of blood from a dozen wounds which I received.” Marshal Berwick never spoke of this tragic event without visible emotion.

On his return to England a small pension was given him and he settled at Dublin, where he published Memoirs of the Wars of the Cévennes under Col. Cavalier, written in French and translated into English with a dedication to Lord Carteret (1726). Though Cavalier received, no doubt, assistance in the publication of the Memoirs, it is none the less true that he provided the materials, and that his work is the most valuable source for the history of his life. He was made a general on the 27th of October 1735, and on the 25th of May 1738 was appointed lieutenant-governor of Jersey. Writing in the following year (August 26, 1739) he says: “I am overworked and weary; I am going to take the waters in England so as to be in a fit condition for the war against the Spaniards if they reject counsels of prudence.” He was promoted to the rank of major-general on the 2nd of July 1739, and died in the following year. In the parochial register of St Luke’s, Chelsea, there is an entry: “Burial a.d. 1740, May 18, Brigadier John Cavalier.”

There is a story which represents him as the fortunate rival of Voltaire for the hand of Olympe, daughter of Madame Dunoyer, author of the Lettres galantes. During his stay in England he had the daughter of Captain de Ponthieu and Marguerite de la Rochefoucauld, refugees living at Portarlington. Malesherbes, the courageous defender of Louis XVI., bears the following eloquent testimony to this young hero of the Cévennes:—“I confess,” he says, “that this warrior, who, without ever having served, found himself by the mere gift of nature a great general,—this Camisard who was bold to punish a crime in the presence of a fierce troop which maintained itself by little crimes—this coarse peasant who, when admitted at twenty years of age into the society of cultivated people, caught their manners and won their love and esteem, this man who, though accustomed to a stormy life, and having just cause to be proud of his success, had yet enough philosophy in him by nature to enjoy for thirty-five years a tranquil private life—appears to me to be one of the rarest characters to be found in history.”

For a more detailed account see F. Paux, Vie de Jean Cavalier (1868); David C. A. Agnew, Protestant Exiles from France, ii. 54-66 (Longmans, 1871); Charvey, Jean Cavalier: sources documents bytems (1884). Eugène Sue popularized the name of the Camisard chief in Jean Cavalier ou les fantaisies des Cévennes (1840). (F. PX.)

CAVALIER, a horseman, particularly a horse-soldier or one of gentle birth trained in knightly exercises. The word is taken from one of the French words which derived ultimately from the Late Lat. caballarius, a horseman, from Lat. caballus, properly a pack-horse, which gave the Fr. cheval, a chevalier. This last word is the regular French for “knight,” and is chiefly used in English for a member of certain foreign military or other orders, particularly of the Legion of Honour. Cavalier in English was early applied in a contemptuous sense to an overbearing swashbuckler—a roisterer or swaggering gallant. In Shakespeare (2 Henry IV., v. ili. 62) Shallow calls Bardolph’s companions “cavaleros.” “Cavalier” is chiefly associated with the Royalists, the supporters of Charles I. in the struggle with the Parliament in the Great Rebellion. Here again it first appears as a term of reproach and contempt, applied by the opponents of the king. Charles in the Answer to the Petition (June 13, 1642) speaks of cavaliers as a “word by what mistake soever it seems much in disfavour.” Further quotations of the use of the word by the Parliamentary party are given in the New English Dictionary. It was soon adopted as a title of honour by the king’s party, who in return applied Roundhead to their opponents, and at the Restoration the court party preserved the name, which survived till the rise of the term Tory (see Whig and Tory). The term “cavalier” has been adopted from the French as a term in fortification for a work of great command constructed in the
interior of a fort, bastion or other defence, so as to fire over the main parapet without interfering with the fire of the latter. A greater volume of fire can thus be obtained, but the great height of the cavalier makes it an easy target for a besieger’s guns.

CAVALIÈRE—EMILIO DEL, 17th-century Italian musical composer, was born in Rome about 1550 of a noble family. He held a post at the court of Ferdinand I. of Tuscany from 1588 to 1597, and during his residence at Florence was on terms of intimacy with J. Peri, O. Rinuccini, G. Caccini and the rest of the Bardi circle. In 1597 he returned to Rome, and became connected with the Congregation of the Oratory founded by St Philip Neri. Here in 1600 was performed Cavallieri's contribution to the musical reformation initiated by his circle of friends in Florence—La Rappresentazione di Anima e di Corpo, a sacred drama, which is regarded as the first example of what is now called oratorio. It is generally supposed that he was no longer living when the work was performed, but some authors assign 1602 as the date of his death.

Cavalli's style is more facile than that of Peri and Caccini, but he is inferior to them in depth of musical expression. He is, however, important as being the first to apply the new monodic style to sacred music, and as the founder of the Roman school of the 17th century which included Mazzocchi, Carissimi and Alessandro Scarlatti.

See also H. Goldschmidt, Studien zur Geschichte der italienischen Oper im 17. Jahrhundert, Band 1.

CAVALLI, FRANCESCO (1602-1676), Italian musical composer, was born at Crema in 1599 or 1600. His real name was Pier Francesco Caletti-Bruni, but he is better known by that of Cavalli, the name of his patron, a Venetian nobleman. He became a singer at St Mark's in Venice in 1617, second organist in 1639, first organist in 1665, and in 1668 maestro di cappella. He is, however, chiefly important for his operas. He began to write for the stage in 1630 (Le Nozze di Teti e di Peleo), and soon established so great a reputation that he was summoned to Paris in 1660 to produce an opera (Serae) at the Louvre in honour of the marriage of Louis XIV. He visited Paris again in 1662, bringing out his Ecole Amante. His death occurred in Venice on the 14th of January 1676. Twenty-seven operas of Cavalli are still extant, most of them being preserved in the library of St Mark at Venice. Monteverde had found opera a musical-literary experiment, and left it a magnificent dramatic spectacle. Cavalli succeeded in making opera a popular entertainment. He reduced Monteverde’s extravagant orchestra to more practical limits, introduced melodious arias into his music and popular types into his libretti. His operas have all the characteristic exaggerations and absurdities of the 17th century, but they have also a remarkably strong sense of dramatic effect as well as a great musical facility, and a grotesque humour which was characteristic of Italian grand opera down to the death of Alessandro Scarlatti.

CAVALLINI, PIETRO (c. 1259-1344), Italian painter, born in Rome, was an artist of the earliest epoch of the modern Roman school, and was taught painting and mosaic by Giotto while employed at Rome; it is believed that he assisted his master in the mosaic of the Navicella or ship of St Peter, in the porch of the church of that saint. He also studied under the Cimabue. Longhi describes him as an adept in both arts, and mentions with approbation his grand fresco of a Crucifixion at Assisi, still in tolerable preservation; he was, moreover, versed in architecture and sculpture. According to George Vertue, it is highly probable that Cavallini executed, in 1279, the mosaics and other ornaments of the tomb of Edward the Confessor in Westminster Abbey. He would thus be the "Petrus Civis Romanus" whose name is inscribed on the shrine; but a comparison of dates invalidates this surmise. He died in 1344, at the age of eighty-five, in the odour of sanctity, having in his later years been a man of eminent piety. He is said to have carved for the Basilica of San Paolo fuori le Mura, close to Rome, a crucifix which spoke in 1370 to a female saint. Some highly important works by Cavallini in the church of Santa Cecilia in Trastevere, Rome, have been recently discovered.

CAVALLO, TIBERIUSS (1749-1804), Anglo-Italian electrician and natural philosopher, was born on the 30th of March 1749 at Naples, where his father was a physician. In 1771 he came to England with the intention of pursuing a mercantile career, but he soon turned his attention to scientific work. Although he made several ingenious improvements in scientific instruments, his mind was rather imitative and critical than creative. He published numerous works on different branches of physics, including A Complete Treatise on Electricity (1777), Treatise on the Nature and Properties of Air and other permanently Elastic Fluids (1781), History and Practice of Aeronastion (1785), Treatise on Magnetism (1787), Elements of Natural and Experimental Philosophy (1803), Theory and Practice of Medical Electricity (1780), and Medical Properties of Fatical Air (1798). He died in London on the 21st of December 1809.

CAVALLOTTI, FELICE (1842-1898), Italian politician, poet and dramatic author, was born at Milan on the 6th of November 1842. In 1860 and 1861 he fought with the Garibaldian Corps, but first attained notoriety by his anti-monarchical lampoons in the Gazzetta di Milano and in the Gazzetta Rossa between 1866 and 1867. In 1869 he was elected to Parliament as deputy for Corteolona in Lombardy, but the following year, he took the oath of allegiance after having publicly impugned its validity. Eloquence and turbulent combative in and out of parliament secured for him the leadership of the extreme Left on the death of Bertani in 1886. During his twelve years' leadership his party increased in number from twenty to seventy, and at the time of his death his parliamentary influence was greater than ever before. Though ambitious and addicted to defamatory methods of personal attack which sometimes savoured of political blackmail, Cavallotti's eloquent advocacy of democratic reform, and apparent generosity of sentiment, secured for him a popularity surpassed by that of no contemporary save Crispi. Services rendered in the cholera epidemic of 1885, his numerous lawsuits and thirty-three duels, his bitter campaign against Crispi, and his championship of French interests, combined to enhance his notoriety and to increase his political influence. By skillful alliances with the marquis di Rudini he had more than once obtained practical control of the Italian government, and exacted notable concessions to Radical demands. He was killed on the 6th of March 1898 in a duel with Count Macola, editor of the conservative Gazzetta di Venezia, whom he had assailed with characteristic interpenetration of language. By his death the house of Savoy lost a relentless foe, and the revolutionary elements in Italy a gifted, if not entirely trustworthy, leader.

CAVALRY (Fr. cavalerie, Ger. Kavallerie or Reiterei, derived ultimately from late Lat. caballus, horse), a word which came into use in military literature about the middle of the 17th century as applied to mounted men of all kinds employed for combatant purposes, whether intended primarily for charging in masses, in small bodies, or for dismounted fighting. By degrees, as greater refinement of terminology has become desirable, the idea has been narrowed down until it includes only "horsemen trained to achieve the purpose of their commander by the combined action of man and horse," and this definition will be found to cover the whole field of cavalry activity, from the tasks entrusted to the cavalry corps of 10,000 sabres down to the mere riding or driving off isolated squires and even troopers.

History.—The evolution of the cavalry arm has never been uniform at any one time over the surface of the globe, but has always been locally modified by the conditions of each community and the stage of intellectual development to which at any given moment each had attained. The first condition for the existence of the arm being the existence of the horse itself, its relative scarcity or the reverse and its adaptability to its environment in each particular district have always exercised a preponderating influence on the development of cavalry organization and tactics. The indigenous horses of Europe and Asia being very small, the first application of their capabilities for war purposes seems everywhere to have been as draught animals for chariots, the construction of which implies not only the
existence of level surfaces, perhaps of actual roads, but a very considerable degree of mechanical skill in those who designed and employed them. The whole of the classical and Oriental mythologies, together with the earliest monuments of Egypt, Assyria, and India, are convincing on this point. Nowhere can we find a trace either of description or delineation of animals physically capable of carrying on their backs the armed men of the period. All the earliest allusions to the use of the horse in war either point directly to the employment as a draft animal, or where not specific, as in the description of the war-horse in Job, they would apply equally well to one harnessed to a chariot as to one ridden under the saddle.

The first trace of change is to be found, according to Prof. Wm. Ridgeway (Origin and Influence of the Thoroughbred Horse, p. 243), in an Egyptian relief showing Nubians mounted on horses of an entirely different breed, taller and more powerful than any which had gone before them. These horses appear to have come from the vicinity of Dongola, and the strain still survives in the Sudan. The breed is traced into Arabia, where only second-rate horses had been reared hitherto, and thence to different parts of Europe, where eventually centres of cavalry activity developed. The first detailed evidence of the existence of organized bodies of mounted men is to be found in Xenophon, while, in all, and as against the Roman infantry in particular, mounted troops proved of very little service on the battlefield.

It was, however, otherwise in the sphere of strategy. There, information was of even greater importance, because harder to obtain, than it is nowadays, and the army which could put its feelers to the greater distance, surround its enemy and intercept his communications, derived nearly the same advantages as it does at present. Hence both sides provided themselves with horsemen, and when these met, each in the performance of their several duties, charges of masses naturally ensued. This explains the value attaching in the old days to the possession of horse-flesh and the rapid spread of the relatively new Dongola or African strain over the then known world.

The primitive instinct of aboriginal man is to throw stones or other missiles for purposes of defence (apes will throw anything they can find, but they never use sticks); hence, as the Romans penetrated ever farther amongst the barbarian tribes, their horsemen in first line found ever-increasing need for protection against projectiles. But the greater the weight of armour carried, the greater the amount of the weight of the horse. Then, as the weight-carrying breed was expensive, and with the decay of the Roman Empire, corruption and peculation spread, a limit was soon placed on the multiplication of charging cavalry, and it became necessary to fall back on the indigenous pony, which could only carry a rider from place to place, not charge. Thus there was a gradual levelling down of the mounted arms, the heavy cavalry becoming too heavy to gallop and the light not good enough for united action. Against such opponents, the lighter and better mounted tribesmen of Asia found their task easy. They cut off the supplies of the marching infantry, filled up or destroyed the wells, &c., and thus demonstrated the strategic necessity of superior mobility.

With the decay of civilization discipline also disappeared, and, as discipline consists essentially in the spirit of self-sacrifice for the good of the community, its opposite, self-preservation, became the guiding principle. This in turn led to the increase of armour carried, and thence to the demand for heavier horses, and this demand working through several centuries led ultimately to the breeding of the great weight-carrying animals on whose existence that of medieval chivalry depended. These horses, however, being very costly and practically useless for general purposes, could only become the property of the wealthy, who were too independent to feel the need of combination, and preferred to live on the spoliation and taxation of the weak. This spoliation eventually impelled the weaker men to combine, and at first their combination took the form of the construction of fortified places, against which mounted men were powerless.

On the other hand, expense put a limit to the area which fortifications could enclose, and this again limited the supplies for the garrison. Horsemen sweeping the country for miles around had no difficulty in feeding themselves, and the surrender of all beleaguered places through starvation was ultimately inevitable, whilst for officers and their retainers, having the deepest purse, it was of no use to introduce fighting men only into a place which primarily required food (cf. Lucknow, 1857) to protract its resistance. Hence some means had to be found to surround the supply-convoys with a physically impenetrable shield, and eighteen-foot pikes in the hands of powerful disciplined soldiers met the requirements. Against eight to ten ranks of such men the best cavalry in the world, relying only on their swords, were helpless, and for the time (towards the close of the 15th century) infantry remained masters of the field on the continent of Europe.

England meanwhile had developed on lines of her own. Thanks to her longbowmen and the military genius of her leaders, she might have retained indefinitely the command of the continent had it not been for the invention of gunpowder, which, though readily accepted by the English for sieges in France, proved the ultimate cause of their undoing. It was the French who developed the use of siege artillery most rapidly, and their cavalry were not slow to take the hint; unlike the longbow and the crossbow, the pike could be used effectively from horseback, and presently the knights and their retainers, having the deepest purse, provided themselves with long pistols in addition to their lances and swords. These weapons sent a bullet through any armour which a foot-soldier could conveniently carry, or his commander afford, and if anything went wrong with their mechanism (which was complicated and uncertain) the speed of his horse soon carried the rider out of danger. A new form of attack against infantry, introduced by the French at Cerisoles, 1544, thus developed itself. A troop or squadron, formed in from twelve to sixteen ranks, trotted up to within pistol shot of the angle of the square to be attacked and halted; then each rank in succession canterèd off man by man to the left, discharging his pistol at the square as he passed, and riding back to his place behind the column to reload. This could be prolonged indefinitely, and against such tactics the infantry were powerless. The stakes carried by English archers to check the direct charge of horsemen became useless, as did also chevaux de frise, though the latter (which originated in the 14th century) continued to be employed by the Austrians against the swiftly-charging Turks for several centuries. Thus it became necessary to devise some new impediment which, whilst remaining mobile, would also give cover and an advantage in the final hand-to-hand shock. The problem was solved in Bohemia, Poland and Moravia (Husite wars, about 1420), where, distances being great and the country open, greater mobility and capacity in the convoys became essential. Great trains of wagons were placed in charge of an infantry escort, of which a part had become possessed of firearms, and these moved across country in as many as twelve parallel lines drilled to form laagers, as nowadays
in South Africa. Again the cavalry proved helpless, and for nearly a century in central Europe the word "Wagenburg" (wagon-forts) became synonymous with "army." Then an unfortunate inspiration came to the wagon-men. A large gun was relatively cheaper to manufacture, and more effective than a small one. To keep their assailants at a distance, they mounted wall-pieces of about one-inch bore on their wagons. For a moment the balance inclined in their favour, but the cavalry were quick to see their advantage in this new idea, and they immediately followed suit. They, too, mounted guns on wheels, and, as their mobility gave them choice of position, they were able to concentrate their fire against any side of the laager, and again ultimate surrender was the only way out of the defenders' dilemma.

The interesting problem thus raised was never finally solved, for the scene of action now shifted to western Europe, to the valley of the Po, and more particularly to the Netherlands, where fortresses were closer together and the clayey nature of the Rhineland had already made paved roads necessary. Then, the Wagenburg being no longer needed for the short transits between one fortified town and another, the infantry reassessed themselves. Firearms having been much improved in the interval the troops, therefore, began to adopt the 15-pounder, to protect themselves by musketeers trained to take advantage of cover and ground somewhat in the same fashion as the modern skirmisher. These musketeers kept light guns at a distance from their pikemen, but dared not venture far out, as their fire was altogether inadequate to stop a rush of horsemen; when the latter threatened to intervene, they had to run for safety to the squares of pikemen, whom they assisted in turn by keeping the cavalry beyond pistol range. Hence the horsemen had to fall back upon more powerful guns, and these, being slow and requiring more train, could be most economically protected by infantry (see also Artillery).

Thus about the close of the 17th century western armies differentiated themselves out into the still existing three types: cavalry, artillery and infantry. Moreover, each type was subdivided, the cavalry becoming heavy, medium and dragoons. At this period there was nothing to disturb the equilibrium of two contending forces except the characters of their respective leaders. The mercenary element had trickled down even the feudal levies. The moral qualities of all were on the same indifferent level, and battles in the open followed one recognized course. Neither army being able to outmarch the other, both drew up masses of pikes in parallel lines. The musketeers covered the deployment of the heavy guns on either side, the cavalry drew up on the wings and a strictly parallel fight ensued, for in the absence of a common cause for which men were willing to die, plunder was the ruling motive, and all control and discipline melted in the excitement of the contest.

It is to the growth of Protestantism that cavalry owes its next great forward leap. To sweep the battlefield, it was absolutely essential that men should be ready to subordinate selfish considerations to the triumph of their cause. The Roman Catholicism of the day gave many loopholes for the evasion of clear duty, but from these the reformed faith was free, and it is to the reawakened sense of duty that Gustavus Adolphus appealed. This alone rendered combination amongst his subordinate leaders possible, and on this power of combination all his victories depended. Other cavalry soldiers, once let loose in the charge, could never be prevented to hold the prospect of plunder of the enemy's baggage being too strong a temptation in but the king's men could be depended on, and once brought back in formed bodies, they rode over the enemy's skirmishers and captured his batteries. Then the equilibrium of force was destroyed, and all arms combined made short work of the opposing infantry alone (Breitenfeld, 1631). But the Swedish king perished with his work half done, and matters reverted to their former condition until the appearance of Cromwell, another great leader capable of animating his men with the spirit of devotion, again rendered the cavalry arm supreme. The essence of his success lay in this, that his men were ready everywhere and always to lay down their lives for their common cause. Whether scouting 70 m. to the front of their army, or fighting dismounted to delay the enemy at defiles or to storm fortified strongholds, or charging home on the battlefield, their will power, focused on, and in turn dependent on, the personality of their great leader, dominated all human instincts of fear, rapacity or selfishness. It is true that they had not to ride against the modern rifle, but it is equally true that there was no quick-firing artillery to carry terror through the enemy's army, and it was against masses of spearmen and musketeers, not then subjected to bursting shells or the lash of shrapnel and rifle bullets, that the final charges had always to be ridden home.

Each succeeding decade thereafter has seen a steady diminution in the ultimate power of resistance of the infantry, and a corresponding increase in the power of fire preparation at the disposal of the supreme leader; and the chances of cavalry have fluctuated with the genius of that leader in the employment of the means at his disposal, and the topographical conditions existing within each theatre of war. During the campaigns in Flanders, with its multiplicity of fortresses and clayey soil, cavalry rapidly degenerated into mounted infantry, throwing away their sword and lance-proof armour, and adopting long muskets and heavier ammunition. Presently they assumed the charge at a gallop and reverted to an approach at the trot, and if (as at Blenheim) their influence proved decisive on the field of battle, this was because the conditions were common to both combatants, and the personal influence of "Corporal John," as his soldiers called Marlborough, ensured greater steadiness and better co-operation.

When Frederick II. became king of Prussia (1740), he found his cavalry almost at the nadir of efficiency; even his cuirassiers drilled principally on foot. "They can manoeuvre," on foot, "with the same precision as my grenadiers, but unfortunately they are equally slow." His enemies the Austrians, thanks to their wars against the Turks who always charged at a gallop, had maintained greater dash and mobility, and at Mollwitz the Prussians only escaped disaster by the astounding rapidity of their infantry fire. In disgust the king then wrote, "Die Cavallerie ist nicht einmal wert das sie der Teufel war, "he immediately set about their removal, with his usual promptness. Three years after Mollwitz, the result of his exertions, and of the greatly increased importance the arm acquired on the battlefield, and the charge of the Bayreuth dragoons at Hohenfriedberg (June 4, 1745), who with 1500 horses rode over and dispersed 20 Austrian battalions, bringing in 2500 prisoners and 67 colours, will always rank as one of the most brilliant feats in military history. The following years of peace (1745-1756) were devoted to the methodical preparation of the cavalry to meet the requirements that Frederick's methods of war would make upon them, and it is to this period that the student should devote special attention. From the very outbreak of the Seven Years' War (1756) this training asserted its influence, and Rossbach (1757) and Zorndorf (1758) are the principal examples of what cavalry handled in masses can effect. At Rossbach General v. Seydlitz, at the head of 38 squadrons, practically began and ended the destruction of the French army, and at Zorndorf he saved the day for the Prussians by a series of the most brilliant charges, which successively destroyed the Russian form square and cavalry. These battles so conclusively demonstrated the superiority of the Prussian cavalry that their enemies completely altered their tactical procedure. They now utilized their enormous numerical superiority by working in two separate armies, each almost as strong as the whole Prussian force. When the latter moved against either, the one threatened immediately threw up heavy entrenchments, against which cavalry were, of course, ineffective, whilst the other pursued its march. When Frederick, having more or less beaten his immediate opponent, 1 The loss of the regiment was twenty-eight killed and sixty-six wounded.
began to threaten the other army it entrenched likewise. Against these methods the Prussian army soon wore itself out, and though from time to time the cavalry locally distinguished itself, no further opportunities for great decisive blows presented themselves.

The increased demands made upon the mobility of the Prussian horsemen naturally resulted in the gradual rejection of everything which was not essential to their striking power. The long muskets and bayonets were laid aside, but the cuirass was retained for the mêlée, and by the close of the great struggle the various branches of the arm had differentiated themselves out into the types still adhered to, heavy cavalry, dragons, hussars, whose equipment as regards essentials thenceforward hardly varied up to the latter years of the 19th century. The only striking difference lies in the entire rejection of the lance in the armament of the charging squadrons, and the reason is characteristic of the principles of the day. The Prussian cavalry had realized that success was decided, not primarily by actual collision, but by the moral effect of the appearance of an absolutely closed wall of horsemen approaching the adversary at full speed. If the necessary degree of cohesion was attained, the other side was morally beaten before collision took place, and then the whole weight of the shock with so little resolution that it was ridden over without difficulty. In the former case any weapon was good enough to kill a flying enemy; in the latter, in the mêlée which then ensued, the crush in the ranks of the victors was still so great that the lance was a hindrance rather than a help.

In the years succeeding the war the efficiency of the Prussian cavalry sank very rapidly, the initial cause being the death of Seydlitz at the early age of fifty-two. His personality had alone dominated the discontent, lethargy and hopelessness created by ruthless financial economies. When he was gone, as always in the absence of a great leader, men adapted their lives to the line of least resistance. In thirty years the wreck was complete. Within the splendid squadrons which had been accustomed to manœuvre with perfect precision at the highest speed, there were (as F. A. von der Marwitz in his Nachricht clearly shows) not more than seven thoroughly trained men and horses to each, the remainder being trained for little longer and receiving less attention than is the case with modern and line or auxiliary cavalry. For the dispatch of proceedings preceding the engagement of the First Revolution, Frederick the Great's army, and especially his cavalry, had become the model for all Europe, but the mainspring of the excellence of his squadrons was everywhere overlooked. Seydlitz had manoeuvred great masses of horsemen, therefore every one else must have great masses also; but no nation grasped the secret, viz. the unconditional obedience of the horse to its rider, on which his success had depended. Neither was it possible under the prevailing social conditions to secure the old stamp of horse, or the former attention to detail on the part of men and officers. In France, owing to the agricultural decay of the country, suitable remounts for charging cavalry were almost unobtainable, and as this particular branch of the arm was almost exclusively commanded by the aristocracy it suffered most in the early days of the Revolution. The hussars, being chiefly recruited and officered by Algerians and Germans from the Rhine provinces, retained their individuality and traditions much longer than the dragons and cuirassiers, and, to the very close of the great wars, we find them always ready to charge at a gallop; but the unsteadiness and poor horsemanship of the other branches was so great that up to 1812, the year of their destruction, they always charged at a trot only, considering that the advantage of superior cohesion thus gained more than balanced the loss of momentum due to the slower pace.

Generally, the growth of the French cavalry service followed the universal law. The best big horses went to the heavy charging cavalry, viz. the cuirassiers, the best light horses to the hussars, and the dragons received the remainder, for in principle they were only infantry placed on horseback for convenience of locomotion, and were not primarily intended for combined mounted action. Fortunately for them, their principal adversaries, the Austrians, had altogether failed to grasp the lesson of the Seven Years' War. Writing in 1786 Colonel Mack, a very capable officer, said: "Even in 1769, the cavalry could not ride, could not manage to control their horses. Not a single squadron could keep its dressing at a gallop, and before they had gone fifty yards at least ten out of forty horses in the first rank would break out to the front," and though the veteran field marshal Lacy issued new regulations, their spirit seems always to have escaped the executive officers. The British cavalry was almost worse off, for economy had reduced its squadrons to mere skeletons, and the traditional British style of horsemanship, radically different from that in vogue in France, made their training for combined action even more difficult than elsewhere. Hence the history of cavalry during the earlier campaigns of the Revolution is marked by no decisive triumphs, the results are always inadequate when judged by the magnitude of the forces employed, and only the brilliant exploit of the 17th Light Dragoons (now Hussars) at Villers en Coüchê (April 24, 1794) deserves to be cited as an instance of the extraordinary influence which even a few horsemen can exercise over a demoralized or untrained mob of infantry.

When the campaign of Poland (see NAPOLEONIC CAMPAIGNS) French victories were won chiefly by the brilliant infantry fighting, cavalry only intervening (at Jena) to charge a beaten enemy and complete his destruction by pursuit. But after the terrible waste of life in the winter of 1806-7, and the appalling losses in battle, Napoleon introduced a new form of attack. The case-shot preparation of his artillery (see ARTILLERY) sowed confusion and terror in the enemy's ranks, and the opportunity was used by masses of cavalry. Henceforward this method dominated the Napoleonic tactics and strategy. The essential difference between this system and the Frederician lies in this, that with the artillery available in the former period it was not possible to say in advance at what point the intervention of cavalry would be necessary, hence the need for speed and precision of manœuvre to ensure their arrival at the right time and place. Napoleon now selected beforehand the point he meant to overwhelm and could bring his cavalry masses within striking distance at leisure. Once placed, it was only necessary to induce them to run away in the required direction to overwhelm them by a body or a wing. This method failed at Waterloo because the ground was too heavy, the slope of it against the charge, and the whole condition of the horses too low for the exertion demanded of them.

The British cavalry from 1793 to 1815 suffered from the same causes which at the beginning of the 20th century brought about its breakdown in the South African War. Over-sea transport brought the horses to land in poor condition, and it was rarely possible to afford them sufficient time to recover and become accustomed to the change in forage, the conditions of the particular theatre of operations, &c., before they had to be led against the enemy—hence a heavy casualty roll and the introduction into the ranks of raw unbroken horses which interfered with the precision of manœuvre of the remainder. Their losses (about 13% per annum) were small as compared with those of South Africa, but this is mainly accounted for by the fact that, operations being generally in the northern hemisphere, the change of climate was never so severe. Tactically, they suffered, like the Austrians and Prussians, from the absence of any conception of the Napoleonic strategy amongst their principal leaders. As it was not known where the great blow was to fall, they were distributed along the whole line, and thus became habituated to the idea of operating in relatively small bodies. This is the worst school for the cavalry soldier, because it is only when working in masses of forty to sixty squadrons that the cumulative consequences of small errors of detail become so apparent as to convince all ranks of the necessity of conforming accurately to established prescriptions. Nevertheless, they still retained the practice of charging at a gallop, and as a whole were by far the most efficient body of horsemen who survived at the close of the great wars.

In the reaction that then ensued all over Europe, cavalry
practically ceased to exist. The financial and agricultural exhaustion of all countries, and of Prussia in particular, was so complete that money was nowhere to be found for the great concentrations and manoeuvre practices which are more essential to the efficiency of the cavalry than to that of the other arms. Hence a whole generation of officers grew up in ignorance of the fundamental principles which govern the employment of their arm. It was not till 1848 that the Prussians began again to unite whole cavalry divisions for drill and manoeuvre, and the soldiers of the older generation had not yet passed away when the campaigns of 1866 and 1870 brought up again the realities of the battle-field. Meanwhile the introduction of long-range artillery and small arms had entirely destroyed the tactical relation of the three arms on which the Napoleonic tactics and strategy had been based, and the idea gained ground that the battle-field would no longer afford the same opportunities to cavalry as before. The experiences gained by the Americans in the Civil War helped to confirm this preconception. If in battles waged between infantry armed only with muzzle-loading rifles, cavalry could find no opportunity to repeat past exploits, it was argued that its chances could not fail to be still further reduced by the breech-loader. But this reasoning ignored the principal factors of former successes. The mounted men in America failed not as a consequence of the armament they encountered, but because war brought out no Napoleon to create by his skill the opportunity for decisive cavalry action, and to mass his men beforehand in confident anticipation. The same reasoning applies to the European campaigns of 1866 and 1870, and the results obtained by the arm were so small, in proportion to the numbers of squadrons available and to their cost of maintenance as compared with the other arms, that a strong reaction set in everywhere against the existing institutions, and the re-creation of the dragon, under the new name of mounted rifleman, was advocated in the hope of obtaining a cheap and efficient substitute for the cavalryman.

Later events in South Africa and in Manchuria again brought this question prominently to the front, but the essential difference between the old and new schools of thought has not been generally realized. The "mounted rifle" adherents base their arguments on the greatly increased efficiency of the rifle itself. The "cavalry" school, on the other hand, maintains that, the weapons themselves being everywhere substantially equal in efficiency, the advantage rests with the side which can create the most favourable conditions for their employment, and that, fundamentally, superior mobility will always confer upon its possessor the choice of the circumstances under which he can best engage. The advantage gained by all nations actually matched in modern warfare, neither side can afford the time to dismount, for the other will utilize that time to manœuvre into a position which gives him a relative superiority for whichever form of attack he may elect to adopt, and this relative superiority will always more than suffice to eliminate any advantage in accuracy of fire that his opponent may have obtained by devoting his principal attention to training his men on the range instead of on the mounted manœuvre ground.

Finally, the "cavalry" school reasons that in no single campaign since Napoleon's time have the conditions governing encounters been normal. Either the roadless and barren nature of the country has precluded of itself the rapid marching which forms the basis of all modern strategy, as in America, Turkey, South Africa and Manchuria, or the relative power of the infantry and artillery weapons, as in Bohemia (1866) and in France (1870), has rendered wholly impossible the creation of the great tactical opportunity characteristic of Napoleon's later method, for there then existed no means of overwhelming the enemy with a sufficient hail of projectiles to render the penetration of the cavalry feasible. The latest improvement in artillery, viz., the long-range shot and the quick-firing guns, have, however, enormously facilitated the attainment of this primary fire superiority, and, moreover, it has simplified the procedure to such a degree that Napoleon is no longer needed to direct. The battles of the future will thus, in civilized countries, revert to the Napoleonic type, and the side which possesses the most highly trained and mobile force of cavalry will enjoy a greater relative superiority over its adversary than at any period since the days of Frederick.

The whole experience of the past thus goes to show that no nation in peace has ever yet succeeded in maintaining a highly trained cavalry sufficiently numerous to meet all the demands of a great war. Hence at the outbreak of hostilities there has always been a demand for some kind of supplementary force which can relieve the regular squadrons of those duties of observation and exploration which wear down the horses most rapidly and thus render the squadrons ineffective for their culminating duty on the battle-field. This demand has been met by the enrolment of men willing to fight and rendered mobile by mounts of an inferior description, and the greater the urgency the greater has been the tendency to give them arms which they can quickly learn to use. To make a man an expert swordsman or lancer has always taken years, but he can be taught to use a musket or rifle sufficiently for his immediate purpose in a very short time. Hence, to begin with, arms of this description have invariably been issued to him. But once these bodies have been formed, and they have come into collision with trained cavalry, the advantages of mobility, combined with the power of shock, have become so apparent to all, that insensibly the "dragon" has developed into the cavalry soldier, the rate of this evolution being conditioned by the nature of the country in which the fighting took place.

This evolution is best seen in the American Civil War. The men of the mounted forces engaged had been trained to the use of the rifle from childhood, while the vast majority had never seen a sword, hence the formation of "mounted rifles"; and these "mounted rifles" developed precisely in accordance with the nature of their surroundings. In districts of virgin forests and marshland they remained "mounted rifles," in the open prairie country of the west they became cavalry pure and simple, though for want of time they never rivaled the precision of manœuvre and endurance of modern Prussian or Austrian horse. In South Africa the same sequence was followed, and had the Boer War lasted longer it is certain that such Boer leaders as de Wet and de la Rey would have reverted to cavalry tactics of shock and cold steel at the earliest possible opportunity.

Therefore when we find, extending over a cycle of ages, the same causes producing the same effects, the natural conclusion is that the evolution of the cavalry arm is subject to a universal law which persists in spite of all changes of armament.

Employment of Cavalry.—It is a fundamental axiom of all military science that the officer commanding the cavalry of any force comprising the three arms of the service is in the strictest sense an executive officer under the officer commanding that particular force as a whole. The latter again is himself responsible to the political power he represents. When intricate political problems are at stake, it may be, and generally is, quite impracticable that any subordinate can share the secret knowledge of the power to which he owes his allegiance.

The essence of the value of the cavalry soldier's services lies in this, that the demand is never made upon him in his supremest form until the instinct of the real commander realizes that the time has come. Whether it be to cover a retreat, and by the loss of hundreds to save the lives of tens of thousands, or to complete a victory with commensurate results in the opposite direction, the obligation remains the same—to strike the last man and horse in the attainment of the immediate object in view, the defeat of the enemy. This at once places the leader of cavalry in face of his principal problem. It is a matter of experience that the broader the front on which he can deliver a charge, the greater the chances of success. However strong the bonds of discipline may be, the line is ultimately, and at a moment of the greatest peril, composed of a number of men on horses, acting and reacting on one another in various ways. When therefore, of two lines, moving to meet one another at speed, one sees itself overlapped to either hand, the men in the line thus overlapped invariably and inevitably tend to open outwards, so as to meet at least their enemy on an equal frontage. Hence
every cavalry commander tries to strike at the flank of his enemy, and the latter manoeuvres to meet him; and if both have equal mobility, local collision must ensue on an equal and parallel front. Therefore both strive to put every available man and horse in their first line, and if men and horses were invulnerable such a line would sweep over the ground like a scythe and nothing could withstand it. Since, however, bullets kill at a distance, and inequalities and unforeseen difficulties of the ground may throw hundreds of horses and riders, a working compromise has to be found to meet eventualities, and, other things being equal, victory inclines to the leader who best measures the risks and uncertainties of his undertaking, and keeps in hand a sufficient reserve to meet all chances.

Thus there has arisen a saying, which is sometimes regarded as axiomatic, that in cavalry encounters the last closed reserve always wins. The truth is really that he who has best judged the situation and the men on both sides finds himself, in possession of the last reserve at the critical moment. The next point is, how to ensure the presence of this reserve, and what is the critical moment. The battle-field is the critical moment in each phase of every campaign—not the mere chance locality on which a combat takes place, but the decisive arena on which the strategic consequences of all pre-existing conditions of nationality and local organization come to the front of the stage. It is indeed the judgment-seat of nature, on which the right of the race to survive in the struggle for existence is weighed and measured in the most impartial scales.

Before, however, the final decision of the battle-field can be attained, a whole series of subordinate decisions have to be fought out, success in each of which conditions the result of the next series of encounters. Every commanding officer of cavalry thus finds himself, successively called on to win a victory locally at any cost, and the question of economy of force does not concern him at all. Hence the same fundamental rules apply to all cavalry combats, of whatever magnitude, and condition the whole of cavalry tactics. Broadly speaking, if two cavalries of approximately equal mobility manœuvre against each other in open country, neither side can afford the loss of time that dishonoring to fight on foot entails. Hence, assuming that at the outset of a campaign each side aims at securing a decisive success, both seek out an open plain and a mounted charge, sword in hand, for the decision. When the speed and skill of the combatants are unequal, cavalry may be used, as in a line, or in parallel fronts, and the threat of the overwhelming line is the principal factor in the decision. The better the individual training of man and horse the less will be the chances of unsteadiness or local failures in execution, and the less the need of reserves; hence the force which feels itself the most perfect in the individual efficiency of both man and horse (on which therefore the whole ultimately depends) can afford to keep fewer men in reserve and can thus increase the width of its first line for the direct collision. Careful preparation in peace is therefore the first guarantee of success in action. This means that cavalry, unlike infantry, cannot be expanded by the absorption of reserve men and horses on the outbreak of hostilities, but must be maintained at war strength in peace, ready to take the field at a moment's notice, and this is actually the standard of readiness attained on the continent of Europe at the present day.

Further, uniformity of speed is the essential condition for the execution of closed charges, and this obviously cannot be assured if big men on little horses and small men on big horses are indiscriminately mixed up in the same units. Horses and men have therefore been divided into three categories, light, medium and heavy, and in periods when war was protracted, chronic, suitable duties have been allotted to each. It is clear, on purely mechanical grounds, that the greater the velocity of motion at the moment of collision the greater will be the chances of success, and this greater speed will be on the side of the bigger horses as a consequence of their longer stride. On the other hand, these horses, by reason of their greater weight, are used up much more rapidly than small ones. Hence, to ensure the greater speed at the moment of contact, it is necessary to save them as much as possible to keep them fresh for the shock only, and this has been the practice of all great cavalry leaders all over the world, and has only been departed from under special circumstances, as by the Germans in France in 1870, when their cavalry practically rode everywhere unopposed.

Collisions, however, must be expected by every body of troops large or small; hence each regiment—ultimately each squadron—endeavours to save its horses as far as this is compatible with the attainment of the special object in view, and this has led everywhere and always to a demand for some intermediate arm, less expensive to raise and maintain than cavalry proper, and able to cover the ground with sufficient rapidity and collect the information necessary to ensure the proper direction of the cavalry commands. Originally this intermediate force received the designation of dragoons; but since under pressure of circumstances during long periods of war these invariably improved themselves into cavalry and became permanent units in the army organization, fresh names have had to be invented for them, of which Mounted Infantry and Mounted Rifles are the latest, and every improvement in firearms has led to an increased demand for their services.

It is now relatively easy to trace out the considerations which shaped the interpretation of his cavalry by the officer commanding a force of the three arms. Assuming for purposes of illustration an army numerically weak in cavalry, what course will best ensure the presence of the greatest number of sabres at the decisive point, i.e., on the battle-field? To push out cavalry screens far to the front will be to court destruction, nor is the information they obtain of much real service unless the means to act upon it at once is at hand. This can only be supplied economically by the use of strong advanced guards of infantry, and such supplementary security and information as these may require will be best supplied by mounted infantry, the sacrifice of whom will disturb least the fighting integrity of the whole army.

Imagine an army of 300,000 men advancing by five parallel roads on a front of 50 m., each column (60,000 men, 2 army corps) being covered by a strong advance guard, coming in contact with a similarly constituted army moving in an opposite direction. A series of engagements will ensue, in each of which the object of the local commander will be to paralyse his opponent's will-power by a most vigorous attack, so that his superior officer following him on the same road will be free to act as he chooses. The front of the two armies will now be defined by a line of combats localised each about a comparatively small area, and between them will be wide gaps which it will be the chief business of the directing minds on either side to close by other troops as soon as possible. Generally the call will be made upon the artillery for this purpose, since they can cover the required distances far more rapidly than infantry. Now, as artillery is powerless when limbered up and always very vulnerable on the flanks of the long lines, a strong cavalry escort will have to be assigned to them which, trotting forward to screen the march, will either come in contact with the enemy's cavalry advancing with a similar object, or themselves find an opportunity to catch the enemy's guns at a disadvantage. These are opportunities for the cavalry, and if necessary it must sacrifice itself to turn them to the best account. The whole course of the battle depends on success or failure in the early formation of great lines of guns, for ultimately the victor in the artillery duel finds himself in command of the necessary balance of guns which are needed to prepare the way for his final decisive infantry attack. If this latter succeeds, then any mounted men who can gallop and shoot will suffice for pursuit. If it fails, no cavalry, however great, can carry any hope of definitely restoring the combat, for against victorious infantry cavalry, now as in the past, can but gain a little time. This time may indeed be worth the price at which it can be bought, but it will always be more economical to concentrate all efforts to prevent the emergency arising.

After the Franco-German War much was written about the possibility of vast cavalry encounters to be fought far in advance of the main armies, for the purpose of obtaining information, and ideas were freely mooted of wide-flung raids traversing
the enemy's communications, breaking up his depots, reserve formations, &c. But riper consideration has relegated these suggestions to the background, for it is now evident that such expeditions involve the dissemination of force, not its concentration. Austria and France for example would scarcely throw their numerically inferior cavalry against the Germans, and nothing would suit them better than that the latter should hurl their squadrons against the frontier guards, advanced posts, and, generally, against unbeaten infantry; nor indeed would the Germans stultify their whole strategic teaching by weakening themselves for the decisive struggle. It follows therefore that cavalry reconnaissance duties will be strictly local and tactical, and that arrangements will be made for procuring strategic information by wireless telegraphy, balloons, motor cars, bicycles, &c., and that on the whole that nation will be best served in war which has provided in peace a nucleus of mounted infantry capable of rapid expansion to fill the gap which history shows always to have existed between the infantry and the cavalry. Such troops need not be organized in large bodies, for their mission is to act by "slimmery," not by violence. They must be the old "verlorene Haufe" (angl., forlorn hope) of former days, men whose individual bravery and decision is of the highest order. But they can never become a "compelling arm," through the mere fact that they may well hope to obtain the great opportunity for their cavalry, and share with them in harvesting the fruits of victory.

The great cavalry encounters of forty to sixty squadrons on either side, which it has been shown must arise from the necessity of screening or preventing the formation of the all-important artillery lines, will take their form mainly from the topographical conditions of the district, and since on a front of 60 to 100 m. these may vary indefinitely, cavalry must be trained, as indeed it always has been, to fight either on foot or on horseback as occasion requires. In either case, thoroughness of preparation in horsemanship (which, be it observed, includes horsemastertship) is the first essential, for in the end victory will rest with the side which can put in the right place with the greatest rapidity the greatest number of sabres or rifles. In the case of rifles there is a greater margin of time available and an initial failure is not irrecoverable, but the underlying principle is the same in either case; and since it is impossible to foretell exactly the conditions of the collision, all alike, according to the class to which they belong, must be brought up to the highest standard of knowledge and the motion required for covering long distances with the least expenditure of physical and nervous strength on the part both of horse and rider. As a consequence of successes gained in these preliminary encounters, opportunities will subsequently arise for the balance of fresh or rallied squadrons in hand to ride home upon masses of infantry disorganized and demoralized by the combined fire of infantry and artillery, and such opportunities are likely to be much more numerous at the outbreak of future wars than they have been in the past, because the enormous gain in range and rapidity of fire enables a far greater weight of metal to be concentrated on any chosen area within a given time. It cannot be too often reiterated that cavalry never has ridden over unshaken infantry of average quality by reason of its momentum alone, but that every successful cavalry charge has always owed its issue to a previously acquired moral superiority which has prevented the infantry from making adequate use of their means of defence. Nor will such charges entail greater losses than in the past, for, great though the increase of range of modern infantry weapons has been, the speed and endurance of cavalry has increased in a yet higher ratio; whereas in Napoleon's days, with an extreme range for musketry of 1000 yds., cavalry were expected only to trot 800 yds. and gallop for 200, nowadays with an extreme infantry range of under 4000 yds., the cavalry are trained to trot for 8000 yds. and gallop for 2000.

Neither the experiences in South Africa nor those in Manchuria seriously influenced the views of the leading cavalry experts as above outlined, for the conditions of both cases were entirely abnormal. No nation in western Europe can afford to mount the whole of its able-bodied manhood, nor, with the restricted area of its possessions, could repeat the Boer tactics with useful effect; in Manchuria, the theatre of operation was so far roadless, and the motives of both combatants so distinct from any conceivable as a basis for European strategy, that time was always available to construct entrenchments and obstacles physically insuperable to mounted arms. In western Europe, with its extreme development of communications, such tactics are impracticable, and under the system of compulsory service which is in force in all nations, an early decision must be sought at any cost. This motive imposes a rapid-marching campaign in the Napoleonic style, and in such warfare there is neither time nor energy available for the erection of extemporized fortresses. Victory must therefore fall to the side that can develop the greatest fire power in the shortest time. The greatest factor of fire power is the long artillery lines, and as cavalry is the one arm which by its mobility can harass or prevent the formation of such lines, on its success in this task all else must depend. Hence both sides will concentrate every available horse and man for this special purpose, and on the issue of the collisions this mutual concentration must entail will hang the fate of the battle, and ultimately of the situation. But here the emphasis, in this task will be that the one in which the spirit of duty is highest, and the oath of allegiance, renewed daily on the cross of the sword, is held in the highest esteem.

Organization.—The existing organization of cavalry throughout the civilized world is an instance of the "survival of the fittest" in an extreme form. The execution of the many manoeuvres with the speed and precision which condition success is only possible by a force in which, as Frederick the Great said, "every horse and trooper has been finished with the same care that a watchmaker bestows upon each wheel of the watch mechanism." Uniformity of excellence is in fact the keystone of success, and this is only attainable where the mass is subdivided into groups, each of which requires superintendence enough to absorb the whole energy of an average commander. Thus it has been found by ages of experiment that an average officer, with the assistance of certain subordinates to whom he delegates as much or as little responsibility as he pleases, finds his time fully occupied by the care of about one hundred and fifty men and horses, each individual of which he must understand intimately, in character, physical strength and temperament, for he must be guided with the utmost care and judgment if the best that each is capable of is to be attained. The fundamental secret of the exceptional efficiency attained by the Prussian cavalry lies in the fact that they were the first to realize what the above implies. After the close of the Napoleonic Wars they made their squadron commanders responsible, not only for the training of the combatants of their unit, but also for the breaking in of remounts and the elementary teaching of recruits as well, and in this manner they obtained an intimate knowledge of their material which is almost unattainable by British officers owing to the conditions entailed by foreign service and frequent changes of garrisons.

Further, to obtain the maximum velocity of manoeuvre with the minimum exertion of the horses, the squadron requires to be subdivided into smaller units, generally known as troops, and experience has shown that with 128 sabres in the ranks (the average strength on parade, after deducting sick and young horses, and the N.C. officers required as troop guides, &c.) four troops best satisfy all conditions; as, with this number, the squadron will, under all circumstances of ground and surroundings, make any change of formation in less time and with greater advantage than with any other number of subdivisions. The size of the unit next above the squadron, the regiment, is again fixed by the number of subordinates that an average commander can control, and the universal experience of all arms has settled this as not less than four and not more than eight. Experiments with eight and even ten squadrons have been tried both in Austria and Prussia, but only exceptional men have succeeded in controlling such large bodies effectively, and in the end the normal has been fixed at four or five squadrons in quarters, and three or four in the field. Of these, the larger number
CAVALRY

is undoubtedly preferable, for, with the work of the quarter-
master and the adjutant to supervise, in addition, the regimental
commander is economically applied to the best advantage.
The essential point, however, is that the officer commanding the
regiment does not interfere in details, but commands his four
squadron commanders, his quartermaster, and his adjutant,
and holds them absolutely responsible for results.

There is no unity of practice in the constitution of larger units.
Brigades vary according to circumstances from two regiments to
four, and the composition of divisions fluctuates similarly.
The custom in the German cavalry has been to form brigades of
two regiments and divisions of three brigades, but this practice
arose primarily from the system of recruiting and has no tactical
advantage. The territory assigned to each army corps provides
men and horses for two regiments of cuirassiers or lancers (classed
as heavy in Germany), two of dragons, and two of husars,
and since it is clearly essential to ensure uniformity of speed and
endurance within those units most likely to have to work together,
it was impossible to mix the different classes. But the views now
current as to the tactical employment of cavalry contemplate
the employment not only of divisions but of whole cavalry
corps, forty to sixty squadrons strong, and these may be called
on to fulfill the most various missions. The farthest and quickest
reconnaissance behind the infantry, the provision of cannon
artillery, the most obstinate attack and defence of localities the
task of dragons, and the decisive charges on the battle-field essentially
the duty of the heavy cavalry. It seems probable then that the
brigade will become the highest unit the composition of which
is fixed in peace, and that divisions and corps will be put together
by brigades of uniform composition, and assigned to the several
sections of the theatre of war in which each is likely to find the
most suitable field for its special character. This was the case
in the Frederician and Napoleonic epochs, when efficiency and
experience in the field far outweighed considerations of ad-
ministration and convenience in quarters.

Hitherto, horse artillery in Europe has always formed an
integral portion of the divisional organization, but the system
has never worked well, and in view of the technical evolution
of artillery material is no longer considered desirable. As it is
always possible to assign one or more batteries to any particular
brigade whose line of march will bring it across villages, defiles,
&c. (where the support of its fire will be essential), and on the
battle-field itself responsibility for the guns is likely to prove
more of a hindrance than a help to the cavalry commander, it is
probable that horse artillery will revert to the infantry in the
hands of its own technical officers, and that the sole tie which will be
retained between it and the cavalry will be in the batteries being
informed as to the cavalry units they are likely to serve with in
war, so that the officers may make themselves acquainted with
the idiosyncrasies of their future commanders. The same course
will be pursued with the engineers and technical troops required
for the cavalry, but it seems probable that, in accordance with a
suggestion made by Moltke after the 1866 campaign, the supply
columns for one or more cavalry corps will be held ready in peace,
and specially organized to attain the highest possible mobility
which modern technical progress can ensure.

The general causes which have led to the differentiation of
cavalry into the three types—husars, dragoons and heavy—
have already been dealt with. Obviously big men on little horses
cannot maneuvre side by side with light men on big horses. Also,
since uniformity of excellence within the unit is the prime
condition of efficiency, and the greatest personal dexterity is
required for the management of sword or lance on horseback,
a further sorting out became necessary, and the best light weights
were put on the best light horses and called husars, the best
heavy weights on the best heavy horses and called lancers, the
average of each type becoming dragonos and cuirassiers. In
England, the lance not being indigenous and the conditions of
foreign service making adherence to a logical system impossible,
lancers are medium cavalry, but the difference of weights carried
and type of horses is too small to render these distinctions of
practical moment. In Germany, where every suitable horse
finds its place in the ranks and men have no right of individual
selection, the distinctions are still maintained, and there is a
very marked difference between the weights carried and the
types of men and horses in each branch, though the dead weight
which it is still considered necessary to carry in cavalry likely
to maneuvre in large masses hardly varies with the weight of
the man or size of the horse.

Where small units only are required to march and scout,
the kit can be reduced to a minimum, everything superfluous for
the moment being carried on hired transport, as in South Africa.
But when 10,000 horsemen have to move by a single road all
transport must be left miles to the rear, and greater mobility for
the whole is attained by carrying upon the horse itself the
essentials for a period of some weeks. Still, even allowing for
this, it is impossible to account for the extraordinary load that
is still considered necessary. In India, the British lancer,
averaging 11 st. per man, could turn out in marching order at
77. 8 lb (less forage nets). In Germany, the hussar, averaging
20 st. 6 lb, rode at 18 st., also without forage, and the cuirassier
at 21 st. to 22 st. Cavalry equipment is, in fact, far too heavy,
for in the interests of the budgets of the departments which supply
saddlery, harness, &c., everything is made so as to last for many
years. Cavalry saddles fifty years old remain in good condition,
but the losses in horse-flesh this excessive solidity entails are
great. The troops are kept separate and, few realize that in war it is cheaper to replace a horse than
a saddle. In any case, the armament alone of the cavalry soldier
makes great demands on the horses. His sword and scabbard
weigh about 4 lb, carbin or rifle 7 lb to 9 lb, 120 rounds of
ammunition with pouches and belts about 12 lb, lance about 5 lb,
and two days' forage and hay at the lowest 40 lb, or a gross total
of 70 lb or 5 st., which with 11 st. for the man brings the total
to 16 st.; add to this the lightest possible saddle, bridal, cloak and
blanket, and 17 st. 8 lb is approximately the irreducible
minimum. It may be imagined what care and management of
horses is required to enable them under such loads to
maneuvre in masses at a trot, and gallop for distances of 5 m.
and upwards without a moment for dismounting.

Reconnaissance and Scouting.—After 1870 public opinion,
 misled by the performances of the "ubiquitous Uhlan" and
disappointed by the absence of great cavalry charges on the field
of battle, came somewhat hastily to the conclusion that the day
of "shock tactics" was past and the future of cavalry lay in acting
as the eyes and ears of the following armies. But, as
it happens, the fact was overlooked that the German cavalry
screen was entirely unopposed in its reconnoitering expedi-
tions, and it was not till long afterwards that it became apparent how
very little these far-flung reconnaissances had contributed to
the total success.

It has been calculated by German cavalry experts that not
1% of the reports sent in by the scouts during the advance from
the Saar to the Meuse, August 1870, were of appreciable import-
ance to the headquarters, and that before the orders based upon
this evidence reached the front, events frequently anticipated
them. Generally the conviction has asserted itself, that it is
impossible to train the short-service soldiers of civilized nations
sufficiently to render their reports worth the trouble of collating,
and if a few cases of natural aptitude do exist nothing can ensure
that these particular men should be sufficiently well mounted
to transmit their information with sufficient celerity to be of
importance. It is of little value to a commander to know that
the enemy was at a given spot forty-eight hours previously,
unless the sender of the report has a sufficient force at his disposal
to compel the enemy to remain there; in other words, to attack
and hold him. Cavalry and horse artillery alone, however, cannot
economically exert this holding power, for, whatever their effect
on the enemy's wing, the possession of a great body of fresh
infantry they are relatively powerless. Hence, it is probable
that we shall see a revival of the strategic advanced guard of all
arms, as in the Napoleonic days, which will not only reconnoitre,
but fix the enemy until the army itself can execute the maneuvre
designed to effect his destruction. The general situation of the

enemy's masses will, in western Europe, always be sufficiently fixed by the trend of his railway communications, checked by reports of spies, newspapers, &c., for, with neutral frontiers everywhere within a few hours' ride for a motor cyclist, anything approaching the secrecy of the Japanese in Manchuria is quite unattainable, and, once the great masses begin to move, the only "shadowing" which holds out any hope of usefulness is that undertaken by very small selected parties of officers, perfectly mounted, daring riders, and accustomed to cover distances of 100 m. and upwards. These will be supported by motor cars and advanced feelers from the field telegraphs, though probably the motor car would carry the eye-witness to his destination in less time than it would take to draft and signal a complete report.

Tactical scouting, now as always, is invaluable for securing the safety of the marching and sleeping troops, and brigade, divisional and corps commanders will remain dependent upon their own squadrons for the solution of the immediate tactical problem before them; but, since both sides will employ mounted men to screen their operations, intelligence will generally only be won by fighting, and the side which can locally develop a marked fire superiority will be the more likely to obtain the information it requires. In this direction the introduction of the motor car and of cyclists is likely to exercise a most important influence, but, whatever may be the conveyance, it must be looked upon as a means of advance only, never of retreat. The troops thus conveyed must be used to seize villages or defiles about which the cavalry and guns can manœuvre.

Formations and Drill.—Cavalry, when mounted, act exclusively by "shock" or more precisely by "the threat of their shock," for the immediate result of collision is actually decided some instants before this collision takes place. Experience has shown that the best guarantee for success in this shock is afforded by a two-deep line, the men riding knee to knee within each squadron at least. Perfect cavalry can charge in larger bodies without intervals between the squadrons, but, ordinarily, intervals of about 10 yds. between adjacent squadrons are kept to localize any partial unsteadiness due to difficulties of ground, casualties, &c. The obvious drawbacks of a two-deep line are that it halves the possible extent of front, and that if a front-rank horse falls the rear-rank horse generally tumbles over it also. To minimize the latter evil, the charge in two successive lines, 150 to 200 yds. apart, is best advocated, but, this has never stood the test of serious cavalry fighting; first, because when squadrons are galloping fast and always striving to keep the touch to the centre, if a horse falls the adjacent horses close in with such force that their sidelong collision may throw down more and always creates violent oscillation; and secondly, because owing to the dust raised by the first rank the following one can never maintain its true direction. It is primarily to avoid the danger and difficulty arising from the dust that the ranks in manoeuvre are closed to within one horse's length, as, when moving at speed, the rear rank is past before the dust has time to rise.

Of all formations, the line is the most difficult to handle, and, particularly, to conceal—hence various formations in column are necessary for the preliminary manoeuvres requisite to place the squadrons in position for the final deployment previous to the charge. Many forms of these columns have been tried, but, setting aside the columns intended exclusively for marching along roads, of which "sections" (four men abreast) is most usual in England, only these survive:—

Squadron column.
Double column of squadrons.
Half column.

In squadron column, the troopers of the squadron formed are in line one behind the other at a distance equal to the front of the troop in line. The ideal squadron consists of 128 men formed in two ranks giving 64 files, and divided into four troops of 16 files—a larger number of troops makes the drill too complicated, a smaller number makes each troop slow and unhandy. When the squadron is weak, therefore, the troop should still be maintained as near 16 files as possible, the number of troops being if necessary reduced. Thus with only 32 files, two troops of 16 files would be better than four of only 8 files.

All other formations of the regiment or brigade are fundamentally derived from the squadron column, only varying with the order in which the squadrons are grouped, the intervals which separate them. Thus the regiment may move in line of squadron columns at close interval, i.e. 11 paces apart or in double column as in the diagram. To form line for the charge, the squadrons open out, still in column, to full interval, i.e. the width they occupy when in line; and then on the command "Line to the front," each troop moves up to its place in line as shown in the diagram. When in line a large body of cavalry can no longer vary its direction without sacrificing its appearance of order, and as above pointed out, it is this appearance of order which really decides the result of the charge before the actual collision. Since, however, the enemy's movements may compel a change, an intermediate formation is provided, known as the "half column." When this formation is ordered, the troops within each squadron wheel half right or left, and each squadron is then able to form into column or line to the front as circumstances demand, or the whole line can be formed into column of troops by continuing the wheel and in this formation galloping out into a fresh direction, re-forming line by a simple wheel in the shortest possible time.

CAVAN, a county in the province of Ulster, Ireland, bounded N. by Fermanagh and Monaghan, E. by Monaghan and Meath, S. by Meath, Westmeath and Longford, and W. by Longford and Leitrim. The area is 477,399 acres, or about 346 sq. m. The surface of the county is uneven, consisting of hill and valley, with a maximum depression of ground, but only in its northern extremity attaining a mountainous elevation. The barony of Tullyhaw, bordering on Fermanagh, a wild dreary mountain district, known as the kingdom of Glan or Glengavlin, contains the highest land in the county, reaching 1218 ft. in Cucilagh, the place of inauguration for the Maguires, chieftains of Fermanagh, held in veneration by the peasantry, in connexion with legends and ancient superstitions. The remainder of the county is not deficient in wood, and contains numerous lakes, generally of small dimensions, but of much beauty, especially Lough Oughter, with its many inlets and islands formed by the Erne river, between the towns of Cavan and Killashandra. The county also shares with other counties the waters of Lough Gowna and Lough Sheelin, in which, as elsewhere in the county, the fishing is good. The chief river in the county is the Erne, which originates in Lough Scrabby, one of the minor sheets of water communicating with Lough Gowna on the borders of Longford. The river takes a northerly direction by Killashandra and Belturbet, being enlarged during its course by the Annalee and other smaller streams, and finally enters Lough Erne near the northern limit of the county. The other waters, consisting of numerous lakes and swamps, and small streams, are tributary to the Erne. A copious spring called the Shannon Pot, at the foot of the Cucilagh Mountain, in the barony of Tullyhaw, is regarded as the source of the river Shannon. The Blackwater, a tributary of the Boyne, also rises in this county, near Bailieborough. Several mineral springs exist in this county, the chief of which is near the once frequented village of Swainlinbar. In the neighbourhood of Belturbet, near the small lake of Annagh, is a carbonated chalybeate spring. There are several other springs of less importance; and the small Lough Leighs, or Lough-an-Leighags, which signifies the healing lake, on the summit of a mountain between Bailieborough and Kingscourt, is celebrated for its antiscorbutic properties. The level of this lake never varies. It has no visible supply nor vent for its discharge; nor is it ever frozen during the severest winters.

Geology.—This elongated county includes on the north-west some of the hilltop of Millstone Grit and Coal-Measures that rises above Lough Allen. The beds below these are referred to the English Yoredale series. It includes some of the well-known series that the Shannon rises, under the high outlit of grit on Cuilcagh. The Carboniferous Limestone then stretches down to Cavan town, a bold outlier of the higher strata being left above Bailieborough. Erne Meath and the Shannon Meath form the classic articenter series of expansions and loops, with islands between them, known as Lough Oughter. At this point we pass on to the axis of underlying Silurian strata that runs from Longford to Donaghadee. The land here on the hills that culminate about Cross Keys on the old Dublin-coach road, is a patch of granite, indicating doubtless a core like that exposed at Newry, is seen in a hollow at Crossoney. On the south side of this axis of older rocks, we reach Carboniferous shale and limestone at Lough Sheelin, and here enter on the great central plateau. The extreme south-east of the county includes part of the Triassic outlier of Kingscourt. The coal-seams and concretions of clay-ironstone in the north-west area resemble those mentioned under the head of Roscommon. Anthracite, probably of inorganic origin, has been mined without permanent success in the Silurian beds near Kilnaleck, and is traceable freely, associated with veins of quartz and haematite, at Balljamesduff a little farther east.

Climate and Industries.—The climate suffers from the dampness arising from the numerous lakes and the nature of the soil, and from the boisterous winds which frequently prevail, more especially in the higher districts. The soil is generally a stiff clay, cold and watery, but capable of much improvement by drainage, for which its undulating surface affords facilities. Only about one-sixteenth of the total area is quite barren. Agriculture makes little progress; the extent of the farms being generally small. Oats and potatoes are the principal crops. Flax, once of some importance, is almost neglected. In the mountainous parts, however, where the land is chiefly under grazing, the farms are larger, and in stock-raising the county is progressing.

Cavan is not a manufacturing county. The bleaching of linen and the distillation of whisky are both carried on to a small extent, but the people are chiefly employed in agricultural pursuits and in the sale of home produce. The soil in those districts not well adapted for tillage is peculiarly favourable for trees. The woods were formerly very considerable, and the timber found in the bogs is of large dimensions; but plantations are now chiefly found in demesnes, where they are extensive.

The county is not well supplied with railways. The Great Northern from Clones to Cavan, and the Midland Great Western from Mullingar in Westmeath to Cavan, form a through line from north to south. The Great Northern has branches to Belturbet from Ballyhaise, and to Cootehill from Ballybay; the Midland Great Western has a branch to Killashandra, and from Navan in Meath to Kingscourt, just within Cavan. The Cavan & Leitrim railway starts from Belturbet and soon leaves the county to the west.

Population and Administration.—The population (111,917 in 1891; 97,541 in 1901), of which about 80% are Roman Catholics, shows a decrease among the most serious of the Irish counties, and emigration returns are among the heaviest. The population is almost wholly rural, the only towns being the small ones of Cavan (pop. 2822, the county town), Cootehill (1590), Belturbet (1587) and Bailieborough (1004). The county is divided into eight baronies, and contains thirty-two parishes and parts of parishes. It is almost entirely within the Protestant and Roman Catholic dioceses of Kilmore. The assizes are held at Cavan, and quarter sessions are held at Cavan, Bailieborough, Cootehill and Baillyconnell. Before the Union the county returned six members to the Irish parliament, two for the county at large, and two for each of the boroughs of Cavan and Belturbet; but since that period it has been represented in the imperial parliament by two members only, for the east and west divisions.

History and Antiquities.—At the period of the English settlement, and for some centuries afterwards, this district was known as the Brenny, being divided between the families of O’Rourke and O’Reilly; and its inhabitants, protected by the nature of the country, long maintained their independence. In 1579 Cavan was made shire ground as part of Connaught, and in 1584 it was formed into a county of Ulster by Sir John Ferrott, and subdivided into seven baronies, two of which were assigned to Sir John O’Reilly and three to other members of the family; while the two remaining, possessed by the septs of Mackernon and Magauran, and situated in the mountains bordering on O’Rourke’s country, were left subject to their ancient tenures and the exactions of their Irish lord. The county subsequently came within the scheme for the plantation of Ulster under James I. The population is less mixed in race than in most parts of Ulster, being generally of Celtic extraction. Some few remains of antiquity remain in the shape of cairns, raths and the ruins of small castles, such as Cloughoughter Castle on an island (an ancient crannog) of Lough Oughter. Three miles from the town of Cavan is Kilmore, with its cathedral, a plain erection containing a Romanesque doorway brought from the abbey of Trinity Island, Lough Oughter. The bishopric dates
from about 1450. A portion of a round tower is seen in the churchyard of the parish of Drumlane at Belturbet.

CAVAN, a market-town and the county town of Co. Cavan, Ireland, near the centre of the province, in the western parliamentary division, 853 m. N.W. of Dublin by the Midland Great Western railway, and the terminus of a branch of the Great Northern railway from Clones. Pop. of urban district (1901), 2822. It is on one of the tributary streams of the Annalas river, in a broad valley surrounded on every side by elevated ground, with picturesque environs, notably the demesnes of Farnham and of Kilmore, which belongs to the bishops of that diocese. Cavan has no buildings of antiquarian interest, but the principal county institutions are here, and the most conspicuous building is the grammar school, founded by Charles I. It was rebuilt in 1819 on an eminence overlooking one of the main entrances into the town, and is capable of accommodating 100 resident pupils. The college of St Patrick is near the town. Cavan has some linen trade, and a considerable retail business is transacted in the town. A monastery of Dominican friars, founded by O'Reilly, chieftain of the Brenny, formerly existed here, and became the burial-place of the celebrated Irish general, Owen O'Neill, who died as is supposed by poison, in 1640, at Cloughoughter. There was also the castle of the O'Reillys, but this and all other antiquities of the town were swept away during the violent and continuous feuds to which the country was subject. In 1660 the chief portion of the town was burned by the Enniskeels, under General Wolseley, when they routed a body of James II.'s troops under the duke of Berwick.

CAVANILLES, ANTONIO JOSÉ (1745-1804), Spanish botanist, was born at Valencia on the 16th of January 1745. He was educated at the university of that town, and in 1777 went to Paris, where he resided twelve years, engaged in the study of botany. In 1801 he became director of the botanic gardens at Madrid, where he died on the 4th of May 1804. In 1785-1786 he published Monadelphie Classis Dissertationes X., and in 1791 he began to issue Icones et descriptions plantarum Hispanicæ. His nephew, ANTONIO CAVANILLES (1805-1864), was a distinguished advocate, and the author of a history of Spain, published at Madrid in 1860-1864.

CAVATINA (Ital. diminutive of cavato, the producing of tone from an instrument, plural cavatine), originally a short song of simple character, without a second strain or any repetition of the air. It is now frequently applied to a simple melodic air, as distinguished from a brilliant aria, recitative, &c., and often forms part of a large movement or scena in oratorio or opera.

CAVE, EDWARD (1660-1754). English printer, was born at Newnham, Warwickshire, on the 27th of February 1661. His father, Joseph Cave, was of good family, but the entail of the family estate being cut off, he was reduced to becoming a cobbler at Rugby. Edward Cave entered the grammar school of that town, but was expelled for robbing the master's hen-roost. After many vicissitudes he became apprentice to a London printer, and after two years was sent to Norwich to conduct a printing house and publish a weekly paper. While still a printer he obtained a place in the post office, and was promoted to be clerk of the franks. He was at this time engaged in supplying London newsletters to various country papers; and his enemies, who had twice summoned him before the House of Commons for breach of privilege, now accused him of opening letters to obtain his news, and he was dismissed the service. With the capital which he had saved, he set up a small printing office at St John's Gate, Clerkenwell, which he carried on under the name of R. Newton. He had long formed a scheme of a magazine "to contain the essays and intelligence which appeared in the two hundred half-sheets which the London press then threw off monthly," and had tried in vain to persuade some publisher to take it up. In 1731 he himself put it into execution, and began the Gentleman's Magazine (see Periodicals), of which he was the editor, under the pseudonym "Sylvanus Urban, Gent." The magazine had a large circulation and brought a fortune to the projector. In 1732 he began to issue reports of the debates in both Houses of Parliament. He commissioned friends to note the speeches, which he published with the initial and final letters of personal names. In 1738 Cave was censured by parliament for printing the king's answer to an address before it had been announced by the speaker. From that time he called his reports the debates of a "parliament in the empire of Lilliput" (see Reporting). To piece together and write out the speeches for this publication was Samuel Johnson's first literary employment. In 1747 Cave was reprimanded for publishing an account of the trial of Lord Lovat, and the reports were discontinued till 1752. He died on the 10th of January 1754. Cave published Dr Johnson's Rambler, and his Irene, London and Life of Savage, and was the subject of a short biography by him.

CAVE, WILLIAM (1637-1713), English divine, was born at Pickwell in Leicestershire. He was educated at St John's College, Cambridge, and successively held the livings of Islington (1662), of All-Hallows the Great, Thames Street, London (1679), and ofisleworth in Middlesex (1690). Dr Cave was chaplain to Charles II., and in 1684 became a canon of Windsor. The two works on which his reputation principally rests are the Apostoiçii, or History of Apostles and Fathers in the first three centuries of the Church (1677), and Scriptiorum Ecclesiasticorum Historia Literaria (1688). The best edition of the latter is the Clarendon Press, 1740-1743, which contains additions by the author and others. In both works he was drawn into controversy with the Rev. John Trenchard, who was then writing his Bibliothèque universelle, and who accused him of partiality. He wrote several other works of the same nature which exhibit scholarly research and lucid arrangement. He is said to have been a good talker and an eloquent preacher. His death occurred at Windsor on the 4th of July 1713.

CAVE (Lat. cavea, from cavus, hollow), a hollow extending beneath the surface of the earth. The word "cavern" (Lat. caverna) is practically a synonym, though a distinction is sometimes drawn between sea caves and inland caverns, but the term "cave" is used here as a general description. Caves have excited the awe and wonder of mankind in all ages, and have been the centres round which have clustered many legends and superstitions. They were the abode of the sibyls and the nymphs in Roman mythology, and in Greece they were the temples of Zeus, Pan, Dionysus, Pluto and the Moon, as well as the places where the oracles were delivered at Delphi, Corinth and Mount Cithaeron. In Persia they were connected with the obscure worship of Mithras. Their names frequently are survivals of the superstitious ideas of antiquity, as, for example, the Fairy, Dragon's, or Devil's Caves of France and Germany. Long after the Fairies and Little Men had forsaken the forests and glens of Germany, they dwell in their palaces deep in the Hartz Mountains, in the Dwarchales, &c., whence they came from time to time into the upper air.

The Seven Sleepers of Ephesus slept their long sleep in a cave. The hills of Granada are still believed by the Moorish children to contain the great Boabdil and his sleeping host, who will awake when an adventurous mortal invades their repose, to restore the glory of the Moors in Spain.

Caves have been used in all ages by mankind for habitation, refuge and burial. In the Old Testament we read that when Lot went up out of Zoar he dwelt in a cave with his two daughters. The five kings of the Canaanites took refuge from Joshua, and David from Saul, in the caves of Palestine, just as the Aquitani fled from Caesar to those of Auvergne, and the Arabs of Algeria to those of Dahra, where they were suffocated by Marshal Pelissier in 1845. In Central Africa David Livingstone discovered vast caves in which whole tribes found security with their cattle and household stuff.

The cave of Machpelah may be quoted as an example of their use as sepulchres, and the rock-hewn tombs of Palestine and of Egypt and the Catacombs of Rome probably owe their existence to the ancient practice of burial in natural hollows in the rock. We might therefore expect to find in them most important evidence as to the ancient history of mankind, which would reach long beyond written record; and since they have always
been used by wild beasts as lairs we might reasonably believe also that their exploration would throw light upon the animals which have in many cases disappeared from the countries which they formerly inhabited. The labours of Buckland, Pengelly, Falconer, Lartet and Christy, and Boyd Dawkins have added an entirely new chapter to the history of man in Europe, as well as established the changes that have taken place in the European fauna. The physical history of caves will be taken first, and we shall then pass on to the discoveries relating to man and the lower animals which have been made in them of late years.

**Physical History.**—The most obvious agent in hollowing out caves is the sea. The set of the currents, the force of the breakers, the grinding of the shingle inevitably discover the weak places in the cliff, and leave caves as one of the results of their work, modified in each case by the local conditions of the rock. Those formed in this manner are easily recognized from their floors being rarely much out of the horizontal; their entrances are all in the same plane, or in a succession of horizontal and parallel planes, if the land has been elevated at successive times. From their inaccessible position they have been rarely occupied by man. Among them Fingal’s Cave, on the island of Staffa, off the south-west coast of Scotland, hollowed out of columnar basalt, is perhaps the most remarkable in Europe. In volcanic regions elsewhere, the cavities have been formed by the action of water on the surface of the ground, or by the expansion of steam and gases in the lava while it was in a molten state. They have been observed in the regions round Vesuvius and Etna, in Iceland and Teneriffe. We may take as an example the Grotto del Cane (“cave of the dog”), near Pozzuoli, a few miles to the south-west of Naples, remarkable for the flow of carbonic acid from crevices in the floor, which fills the lower part of the cave and suffocates any small animal, such as a dog, immersed long enough in it.

The most important class of caves, however, and that which immediately demands our notice, is that composed of those which have been cut out of calcareous rocks by the action of carbonic acid in the rain-water, combined with the mechanical friction of the sand and stones set in motion by the streams which have, at one time or another, flowed through them. They occur at various levels, and are to be met with wherever the strata are sufficiently compact to support a roof. Those of Brixham and Torquay and of the Eifel are in the Devonian limestone; those of Wales, Somerset, the Pennine chain, Ireland, the central and northern counties of Belgium, Saxony, and Wurttemberg, in the Massif of Anjou and Auvergne, in Tuscany, and in that of the Carboniferous limestone. The cave of Kirkdale in Yorkshire, and most of those in Franconia and Bavaria, penetrate Jurassic limestones. The Neocomian and Cretaceous limestones contain most of the caverns of France, rendered famous by the discovery of the remains of the cave-men along with the animals which they hunted; as well as those of the Pyrenees, the Alps, Sicily, Greece, Dalmatia, Carniola and Palestine. The cave of Lunelviel near Montpellier is the most important of those which have been hollowed in limestones of the Tertiary age. They are also met with in rocks composed of gypsum; in Thuringia, for example, they occur in the saliferous and gypseous strata of the Zechstein, and in the gypseous Tertiary rocks of the neighbourhood of Paris, as, for example, at Montmorency.

Caves formed by the action of carbonic acid and the action of water are distinguished from others by the following characters. They open on the abrupt sides of valleys and ravines at various levels, and are arranged round the main axes of erosion, just as the branches are arranged round the trunk of a tree. In a great many cases the relation of the valley to the ravine, and of the ravine to the cave itself, is so intimate that it is impossible to deny that all three have been produced by the same causes. The caves themselves ramify in the same irregular fashion as the valleys, and are to be viewed merely as the capillaries in the general valley system through which the rain passes to join the main channels. Sometimes, as in the famous caves of Adelsberg, Kentuckty, Wook Shepherd Hole in Somersetshire, the Peak in Derbyshire, and in many in the Jura, they are still the passageways of subterranean streams; but very frequently the drainage has found an outlet at a lower level, and the ancient watercourses have been deserted. These in every case present unmistakable proof that they have been traversed by water in the sand, gravel and clay which they contain, as well as in the worn surfaces of the sides and bottom.

In all districts where there are caves there are funnel-shaped depressions of various sizes called pot-holes or swallow-holes, or bòtères, “chaldrons du diable,” “marmites des géants,” or “katavothra,” in which the rain is collected before it disappears into the subterranean passages. They are to be seen in all stages, some being mere hollows which only contain water after excessive rain, while others are profound vertical shafts into which water is continually falling. Gaping Ghyll, 330 ft., and Helin Pot in Yorkshire, 300 ft. deep, are examples of the latter class. The *cirques* described by M. Desnoyers belong to the same class as the swallow-holes.

The history of swallow-holes, caves, ravines and valleys in calcareous strata may be summed up as follows:—The calcareous rocks are invariably traversed by joints or lines of shrinkage, which are lines of weakness by which the direction of the drainage is determined; and they are composed to a large extent of carbonate of lime, which is readily exchanged into soluble bicarbonate by the addition of carbonic acid. The rain in its passage through the air takes up carbonic acid, and it is still more abundant in the atmosphere near volcanoes. It is thus possible for limestone to be dissolved by the rain falling upon it, there by decomposing vegetable matter. As the raindrops converge towards some one point, determined by some local accident on the surface, and always in a line of joint, the carbonic acid attacks the carbonate of lime with which it comes into contact, and thus a funnel is gradually formed ending in the vertical joint below. Both funnel and vertical joint below are being continually enlarged by this process. This chemical action goes on until the free carbonic acid is used up. The subterranean passages are enlarged in this manner, and what was originally an insignificant network of fissures is developed into a series of halls, sometimes as much as from 80 to 100 ft. high. These results are considerably furthered by the mechanical friction of the pebbles and sand hurled along by the current, and by falls of rock from the roof produced by the removal of the underlying strata.

In many cases the results of this action have produced a regular subterranean river system. The thick limestones of Kentucky, for example, are traversed by subterranean waters which collect in large rivers, and ultimately appear at the surface in full power. The river Axe, near Wells, the stream flowing out of the Peak Cavern, Castleton, those of Derbys and the solurn at Adel Coward, and the river Styx and the waters of Acheron disappear in a series of caverns which were supposed to lead down to the infernal regions.

If the direction of the drainage in the rock has been altered, either by elevations such as those with which the geologist is familiar, or by the opening out of new passages at a lower level, these watercourses become dry, and present us with the caves which have afforded shelter to man and the wild animals from the remotest ages, sometimes high up on the side of a ravine, at other times close to the level of the stream at the bottom.

Caves, as a general rule, are as little affected by disturbances of the rock as the ravines and valleys, which have been formed, in the main, irrespective of the lines of fault or dislocation. We must now examine what happens to the bicarbonate of lime which has been formed by the action of the acid on the limestone. If a current of air play upon the surface of the water, the carbonic acid, which floats up the lime, so to speak, is given off and the insoluble carbonate is deposited, and as a result of this action we have the elaborate and fantastic stony incrustations termed stalagmites and stalactites. As the water percolating through the rock covers the sides of the cavern with a stalactitic drapery, and if a line of drops persistently falls from the same point to the floor, the calcareous deposit gradually descends from the roof, forming in some cases stony tassels, and in others long columns which are ultimately united to the calcareous boss formed by the plash of the water on the floor. The surface also of the pools is sometimes covered over with an ice-like sheet of stalagmite, which shoots from the sides, and sometimes forms a
solid and firm floor when the water on which it was supported has disappeared. Sometimes the drops form a little calcareous basin, beautifully polished inside, which contains small pearl-like particles of carbonate of lime, polished by friction one against the other. The most beautiful stalactitic caves in Great Britain are those of Cheddar in Somerset, Caldy Island and Poole's Cavern at Buxton. A portion only of the carbonate of lime is thus deposited in the hollows of the rock from which it was taken; the rest is carried into the open air by the streams, in part deposited on the sides and bottom, forming tufa and the so-called petrifications, and partly being conveyed down to the sea to be ultimately secreted in the tissues of the Mulluscus, Echinodermata and Foraminifera. Through these it is again collected in a solid form, and in the long course of ages it is again lifted up above the level of the water as limestone rock, and again undergoes the same series of changes. Thus the cycle of carbonate of lime is a never-ending one from the land to the ocean, from the ocean to the land, and so it has been ever since the first stratum of limestone was formed out of the remains of the animals and plants of the sea.

The rate of accumulation of stalagmite in caverns is necessarily variable, since it is determined by the presence of varying currents of air. In the Ingleborough cavern a stalagmite, measured in 1829 at 1 ft. 11 in. and in 1873, 3 ft. 3 in., recorded the rate of growth in per annum.

It is obvious, therefore, that the vast antiquity of deposits containing remains of man underneath layers of stalagmite cannot be inferred from a thickness of a few inches or even of a few feet.

The intimate relation which exists between caves and ravines renders it extremely probable that many of the latter have been originally subterranean watercourses, which have been unroofed by the degradation of the rock. In all limestone districts ravines are to be found continued in the same direction as the caves, and the process of atmospheric erosion may be seen in the fallen blocks of stone which generally are to be met with at the mouths of the caverns. In illustration of this the valley and caves of Weathercote, in Yorkshire, may be quoted, or the source of the Axe at Wookey; and the ravine formed in this way has very frequently been widened out into a valley by the action of subaerial waste, or by the grinding of glaciers through it during the glacial stage of the Pleistocene period.

For further details as to the physical history of caverns we must refer the reader to the works quoted at the end of this article, by A. E. Day, J. Forbes, J. A. MacAlister, J. S. MacCulloch, H. M. Huxley, and J. E. McRae, and to the works of Dr. Rushton, including those of Great Britain and Ireland. The history of the Glaciers or Ice-caves will be found in Brown's Ice Caves in France and Switzerland.

Classification.—The caves which have offered shelter to the mammalia are classified according to their contents, and are of various ages, ranging from the Pliocene to the present day. (1) Those containing the Pliocene mammalia belong to that age. (2) Those with the remains of the mammoth, woolly rhinoceros and other extinct species, or with paleolithic man (see Archaeology), are termed Pleistocene. These are sometimes called Quaternary, under the mistaken idea that they belong to an age succeeding the Tertiary period. (3) Those which contain the remains of the domestic animals in association with the remains of man either in the Neolithic, Bronze or Iron stages of civilization are termed Prehistoric. (4) The fourth group consists of those which can be brought into relation with the historic period, and are therefore termed Historic.

The Pliocene Caves.—It is a singular fact, only to be explained by the volcanic formation of the surface on which the Pliocene Age has been deposited, that in some places the only cave referable to that age has as yet been discovered, that at Dovelenes near Buxton, Derbyshire, described by Boyd Dawkins in 1903 (Quart. Journ. Geol. Soc.). The cave consists of a large horizontal chamber and a small passage, connected with a swallow-hole close by, and exposed in the working face of a quarry in 1901, at a depth of about 40 ft. from the surface. The locality is in the limestone plateau, 1158 ft. high, which forms the divide between the waters flowing into the Mersey on the west and the Humber on the east. Both swallowhole and cave were completely blocked up with debris, and the latter was filled with red and yellow clay, horizontally stratified and containing pebbles of sandstone from the neighbouring ridge of Axe Edge, and bones and teeth of fossil mammals, some waterworn and others without traces of transport by water. All the mammals belong to well-known species found in the Pliocene strata of East Anglia, and in Aveugne and Italy. Among them were the sabre-toothed lion (Machairodus crenatidentis), the hyena of Aveugne, the mastodon, and the southern elephant (E. meridionalis), and rhinoceroses (R. Eurusus), and Steno’s horse. Most of the bones had evidently been gnawed by hyenas and accumulated in one of their dens, and had afterwards been carried by water into the chambers deep down in the rock, where they were found. Since that time the general level of the district has been lowered by denudation to an extent of more than 230 ft., and all the hyena dens destroyed with the Pliocene surface not only in this district but generally over the world. In this case a covering of limestone some 270 ft. thick, including the depth from the present surface, protected the remains from the denuding forces.

The Pleistocene Caves.—The search after ebur fossile or unicorns’ horn, or in other words the fossil bones which ranked high in the materia medica of the 16th and 17th centuries, led to the discovery of the ossiferous caverns of the Harz Mountains, and of Hungary and Bohemia. These districts were explored by Goldfuss in 1810. The bones of the hyena, lion, wolf, fox and stag, which it contained, were identified by Baron Cuvier, and some of the skulls have been proved by Busk to belong to the grizzly bear. They were associated with the bones of the reindeer, horse and bison, as well as with those of the great cave bear. These discoveries were of very great interest, because they established the fact that the above animals had lived in Germany in ancient times. The first bone cave systematically explored in England was one at Oreston near Plymouth in 1816, which proved that an extinct species of rhinoceros (R. leporinus) lived in that district. Four years later the famous hyena den at Kirkdale in Yorkshire was explored by Buckland. He brought forward proof that it had been inhabited by hyenas, and that the broken and gnawed bones of the mammoth, rhinoceroses, stag, bison and horse belonged to animals which had been dragged in for food. He pointed out that all these animals had lived in Yorkshire in ancient times, and that it was impossible for the carcasses of the rhinoceroses, hyena and mammoth to have been transported to the local regions into the cavities of the denuded foundations of bone caves in Derbyshire, South Wales and Somerset, as well as in Germany, and published his Reliquiae Diluvianae in 1822, a work which laid the foundations of the new science of cave-hunting in this country. The well-known cave of Kent’s Hole near Torquay furnished McEnery, between the years 1823 and 1841, with the first flint implements discovered in intimate association with the bones of extinct animals. He recognized the fact that they proved the existence of man in Devonshire while those animals were alive, but the idea was too novel to be accepted by his contemporaries. His discoveries have since been verified by the subsequent investigations carried on by Godwin Austen, and ultimately by the committee of the British Association, which worked for several years under the guidance of Pengelly. There are four distinct strata in the cave. 1st, The surface is composed of dark earth, and contains medieval remains, Roman pottery and articles which prove that it was in use during the Iron, Bronze and Neolithic Ages. 2nd, Below this is a stalagmitic floor, varying in thickness from 1 ft. to 3 ft., and covered by innumerable river stones, from which heathen tradition believed the hyena, lion, mammoth, rhinoceroses and other animals, in association with flint implements and an engraved antler, which proved man to have been an inhabitant of the cave during the time of its deposition. 3rd, Filling the bottom of the cave is a hard breccia, with the remains of bears and flint implements, in the main ruder than those found above; in some places it was no less than 1 ft. thick. The most remarkable animal found in Kent’s Hole is the sabre-toothed carnivore, Machairodus latidens of Owen. While the value of McEnery’s discoveries was in dispute the
The discoveries in Kent's Hole and in the Creswell caves prove further that palaeolithic man was in two stages of civilization—the ruder or river-drift man, with implements of the type found in the river gravels (see Archaeology; and Palæolithic) being the older; and the more highly advanced, or the cave-man, mainly characterized by the better implements, and a singular facility in depicting animal life (as shown by the figure of a horse incised on the fragment of a bone found in the Creswell caves), being the newer. We may also conclude from the absence of palaeolithic implements from the glaciated regions in which most of these caves occur, that both river-drift and cave-men dwelt in middle and northern Britain in the pre-glacial age, their remains being protected in the caverns from the denuding forces that removed all traces of their existence from the surface of the ground in glacial and post-glacial times. The river-drift man is, however, proved to be post-glacial in southern and eastern England, by the occurrence of his implements in the river gravels of that age. Both these peoples inhabited southern England and the continent before and after the glacial period. The river-drift man, whose implements occur in river deposits in middle and southern Europe, in Africa, Palestine and Hindustan, is everywhere in the same age of primitive barbarism, and has not as yet been identified with any living race. The cave-men are in a higher and more advanced stage, and led a life in Europe identical with that of the Eskimos in the Arctic regions.

The Pleistocene Caves of the European Continent.—The researches of Mortillet have proved that the same two groups of cave-dwellers occur in the caves of France, the older being represented by the Chelléen and Moustérien sections, and the newer by that of Solutré and La Madeleine. To the former belong the remains found in the caverns of Spy and Neanderthal, which prove that the river-drift man had "the most brutal of all known human skulls." To the latter we must assign all the caves and rock-shelters of Périgord, with the better implements, explored by Lartet and Christy in 1863-1864 in the valleys of the Vézère and Dordogne. These occur together in a picture of the life of the cave-men, and the revelation of Italian man, which was made in the 1st century by the buried cities of Herculanenum and Pompeii. The old floors of human occupation consist of broken bones of animals killed in the chase, mingled with rude implements and weapons of bone and unpolished stone, and with charcoal and burnt stones, which indicate the position of the hearths. Flakes without number, awls, lance-heads, hammerstones and saws made of flint rest pèle-mèle with bone needles, sculptured reindeer antlers, arrowheads and harpoons, and bones of the reindeer, horse, ibex, Saiga antelope and musk sheep. These singular accumulations of débris mark the places where the ancient hunters lived, and are merely the refuse cast aside. The reindeer formed by far the greater portion of the food, and must have lived in enormous herds at that time in the centre of France. From this, as well as from the presence of the most arctic of the herbivores, the musk sheep, we may infer the severe climate of that portion of France at that time. Besides these animals the cave bear and lion have been met with in one, and the mammoth in five localities, and their remains bear marks of cutting or scraping which showed they fell a prey to the hunters. The most remarkable remains left behind in these refuse heaps are the sculptured reindeer antlers and figures engraved on fragments of schist and on ivory. A well-defined outline of an ox stands out boldly from one piece of antler; a second represents a reindeer kneeling down in an easy attitude with his head thrown up in the air so that the antlers rest on the shoulders, and the back forms an even surface for a handle, which is too small to be grasped by an ordinary European man; in a third a man stands close to a horse's head, and on the other side of the same cylinder are two heads of bison drawn with sufficient clearness to ensure recognition by any one who has seen that animal. On a fourth the natural curvature of one of the times has been taken advantage of by the artist to engrave the head and the characteristic recurved horns of the ibex; and on a fifth horses are represented with large heads, upright dishevelled manes and shaggy ungroomed tails. The most striking figure is that of the mammoth engraved on a fragment of its own tusk; the peculiar spiral curvature of the tusk and the long mane, which are now not to be found in any living elephant, prove that the original was familiar to the eye of the artist. These drawings probably employed the idle hours of the hunter, and hand down to us the scenes which he witnessed in the chase. They are full of artistic feeling and are evidently drawn from life. The mammoth is engraved in its own ivory, and the reindeer and the stag on their respective antlers. Further researches have revealed the fact that in Auvergne and in the Pyrenees the cave-men ornamented some of their caves with incised figures and polychrome frescoes of the wild animals. Rivière has discovered on the walls of the grotto of La Mouthe (Dordogne) three large hunting scenes, one with bison and horses, a second representing a primitive hut, a bison, reindeer, ibex and mammoth, and a third with a fragment of a rhinoceros. In the Pyrenees similar frescoes have been described by Cartailhac and Breuil. They are on the walls of the cavern and roof of Altamira, and on the walls of Marsoulas. The outlines have been engraved first, and afterwards filled in with colour in brown and red ochre and black oxide of manganese.

The cave-men ranged over middle Europe as far south as the Pyrenees and the Alps, and inhabited the caverns of Belgium and Germany, Hungary and Switzerland. Their remains have not as yet been met with in southern Europe. They lived by hunting and fishing, they were fire users, and lit up the darkness of their caves with stone lamps filled with fat (Altamira). They were clad in skins sewn together with sinews of reindeer or strips of intestines. They used huts as well as caves for habitation. They had a marvellous facility for drawing animal figures. They possessed no domestic animals, nor were they acquainted with spinning or with the potter's art. We have no evidence that they buried their dead—the interments, such as those of Aurignac, Les Eyzies and Montene, most probably belonging to a later age. Their remains be compared with those of existing races, it will be found that the cave-men were in the same hunter stage of civilization as the Eskimos, and that they are unlike any other races of hunters. If they were not allied to the Eskimos by blood, there can be no doubt that they handed down to the latter their art and their manner of life. The bone needles, and many of the harpoons, as well as the flint spearheads, arrowheads and scrapers, are of precisely the same form as those now in use amongst the Eskimos. The artistic designs from the caves of France, Belgium and Switzerland, are identical in plan and workmanship with those of the Eskimos, with this difference only, that the hunting scenes familiar to the Palaeolithic cave-dwellers were not the same as those familiar to the inhabitants of the shores of the Arctic Ocean. Each represented the animals which he knew, and the whale, walrus and seal were unknown to the inland dwellers of Aquitaine, just as the mammoth, bison and wild horse are unknown to the Eskimos. The reindeer, which they both knew, is represented in the same way by both. The practice of accumulating large quantities of the bones of animals round their dwelling-places, and the habit of splitting the bones for the sake of the marrow, are the same in both. The hides were prepared with the same sort of instruments, and the needles with which they were sewn together are of the same pattern. The stone lamps were used by both. In both there was the same disregard of sepulture. All these facts can hardly be mere coincidences caused by both peoples leading a savage life under similar conditions. The conclusion, therefore, seems inevitable that, so far as we have any evidence of the race to which the cave-dwellers belong, that evidence points only in the direction
of the Eskimos. It is to a considerable extent confirmed by a consideration of the animals found in the caves. The reindeer and musk sheep afford food to the Eskimos now in the Arctic Circle, just as they afforded it to the cave-men in Europe; and both these animals have been traced by their remains from the Pyrenees to the north-east through Europe and Asia as far as the very regions in which they now live. The mammoth and bison also have been tracked by their remains in the frozen river gravels and morasses through Siberia as far as the American side of Bering Strait. Palaeolithic man appeared in Europe with the arctic mammals, lived in Europe with them, and in all human probability retreated to the north-east along with them. There are refuse heaps in north-eastern Siberia containing the remains of the mammoth and woolly rhinoceros as well as the reindeer and musk sheep, which may be referred with equal justice to the cave-men or to the Eskimos.

**Ancient Geography of Europe.**—The remains of man and the animals described in the preceding paragraphs have been introduced into the caves either by man or the wild beasts, or by streams of water, which may or may not now occupy their ancient courses; and the fact that the same species are to be met with in the caves of France, Switzerland and Britain implies that our island formed part of the continent, and that there were no physical barriers to prevent their migration from the Alps as far to the north-west as Ireland.

The same conclusion may be gathered from the exploration of caves in the south of Europe, which has resulted in the discovery of African species, in Gibraltar, Sicily and Malta. In the first of these the spotted hyena, the serval and Kafire cat lie side by side with the horse, grizzly bear and slender rhinoceros (R. lepiorrhinus)—see Falconer's *Palaeonigraphical Memoirs.* To these African animals inhabiting the Iberian peninsula in the Pleistocene age, Larret has added the African elephant and striped hyena, found in a stratum of gravel near Madrid, along with flint implements. The hippopotamus, spotted hyena and African elephant occur in the caves of Sicily, and imply that in ancient times there was a continuity of land between that spot and Africa, just as the presence of the *Elephas antiquus* proves the non-existence of the Straits of Messina during a portion, to say the least, of the Pleistocene age. A small species of hippopotamus (*H. Pennantii*) occurs in incredible abundance in the Sicilian caves. It has also been found in those of Malta along with an extinct pigmy elephant species (*E. Melitensis*). It has also been discovered in Candia and in the Peloponnese. For these animals to have found their way to these regions, a continuity of land is necessary. The view advanced by Dr Falconer and Admiral Spratt, that Europe was formerly connected with Africa by a bridge of land extending southwards from Sicily, is fully borne out by these considerations. The present geographical position of the Mediterranean has been produced by a depression of land to the amount of about 400 fathoms, by which the Sicilo-African and Ibero-African barriers have been submerged, and Crete and Malta separated from the South-European continent. It is extremely probable that this submergence took place at the same time that the adjoining sea-bottom was elevated to about the same amount so as to constitute that region now known as the Sahara.

**Pleistocene Caves of the Americas and Australia.**—The Pleistocene caverns of the Euro-Asiatic continent contain the progenitors of the animals now alive in some parts of the Old World, the extinct forms being closely allied to those now living in the same geographical provinces. Those of Brazil and of Pennsylvania present us with animals whose nearest analogues are to be found in North and South America, such as sloths, armadillos and agoutis. Those, again, of Australia present us with marsupials (metatheria) only allied to, or identical with, those of that most ancient continent. The extinct forms in each case are mainly those of the larger animals, which, from their large size, and low fecundity, would be specially liable to be beaten in the battle for life by their smaller and more fertile contemporaries, and less likely to survive those changes in their environment which have undoubtedly taken place in the long lapse of ages. It is, therefore, certain that the mammalian life in the Old, New and Australian worlds, was as well marked off into geographical provinces in the Pleistocene age as at the present time, and that it has been continuous in these areas from remote time to the present day.

**Prehistoric Caves of Neolithic Age in Europe.**—The prehistoric caves are distinguished from Pleistocene by their containing the remains of domestic animals, and by the wild animals to which they have afforded shelter belonging to living species. They are divisible into three groups according to the traces of man which occur in them—into the Neolithic, Bronze and Iron Ages.

The Neolithic caves are widely spread throughout Europe, and have been used as the habitations and tombs of the early races who invaded Europe from the East with their flocks and herds. The first of these systematically explored was at Perthis Chwarae, near the village of Llandegla, Denbighshire, in 1869. The following years five others were discovered close by, as well as a second group in the neighbourhood of Cefn on the banks of the Elwy. They contained polished celts, flint flakes, rude pottery and human skeletons, along with the broken bones of the pig, dog, horse, Celtic short horn and goat. The remains of the wild animals belong to the wolf, fox, badger, bear, wild boar, stag, roe, hare and rabbit. Most of the bones were broken or cut, and the whole group was obviously an accumulation which resulted from these caves having been used as dwellings. They had subsequently been used for burial. The human skeletons in them were of all ages, from infancy to old age; and the interments had been successive until each became filled. The bodies were buried in the contracted posture which is so characteristic of Neolithic interments generally. The men to whom these skeletons belonged were a short race, the tallest being about 5 ft. 6 in., and the shortest 4 ft. 10 in.; their skulls are orthogonathic, or not presenting jaws advancing beyond a vertical line dropped from the forehead, in shape long, oval, and of fair average capacity. The face was oval, and the cheek bones were not prominent. Some of the individuals were characterized by a peculiar flattening of the shinbone (platyctemism), which probably stood in relation to the free action of the foot that was not hampered by the use of a rigid sole or sandal. This, however, cannot be looked upon as a race character, or as a tendency towards a simian type of leg. These Neolithic cave-dwellers have been proved to be identical in physique with the builders of the cairns and tumuli which lie scattered over the face of Great Britain and Ireland. (See Thornam, *Crania Britannica.*) They have also been met with abundantly in France. In the Caverne de l’Homme Mort, for example, in the department of Lozère, explored in 1871, the association of remains was of precisely the same nature as those mentioned above, and the human skeletons were of the same small type. The same class of remains has also been discovered in Gibraltar, in the caves of Windmill Hill, and some others. The human remains examined by Busk are of precisely the same type as those of Denbighshire. In the work of Don Manuel Gongora J. Martinez (*Antiguedades prehistóricas de Andalasia*, 1868), several interments are described in the cave of Murcielagos, which penetrates the limestone out of which the grand scenery of the southern Sierra Nevada has been to a great extent carved. In one place a group of three skeletons was met with, one of which was adorned with a plain coronet of gold, and clad in a tunic made of esparto grass finely plaited, so as to form a pattern like that on some of the gold ornaments in Etruscan tombs. In a second spot farther within, twelve skeletons formed a semicircle round one covered with a tunic of skin, and wearing a necklace of esparto grass, ear-rings of black stone, and ornaments of shell and wild boar tusk. There were also articles of plated esparto grass, such as baskets and sandals. There were also flint flakes, polished-stone axes, implements of bone and wood, together with pottery of the same type as that from Gibraltar. The same class of remains have been discovered in the Woman’s Cave, near Alhama de Granada. From the physical identity of the human remains in all these cases it may be inferred that in the Neolithic Age a long-headed,
CAVE

small race inhabited the Iberian peninsula, extending through France, as far north as Britain, and to the north-west as far as Ireland—a race considered by Professor Busk, "to be at the present day represented by at any rate a part of the population now inhabiting the Basque provinces." This identification of the ancient Neolithic cave-dwellers with the modern Basque-speaking inhabitant of the western Pyrenees is corroborated by the elaborate researches of Broca, Virchow and Thurnam on modern Basque skulls. It may, therefore, be concluded that in the Neolithic Age an Iberian population occupied the whole of the area mentioned above, inhabiting caves and burying their dead in caves and chambered tombs, and possessed of the same habits of life. The remains of the same small, oval-shaped, long-headed race have been found in Belgium in the cave of Chauvaux, and they have been described by Sergi in southern Europe under the name of the Mediterranean race.

There is no evidence that any other race except the Iberian buried their dead in the caves of Britain in the Neolithic Age. In Belgium, however, the exploration of the cave of Schagneaux by Sorel proves that broad-headed men of the type defined by Huxley and Thurnam as brachycephalic, and characterized by high cheek-bones, prominent brows, and a large stature, the average height being 6 ft. 2 in. (Thurnam), inhabited and buried their dead in the caves of that region. In France they occur in the sepulchral cave of Orrouy (Oise) in association with those of the Iberic type. They have also been met with in Gibraltar. This type is undistinguishable from the Celtic (Goldelic) or Gaulish, found so abundantly in the chambered tombs of the Neolithic Age in France. Both these ancient races are represented at the present day by the Basques and Aquitanians of France and Spain, and by the Celts or Gauls of France, Britain and the Mediterranean border of Spain, their relative antiquity being proved by an appeal to their history and geographical distribution. For just as the earliest records show that the Iberic power extended as far north as the Loire, and as far east as the Rhone, so we have proof of the gradual retrocession of the Iberic frontier southwards, under the attacks of the successive Celtic hordes, until ultimately we find the latter in possession of a considerable part of southern Spain, forming by their union with the conquered the powerful nation of Celt-Iber. The Iberians were in possession of the country before they were dispossessed by the Goths, and at a later time by the Brythonians. They are recognized by Tacticus in Britain in the Silures of Wales; and they are still to be seen in the small, dark, lithe inhabitants of North Wales. The discovery of the characteristic skulls of both these races in the same family vault in the cave of Gop near Prestatyn, Flintshire, proves that the two races were mingled together in Britain as far back as the Bronze Age.

From the present distribution of this non-Aryan race it is obvious that they were gradually pushed back westward by the advance of tribes coming from the East, and following those routes which were subsequently taken by the Low and High Germans.

The exploration of the Grotta dei Colombi, in the island of Palmaria, overlooking the Gulf of Spezia, in 1873, proves that the stories scattered through the classical writers, that the caves on the Mediterranean shores were inhabited by cannibals, are not altogether without foundation. In it broken and cut bones of children and young adults were found along with those of the goat, hog, fox, wolf, wild-cat, flint flakes, bone implements and shells perforated for suspension.

Prehistoric Caves of Bronze and Iron Ages.—The extreme rarity of articles of bronze in the European caves implies that they were rarely used by the Bronze folk for habitation or burial. Bronze weapons mingled with gold ornaments have, however, been discovered in the Heatheryburn cave near Stanhope, Durham, as well as in those of Kirkhead in Carmyllie, in Thor's cave in Staffordshire, and the Cat's Hole in Gower in Glamorganshire. In the Iberian peninsula the cave of Catarina, explored by Signor Delgado, in the valley of the Tagus, contained bronze articles, associated with broken and cut human bones, as well as those of domestic animals, rendering it probable that cannibalism was practised in early times in that region. Busk believes, however, that the facts are insufficient to support the charge of cannibalism against the ancient Portuguese.

Caves containing articles of iron, and therefore belonging to that division of the prehistoric age, are so unimportant that they do not deserve notice in this place. As man increased in civilization he preferred to live in houses of his own building, and he no longer buried his dead in the natural sepulchres provided for him in the rock.

Prehistoric caves have been rarely explored in extra-European areas. Among those which abound in Palestine, one in Mount Lebanon, examined by Canon Tristram, contained flint implements along with charcoal and broken bones and teeth, some of which may be referred to a small ox, undistinguishable from the small short-horn, Bos longifrons. In North America the remains found by F. W. Putnam in the caves of Kentucky, consisting of moccasins, rudely-plaited cloth, and other articles, may be referred to the same division.

Historic Caves in Britain.—The historic caves have only attracted notice in fairly recent years, and in Britain alone, principally through the labours of the Settle Caving Committee from the year 1869 to the present day. To them is due the exploration of the Victoria cave, which had been discovered and partially investigated by Mr. Cartmell and others, and which was firmly occupied in the latter half of the 5th century. It consists of three large ill-defined chambers opening on the face of the cliff, 1450 ft. above the sea, and filled with débris very nearly up to the roof. It presented three distinct eras of occupation—one by hyenas, which dragged into it rhinoceroses, bisons, mammoths, horses, reindeer and bears. This was defined from the next occupation, which is probably of the Neolithic Age, by a layer of grey clay, on the surface of which rested a bone harpoon and a few flint flakes and bones. Then after an interval of débris at the entrance was a layer of charcoal, broken bones, fragments of old hearths, and numerous instruments of savage life associated with broken pottery, Roman coins, and the rude British imitations of them, various articles of iron, and elaborate personal ornaments, which implied a considerable development of the arts. The evidence of the coins stamps the date of the occupation of the cave to be between the first half of the 5th century and the English conquest. Some of the brooches present a peculiar flamboyant and spiral pattern in relief, of the type characteristic of the art of some of the illuminated manuscripts, as for example one of the Annals of Ulster, at Stockholm, and of the gospels of St Columban in Trinity College, Dublin. It is mostly allied to that work which is termed by Franks late Celtic. From its localization in Britain and Ireland, it seems to be probable that it is of Celtic derivation; and if this view be accepted, there is nothing at all extraordinary in its being recognized in the illuminated Irish gospels. Ireland, in the 6th and 7th centuries, was the great centre of art, civilization and literature; and it is only reasonable to suppose that there would be intercourse between the Irish Christians and those of the west of Britain, during the time that the Romano-Celts, or Brit-Welsh, were being slowly pushed westwards by the heathen English invaders. Proof of such an intercourse we find in the brief notice of the Annales Cambriae, in which Gildas, the Brit-Welsh historian, is stated to have sailed over to Ireland in the year A.D. 565. It is by no means improbable that about this time there was a Brit-Welsh migration into Ireland, as well as into Brittany. Objects with these designs found in Germany are probably directly or indirectly due to the Irish missionaries, who spread Christianity through those regions. The early Christian art in Ireland grew out of the late Celtic, and is to a great extent free from the influence of Rome, which is stamped on the Brit-Welsh art of the same age in this country.

Several other ornaments with enamel deserve especial notice. The enamel, composed of red, blue and yellow, has been inserted into the hollows in the bronze, and then heated so as to form a close union with it. They are of the same design as those which have been met with in late Roman tumuli in this country, and in places which are mainly in the north. They all belong to a class named late Celtic by Franks, and are considered by him to be of British manufacture. This view is supported by the only
reference to the art of enamelling furnished by the classical writers. Philostratus, a Greek sophist in the court of Julia Domna, the wife of the emperor Severus, writes, "It is said that the barbarians living in the ocean pour these colours (those of horse-trappings) on heated bronze, and that these adhere, grow as hard as stone, and preserve the designs that are made in them." It is worthy of remark that, since the emperor Severus built the wall which bears his name, marched in person against the Caledonians, and died at York, the account of the enamels may have reached Philostratus from the very district in which the Victoria Cave is situated.

Associated with these were bronze ornaments inlaid with silver, and miscellaneous iron articles, among which was a Roman key. Remains of this kind have been met with in the Albert and Kelko caves in the neighbourhood, in that of Dowker-bottom near Arncliffe, in that of Kirkhead on the northern shore of Morecambe Bay, in Poole's Cavern near Buxton, and in Thor's Cave near Ashbourne, and over a wide area ranging from Yorkshire and the Lake district southwards into Somerset and Devon.

It is obvious in all these cases that men accustomed to luxury and refinement were compelled, by the pressure of some great calamity, to flee for refuge to caves with whatever they could transport thither of their property. The number of spindle-whorls and personal ornaments imply that they were accompanied by their families. We may also infer that they were cut off from the civilization to which they had been accustomed, because in some cases they extemporized spindle-whorls out of fragments of Samian ware, instead of using those which were expressly manufactured for the purpose. Why the caves were inhabited is satisfactorily explained by an appeal to contemporary history. In the pages of Gildas, in the Anglo-Saxon Chronicle, and in the Annales Cambriae, we have a graphic picture of that long war of invasion by which the inhabitants of the old Roman province of Britannia were driven back by the Jutes, Angles and Saxons, who crossed over with their families and household stuff. Slowly, and in the chances of a war which extended through three centuries, they were gradually pushed back into Cumberland, Wales and West Somerset, Devon and Cornwall. While this war was going on the coinage became debased and Roman coins afforded the patterns for the small bronze minimi, which are to be met with equally in these caves and in the ruins of Roman cities. As the tide of war rolled to the west, the English tongue and, until towards the close of the struggle, the worship of Thor and Odin supplanted the British tongue and the Christian faith, and a rude barbarism replaced what was left of the Roman civilization in the island. It is to this period that relics of this kind in the caves must be assigned. They are traces of the anarchy of those times, and complete the picture of the desolation of Britain, revealed by the ashes of the cities and villas that were burnt by the invader. They prove that the vivid account given by Gildas of the straits to which his countrymen were reduced was literally true.

The shrines of Zeus in the Idaean and Dictaean caves have been explored by Halbherr and Orsi (Antichità dell' antro de Zeus Ideo) and by Arthur Evans and Hogarth (Journal of Hellenic Studies). These discoveries prove that the cult of Zeus began among the Mycenean peoples some 2000 years B.C. according to Evans, and was practised far down into the later Greek times. They show that the Greeks are indebted to the Mycenean peoples not only for their art, but for the chief of their divinities.

CAVEA, the Latin name given to the subterranean cellars in which the wild beasts were confined prior to the combats in the Roman arena. The term is sometimes applied to the amphitheatre (q.v.).

CAVEAT (Latin for "let him beware," from caveo), in law, a notice given by the party interested (caveator) to the proper officer of a court of justice to prevent the taking of a certain step without warning. It is entered in connexion with dealings in land registered in the land registry, with the grant of marriage licences, to prevent the issuing of a lunacy commission, to stay the probate of a will, letters of administration, &c. Caveat is also a term used in United States patent law (see PATENTS).

Caveat emptor ("let the buyer beware") is a maxim which implies that the responsibility for making a bad bargain over a purchase rests on the purchaser. In an ordinary contract for the sale of goods, there is no implied warranty or condition as to the quality or fitness for any particular purpose of the goods supplied, with certain exceptions, and, therefore, the buyer takes at his own risk. The maxim does not apply (a) where the buyer, expressly or by implication, makes known to the seller the particular purpose for which the goods are required, so as to show that the goods must be of a description that will answer the particular purpose required by the buyer; (b) where goods are bought by description from a seller who deals in goods of that description, for there is an implied condition that the goods are of merchantable quality, though if the buyer has actually examined the goods, there is no implied condition as regards defects which the examination ought to have revealed; (c) where the usage of trade annexes an implied warranty or condition to the goods as to their quality or fitness for a particular purpose. The maxim of caveat emptor is said to owe its origin to the fact that in early times sales of goods took place principally in market overt. (See further Sale of Goods.)

CAVEDONE, JACOPO (1577-1660), Italian painter, born at Sassuolo in the Modenese, was educated in the school of the Caracci, and under them painted in the churches of Bologna. His principal works are the "Adoration of the Magi," the "Four Doctors," and the "Last Supper"; and more especially the "Virgin and Child in Glory," with San Petronio and other saints, painted in 1614, and now in the Bolognese Academy. Cavedone became an assistant to Guido Reni in Rome, a fact which was generally of a subdued undemonstrative character, with rich Titanescque colouring. In his declining years his energies broke down after his wife had been accused of witchcraft, and after the death of a cherished son. He died in extreme poverty, in a stable at Bologna.

CAVENDISH, GEORGE (1500-1567), English writer, the biographer of Cardinal Wolsey, was the elder son of Thomas.
CAVENDISH, H.

Cavendish, clerk of the pipe in the exchequer, and his wife, Alice Smith of Padbrook Hall. He was probably born at his father's manor of Cavendish, in Suffolk. Later the family resided in London, in the parish of St Alban's, Wood Street, where Thomas Cavendish died in 1524. Shortly after this event George married Margery Kemp, of Spains Hall, an heiress, and the niece of Sir Thomas More. About 1527 he entered the service of Cardinal Wolsey as gentleman-usher, and for the next three years he was divided from his wife, children and estates, in the closest personal attendance on the great Cavendish. Cavendish was wholly devoted to Wolsey's interests, and also he saw in this appointment an opportunity to gratify his master-passion, a craving "to see and be acquainted with strangers, in especial with men in honour and authority." He was faithful to his master in disgrace, and showed the courage of the "loyal servitor." It is plain that he enjoyed Wolsey's closest confidence to the end, for after the cardinal's death George Cavendish was called before the privy council and closely examined as to Wolsey's latest acts and words. He gave his evidence so clearly and with so much natural dignity, that he won the applause of the hostile council, and the praise of being "a just, wise, and gentle servant." He was not allowed to suffer in pocket by his fidelity to his master, but retired, as it would seem, a wealthy man to his estate of Glemsford, in West Suffolk, in 1530. He was only thirty years of age, but his appetite for being acquainted with strange acts and persons was apparently sated, for we do not hear of his engaging in any more adventures. It is not to be doubted that Cavendish had taken down notes of Wolsey's conversation and movements, for many years passed before his biography was composed. At length, in 1557, he wrote it out in its final form. It was not, however, possible to publish it in the author's lifetime, but it was widely circulated in MS. Evidently one of these MSS. fell into Shakespeare's hands, for that poet made use of it in his King Henry VIII., although it is excessive to say, as Singer has done, that Shakespeare "merely put Cavendish's language into verse." The book was first printed in 1641, in a garbled text, and under the title of The Negotiations of Thomas Wolsey. The genuine text, from contemporary MSS., was given to the world in 1810, and more fully in 1815. Long before it was believed that the book was the composition of George Cavendish's younger brother William, the founder of Chatsworth, who also was attached to Wolsey. Joseph Hunter proved this to be impossible, and definitely asserted the claim of George. The latter is believed to have died at Glemsford in or about 1562. The intrinsic value of Cavendish's Life of Cardinal Wolsey has long been perceived, for it is the sole authentic record of a multitude of events highly important in a particularly interesting section of the history of England. Its importance as a product of biographical literature was first emphasized by Bishop Creighton, who insisted over and over again on the claim of Cavendish to be recognized as the earliest of the great English biographers and an individual writer of particular charm and originality. He writes with simplicity and with a certain vivid picturesque ness, rarely yielding to the rhetorical impulses which governed the ordinary prose of his age. (E. G. B.)

HENRY (1731-1800), English chemist and physicist, elder son of Lord Charles Cavendish, brother of the 3rd duke of Devonshire, and Lady Anne Grey, daughter of the duke of Kent, was born at Nice in October 1731. He was sent to school at Hackney in 1742, and in 1749 entered Peterhouse, Cambridge, which he left in 1753, without taking a degree. Until he was about forty he seems to have enjoyed a very moderate allowance from his father, but in the latter part of his life he was left a fortune which made him one of the richest men of his time. He lived principally at Clapham Common, but he had also a town-house in Bloomsbury, while his library was in a house in Dean Street, Soho; and there he used to attend on appointed days to lend the books to men who were properly vouched for. So methodical was he that he never took down a volume for his own use without entering it in the loan-book. He was a regular attendant at the meetings of the Royal Society, of which he became a fellow in 1760, and he dined every Thursday with the club composed of its members. Otherwise he had little intercourse with society; indeed, his chief object in life seems to have been to avoid the attention of his fellows. With his relatives he had little intercourse, and even Lord George Cavendish, whom he made his principal heir, he saw only for a few minutes once a year. His dinner was ordered daily by a note placed on the hall-table, and his women servants were instructed to keep out of his sight on pain of dismissal. In person he was tall and rather thin; his dress was old-fashioned and singularly uniform, and was inclined to be shabby about the times when the precisely arranged visits of his tailor were due. He had a slight hesitation in his speech, and his air of timidity and reserve was almost ludicrous. He was never married. He died at Clapham on the 24th of February 1810, leaving funded property worth £70,000, and a landed estate of £8000 a year, together with canal and other property, and £50,000 at his bankers.

Cavendish's scientific work is distinguished for the wideness of its range and for its extraordinary exactness and accuracy. The papers he himself published form an incomplete record of his researches, for many of the results he obtained only became generally known years after his death. Yet in spite of the absence of anything approaching self-advancement, he acquired a very high reputation within his own country and abroad, recognized by the Institute of France in 1803 when it chose him as one of its eight foreign associates. Arsenic formed the subject of his first recorded investigation, on which he was engaged at least as early as 1764, and in 1766 he began those communications to the Royal Society on the chemistry of gases, which are among his chief titles to fame. The first (Phil. Trans., 1766) consists of "Three papers containing experiments on Factitious Airs," dealing mostly with "inflammable air" (hydrogen), which he was the first to recognize as a distinct substance, and "fixed air" (carbon dioxide). He determined the specific gravity of these gases with reference to common air, investigated the extent to which they are absorbed by various liquids, and noted that common air containing one part in nine by volume of fixed air is no longer able to support combustion, and that the air produced by fermentation and putrefaction of many substances is identical with those of fixed air obtained from marble. In the following year he published a paper on the analysis of one of the London pump-waters (from Rathbone Place, Oxford Street), which is closely connected with the memoirs just mentioned, since it shows that the calcareous matter in that water is held in solution by the "fixed air" present and can be precipitated by lime. Electrical studies seem next to have engaged his attention, and in 1771 and 1772 he read to the Royal Society his "Attempt to explain some of the principal phenomena of electricity by an elastic fluid," which was followed in 1775 by an "Attempt to imitate the effects of the Torpedo (a fish allied to the ray)" (Phil. Trans., 1776). But these two memoirs contain only a part of the electrical researches he carried out between 1771 and 1781, and many more were found after his death in a number of sealed packets of papers. The contents of these for a long time remained unknown, but ultimately by permission of the duke of Devonshire, to whom they belonged, they were examined by James Clerk Maxwell and published in 1879 by the Cavendish Laboratory. The Electric Researches of the Hon. Henry Cavendish. About 1777 or 1778 he resumed his pneumatic inquiries, though he published nothing on the subject till 1783. In that year he described a new eudiometer to the Royal Society and detailed observations he had made to determine whether or not the atmosphere is constant in composition; after testing the air on nearly 60 different days in 1781 he could find in the proportion of oxygen no difference of which he could be sure, nor could he detect any sensible variation at different places. Two papers on "Experiments with Airs," printed in the Phil. Trans. for 1784 and 1785, contain his great discoveries of the compound nature of water and the composition of nitric acid. Starting from an experiment, narrated by Priestley, in which John Warltire fired a mixture of common air and hydrogen by electricity, with the result that there was a diminution of volume and a deposition of moisture,
CAVENDISH, T.—CAVENDISH, SIR W.

Cavendish burnt about two parts of hydrogen with five of common air, and noticed that almost all the hydrogen and about one-fifth of the common air lost their elasticity and were condensed into a dew which lined the inside of the vessel employed. This dew he judged to be pure water. In another experiment he fired, by the electric spark, a mixture of hydrogen and oxygen (dephlogistated air), and found that the resulting water contained nitric acid, which he argued must be due to the nitrogen present as an impurity in the oxygen. This was confirmed by Cavendish's later experiments, which showed that when electric sparks are passed through common air there is a shrinkage of volume owing to the nitrogen uniting with the oxygen to form nitric acid. Further, remarking that little was known of the phlogistated air peculiar to our atmosphere, Cavendish decided whether the whole of a given portion of nitrogen (dephlogistated air) of the atmosphere could be reduced to nitric acid. He found that a small fraction, not more than 1/8th part, resisted the change, and in this residue he doubtless had a sample of the inert gas argon which was only recognized as a distinct entity more than a hundred years later. His last chemical paper, published in 1788, on the "Conversion of a mixture of dephlogistated and phlogistated air into nitrous acid by the electric spark," describes measures he took to authenticate the truth of the experiment described in the 1785 paper, which had "since been tried by persons of distinguished ability in such pursuits without success." It may be noted here that, while Cavendish adhered to the phlogistic doctrine, he did not hold it with anything like the tenacity that characterized Priestley; thus, in his 1785 paper on "Experiments upon Air," he remarks that not only the experiments he is describing, but also "most other phenomena of nature seem capable of explanation as well as nearly as well," upon the Lavoisierian view of the commonly believed principle of phlogiston, and he goes on to give an explanation in terms of the antiphlogistic hypothesis.

Early in his career Cavendish took up the study of heat, and had he promptly published his results he might have anticipated Joseph Black as the discoverer of latent heat and of specific heat. But he made no reference to his work till 1783, when he presented to the Royal Society some "Observations on Mr. Hutchins' experiments for determining the degree of cold at which quicksilver freezes." This paper, with others published in 1786 and 1788, is concerned with the phenomena attending the freezing of various substances, and is noteworthy because in it he expresses doubt of the supposition that "the heat of bodies is owing to their containing more or less of a substance called the matter of heat," and inclines to Newton's opinion that "it consists in the internal motion of the particles of bodies." His "Account of the Meteorological Apparatus used at the Royal Society's House" (Phil. Trans., 1776) contains remarks on the precautions necessary in making and using thermometers, a subject which is continued in the following year in a report signed by him and six others.

Cavendish's last great achievement was his famous series of experiments to determine the density of the earth (Phil. Trans., 1798). The apparatus he employed was devised by the Rev. John Michell, though he had the most important parts constructed to his own designs; it depended on measuring the attraction exercised on a horizontal bar, suspended by a vertical wire and bearing a small lead ball at each end, by two large masses in vacuo (See Gravitation.) The figure he gives for the specific gravity of the earth is 5.48, water being 1, but in fact the mean of the 29 results he records works out at 5.448. Other publications of his later years dealt with the height of an aurora seen in 1784 (Phil. Trans., 1790), the civil year of the Hindus (Id. 1792), and an improved method of graduating astronomical instruments (Id. 1809). Cavendish also had a taste for geology, and made several tours in England for the purpose of gratifying it.

A life by George Wilson (1818-1859), printed for the Cavendish Society in 1851, contains an account of his writings, both published and unpublished, together with a critical inquiry into the claims of all the alleged discoverers of the composition of water. Some of his instruments are preserved in the Royal Institution, London, and his name is commemorated in the Cavendish Physical Laboratory at Cambridge, which was built by his kinsman the 7th duke of Devonshire.

CAVENDISH [Candish], THOMAS (1552—1592), the third circumnavigator of the globe, was born at Trimley St Martin, Suffolk. On quitting Corpus Christi College, Cambridge (without a degree), he almost ruined himself by his extravagance as a courtier. To repair his fortune he turned to maritime and colonial enterprise, and in 1583 accompanied Sir Richard Grenville to America. Soon returning to England, he undertook an elaborate imitation of Drake’s great voyage. On the 21st of July 1586, he sailed from Plymouth with 123 men in three vessels, only one of which (the "Desire," of 140 tons) came home. By way of Sierra Leone, the Cape Verde Islands and C. Frio in Brazil, he coasted down to Patagonia (where he discovered "Port Desire," his only important contribution to knowledge), and passing through Magellan’s Straits, fell upon the Spanish settlements and shipping on the west coast of South and Central America and of Mexico. Among his prizes were nineteen vessels of worth, and especially the treasure-galleon, the Great St Anne," which he captured off Cape St Lucas, the southern extremity of California (November 14, 1587). After this success he struck across the Pacific for home, touched at the Ladrones, Philippines, Moluccas and Java, rounded the Cape of Good Hope; and arrived again at Plymouth (September 9-10, 1588), having circumnavigated the globe in two years and fifty days. It is said that his sailors were clothed in silk, their sails were damask, and his topmast covered with cloth of gold. Yet by 1591 he was again in difficulties, and planned a fresh American and Pacific venture. John Davis (q.v.) accompanied him, but the voyage (undertaken with five vessels) was an utter failure, much of the fault lying with Cavendish himself, who falsely accused Davis, with his last breath, of deserting him (May 20, 1592). He died and was buried at sea, on the way home, in the summer of 1592.

CAVENDISH, SIR WILLIAM (c. 1595—1537), founder of the English noble house of Cavendish, was the younger brother of George Cavendish (q.v.). His father, Thomas, was a descendant of Sir John Cavendish, the judge, who in 1581 was murdered by Jack Straw’s insurgent peasants at Bury St Edmunds. Of William’s education nothing seems known, but in 1530 he was appointed vicar of the parish for visiting monasteries; he worked directly under Thomas Cromwell, whom he calls "my master," and to whom many of his extant letters are addressed. In 1541 he was auditor of the court of augmentations, in 1546 treasurer of the king’s chamber, and was knighted and sworn of the privy council. Under Edward VI and Mary he continued in favour at court; during the latter’s reign he partially conformed, but on the occasion of the war with France he with other Derbyshire gentlemen refused the loan of £100 demanded by the queen. He died in 1557. Cavendish acquired large properties from the spoils of the monasteries, but in accordance with the wish of his third wife Elizabeth he sold them to purchase land in Derbyshire. This wife was the celebrated "building Bess of Hardwick," daughter of John Hardwicke, of Hardwicke, Derbyshire; she completed the original building of Chatsworth House,—begun in 1552 by her husband,—of which nothing now remains. Her fourth husband was George Talbot, 6th earl of Shrewsbury. By her Cavendish had six children; an eldest son who died without issue; William, who in 1618 was created earl of Devonshire; Charles, whose son William became 1st duke of Newcastle;
Frances, who married Sir Henry Pierpont, and was the ancestress of the dukes of Kingston; Elizabeth, who married Charles Stuart, earl of Lennox; and was the mother of Arabella Stuart; and Mary, who married Gilbert Talbot, 7th earl of Shrewsbury.

CAVETTO (Ital. diminutive of cavo, hollow), in architecture, the term given to a hollow concave moulding sometimes employed in the place of the cymatium of a cornice, as in that of the Doric order of the theatre of Marcellus. It forms the crowning feature of the Egyptian temples, and took the place of the cymatium in many of the Etruscan temples.

CAVIARE, or CAVAR, the roe of various species of Acipenser or sturgeon (q.v.), prepared, in several qualities, as an article of food. The word is common to most European languages and supposed to be of Turk or Tartar origin, but the Turk word khasyak is probably derived from the Ital. caviale; the word does not appear in Russian. The best caviare, which can only be made in winter and is difficult to preserve, is the loosely granulated, almost liquid, kind, known in Russia as ikra. It is prepared by beating the ovaries and straining through a sieve to clear the eggs of the membranes, fibres and fatty matter; it is then salted with from 4-5% of salt. The difficulty of preparation and of transport has made it a table delicacy in western Europe, where it has been known since the 17th century. By H. C. "His pleasure was not the million, 'twas caviare to the general." It is eaten either as an hors d'oeuvre, particularly in Russia and northern Europe with kummel or other liqueurs, or as a savoury, or as a flavouring to other dishes. The coarser quality, in Russia known as pajusnaya (from pajus, the adherent skin of the ovaries), is more strongly salted in brine and is pressed into a more solid form than the ikra; it is then packed in small barrels or hermetically-sealed tins. This forms a staple article of food in Russia and eastern Europe. Though the best forms of caviare are still made in Russia, and the greater quantity of the coarser kinds are exported from Astrakhan, the centre of the trade, larger amounts are made each year for export in America and also in Germany, Norway and Sweden. The roe of tuna and mullet, pickled in brine and vinegar, is used, under the name of "Botargo," along the Mediterranean littoral and in the Levant.

CAVITE, a fortified seaport, the capital of the province of Cavite, Luzon, Philippine Islands, and the seat of the principal Asiatic naval station of the United States, on a forked tongue of land in Manila Bay, 8 m. S. of the city of Manila. Pop. (1905) 4494; Paco, the old Spanish and Caridad (or San Roque and Caridad del Pilar), which are under the municipal government of Cavite (15,020). Cavite is the terminus of a railway which follows the shore of the bay from Manila. The northern part of the town, Sangley Point (one of the two forks of the main peninsula), is the principal coaling station of the U.S. fleet in Asiatic waters. The naval station proper and the old town of Cavite are on the south fork of the peninsula. Cavite's buildings are mostly of stone, with upper storeys of wood; its streets are narrow and crooked. It has five churches (one of these is an independent Filipino church), and is the seat of a provincial high school. Cavite has long been the principal naval base of the Philippine Islands, and one of the four Spanish penitentiaries in the Islands was here. During the 19th century Cavite was the centre of political disturbances in the Philippines; in 1896 on the parade ground thirteen political prisoners were executed, and to their memory a monument was erected in 1906 at the head of the isthmus connecting with the main peninsula. The town was nearly destroyed by an earthquake in 1886. It was taken from the Spanish by an American naval expedition under Commodore C. H. Davis, May 8, 1898.

CAVOUR, CAMILLO BENSO, COUNT (1810-1861), Italian statesman, was born at Turin on the 1st of August 1810. The Benso, who belonged to the old Piedmontese feudal aristocracy, were a very ancient house, said to be descended from a Saxon warrior who settled at Santana in the 12th century and married a Piedmontese heiress; Camillo's father, the marquis Michele, married a noble Genevese lady, and both he and his wife held offices in the household of Prince Borghese, the governor of Piedmont under Napoleon, and husband of the latter's sister, Pauline Bonaparte. Being a younger son (his brother Gustavo was the eldest) Cavour was destined for the army, and when ten years old he entered the military academy at Turin. On leaving the college at the age of sixteen he was first of his class, and received a commission in the engineers. He spent the next five years in the army, residing at Ventimiglia, Genoa, and various Alpine fortresses to superintend defence works; but he spent his leisure hours in study, especially of the English language. He soon developed strong marked Liberal tendencies and an uncompromising dislike for absolutism and clericalism, which, as he had not acquired the art of reticence, made him a suspect in the eyes of the police and of the reactionaries; at the same time he does not seem to have joined any secret society, for he was too loyal to conspire against the king whose uniform he wore, and he did not believe that the time was yet ripe for a revolution. But after the accession to the throne of Charles Albert, whom he always distrusted, he felt that his position in the army was intolerable, and resigned his commission (1831). From that moment we find him in the ranks of the opponents of the government, although his was always a loyal and straightforward opposition which held aloof from conspiracies. During the next few years he devoted himself to the study of political and social problems, to foreign travel, and to acquiring a thorough knowledge of practical methods of government. He was strongly influenced by the July revolution of 1830 in France, which proved that an historic monarchy was not incompatible with Liberal principles, and he became more than ever convinced of the benefits of a constitutional monarchy as opposed both to despotism and to republicanism. But he was not affected by the doctrinaire Liberalism of the time, and his views were strengthened by his studies of the British constitution, of which he was a great admirer; he was even nicknamed "Milord Camillo." He frequently visited Paris and London, where he plunged into the political and social questions of the day, and contributed among other essays two admirable and prophetic articles, one on the Irish question, in which he strongly defended the Union, and also on the Corn Laws. He applied his knowledge of agriculture to the management of his father's estate at Lerì, which he greatly improved, he founded the Piedmontese Agricultural Society, and took the lead in promoting the introduction of steam navigation, railways and factories into the country.

Thus his mind gradually evolved, and he began to dream dreams of a united Italy free from foreign influence, but owing to the tenacity of the political party of the Piedmontese government to take any active part in politics. In 1847, however, the psychological moment seemed to have arrived, for the new pope, Pius IX., showed marked Liberal tendencies and seemed ready to lead all the forces of Italian patriotism against the Austrian domination. The hopes of the Italian Liberals rose high and the so-called neo-Guelph party, represented by such men as Vincenzo Gioberti and Cesare Balbo, believed that an Italian confederation might be formed under the presidency of the pope. Cavour, although he realized that a really Liberal pope was an impossi bility, saw the importance of the movement and the necessity of profiting by it. Together with Balbo, P. di Santa Rosa, and M. Castelli, he founded a newspaper at Turin called Il Risorgimento, which advocated the ideas of constitutional reform in Piedmont, with a view to preparing that country for an important role in the upheaval which seemed imminent. In January 1848 the revolution first broke out in Sicily. Cavour, in a speech before a delegation of journalists, declared that the king must take a decided line and grant his people a constitution. Strong pressure was brought to bear on Charles Albert, and after much hesitation he yielded and was released from the charge of liberties (February 8, 1848). Cesare Balbo was called upon to form the first constitutional ministry; but Cavour was not offered a seat in it, being suspected by Liberals and Conservatives alike. He continued his journalistic activity, and his articles in the Risorgimento came to exercise great influence both on the king and on public opinion. When the news of the revolt of the Milanese against the Austrians, known as the Five Days, reached Turin on the 19th of March, Cavour felt that the time for Piedmont to act with energy had come, and advocated war against Austria. "After deliberately weighing
CAVOUR 583

led to a split between that statesman and Cavour, and to the latter's resignation. Cavour has been blamed for not informing his colleagues of the compact, but for public reasons it was not desirable that the _comunio_ should be discussed before it was consummated. D’Aezeglio indeed bore no malice, and remained Cavour's friend. Cavour made use of his freedom to visit England and France again, in order to sound public opinion on the Italian question. In London he found the leaders of both parties friendly, and Lord Palmerston told him that if the constitutional experiment in Piedmont succeeded the Italian despot's were doomed. At this time Sir James Hudson was appointed British minister at Turin, where he became the intimate friend of Cavour and gave him valuable assistance. In Paris, Cavour had a long interview with Prince Louis Napoleon, then president of the republic, and he already foresaw the great part which that ruler was destined to play in Italian affairs. He also met several Italian exiles in France.

On Cavour's return he found the country in the throes of a new cabinet crisis, in consequence of which, on d’Aezeglio's recommendation, he was invited to form a ministry. By the 4th of November he was prime minister, a position which he held with increasing distinction for the next few years. In the first year of his premiership to developing the economic resources of the country; but in preparing it for greater destines, he had to meet the heavy expenditure by increased taxation, and some of his measures made him the object of hostile demonstrations, although he soon outlived his unpopularity. Cavour's first international difficulty was with Austria; after the abortive rising at Milan in February 1853, the Austrian government, in addition to other measures of repression, confiscated the estates of those Lombards who had become naturalized Piedmontese, although they had nothing to do with the outbreak. Cavour took a strong line on this question, and on Austria's refusal to withdraw the obnoxious decree, he recalled the Piedmontese minister from Vienna, thus by his very audacity winning the sympathy of the Western powers.

Then followed the Crimean War, in which Cavour first showed his extraordinary political insight and diplomatic genius. The first suggestion of Piedmontese co-operation is usually believed to have come from England, who desired the Italian contingent, not only as material assistance, but also to represent the government of France in the French armies. From the Piedmontese point of view there were several reasons why Cavour should desire his country to participate in the campaign. Firstly, it was advisable to use every opportunity of making the Italian question an international one; secondly, by joining the alliance Piedmont would place the Western powers under an obligation; thirdly, Cavour, like Balbo, believed that the Italian question was bound up with the Eastern problem, and as Austria was demanding the permission of the powers to occupy Alessandria, as a guarantee that Piedmont would not profit by the war in the East to create trouble in Italy, Piedmontese participation would in itself prove the best guarantee; and finally, as he always looked to Italy and not merely to Piedmont, he felt that, having proved to Europe that Italians could combine order with liberty, it remained to show that they were capable of fighting as well. But there were serious difficulties in the way. Had Austria joined the allies, as at one time seemed probable, Sardinia's position fighting by her side would have been an impossible one. On the other hand, Piedmont could not demand immediate participation, because to reduce the crimean war to the status of a question as some politicians desired, because these would never have been given, lest Austria should be offended and driven into the arms of Russia. Then, both the extreme Conservatives and the extreme Radicals were opposed to expenditure on foreign adventures for which they could see no use. In all these difficulties, however, Cavour was loyally supported by the king, who saw the advantages of Piedmontese participation, even if unattended by definite promises. General Dabormida, the minister of foreign affairs, disapproved of this policy and resigned. The vacant portfolio was offered to d’Aezeglio, who refused it; whereupon Cavour assumed it himself. On the same
Cavour

day (January 10, 1855) the treaty with France and England was signed, and shortly afterwards 15,000 Piedmontese troops under General La Marmora were despatched to the Crimea.

Events at first seemed to justify the fears of Cavour's opponents. Cholera attacked the Piedmontese soldiers, who for a long time had no occasion to distinguish themselves in action; public opinion became despondent and began to blame Cavour, and even he himself lost heart. Then came the news of the battle of the Chaterna, fought and won by the Italians, which turned sadness and doubt into jubilation. Joy was felt throughout Italy, especially at Milan, where the victory was the first sign of daylight amid the gloom caused by the return of the Austrians. Everyone realized that the Piedmontese contingent was fighting Italy's battles. But to Cavour the announcement that Russia had accepted Austrian mediation (January 16, 1856) was a great disappointment. He had always hoped that if the war continued Austria would be forced to side with Russia in return for the aid given by the emperor Nicholas in suppressing the Hungarian revolt in 1849, and the Western powers would then have an opportunity of helping the Italian cause. He sent a memorandum, at Napoleon's request, to Count Walewski, the French minister of foreign affairs, setting forth a kind of minimum programme of Piedmont's claims. On the summoning of the congress of Paris at the conclusion of the war, Cavour first proposed that d' Azeglio should represent Piedmont, and on the latter's refusal decided to go himself. After much discussion, and in spite of the opposition of Austria, who as mediator occupied a predominant position, behaving "as though she had taken Sevastopol," Cavour obtained that Piedmont should be treated as one of the great powers. Although he did not expect that the congress would liberate Italy, yet by his marvellous diplomatic skill, far superior to that of his colleagues, he first succeeded in isolating Austria, secondly in indirectly compromising Napoleon in the Italian question, and thirdly in getting the wretched conditions of Italy discussed by the representatives of the great powers, who declared that some remedy to that state of things was necessary, not in the interests of Italy alone, but of all Europe. A scheme of reform proposed by Count Walewski gave Cavour the opportunity to plead the Italian cause, and from that moment it was manifest to all that the liberation of Italy was personified in him, the statesman who came to hold all the strings of European politics in his hands.

Cavour's chief measure of internal reform during this period was a bill for suppressing all monastic orders unconnected with education, preaching or charity; this aroused strong opposition from the extremists of both parties and also from the king, and led to the minister's resignation. But he was soon recalled, for the country could not do without him, and the bill was passed (May 29, 1855).

Cavour now saw that war with Austria was merely a question of time, and he began to establish connexions with the revolutionists of all parts of Italy, largely by means of La Farina; but it was necessary that this policy should not be advertised to Europe, and he strongly disavowed Mazzini's abortive revolutionary attempts. He continued to strengthen Piedmont's military resources, and the army soon grew too large for the country and was obviously destined for more than merely defensive purposes. But he well knew that although Piedmont must be made as efficient as possible from the military point of view, it could not defeat Austria single-handed. He would have preferred an alliance with Great Britain, who would never demand territorial compensation; but although British sympathies were wholly Italian, the government was desperately anxious to avoid war. From Napoleon more was to be hoped, for the emperor still preserved some of his revolutionary instincts, while the insecurity of his situation at home made him eager to gain popularity by winning military glory abroad; but he still hesitated, and Cavour devoted the whole of his ability to overcoming his doubts. In the midst of these negotiations came Orsini's attempt on Napoleon's life (January 14, 1858), which threatened to alienate his Italian sympathies and cause serious embarrassments to Piedmont. But after some remonstrances to Piedmont for not acting with sufficient energy against the revolutionists, the incident was settled; and Napoleon, in any case, could not have helped the Italian cause more such attempts would be made. A month after the Orsini outrage he laid before Cavour a proposal for a Franco-Piedmontese alliance and the marriage of Prince Jerome Bonaparte with Princess Clothilde, the daughter of Victor Emmanuel.

An "accidental" meeting between Napoleon and Cavour was arranged and took place at Plombières in July, and although no one knew what passed, the news of it fell like a bombshell on the diplomatic world. No definite treaty was signed, but the basis of an agreement was laid, whereby France and Piedmont were to declare war against Austria with the object of expelling her from Italy, and a north Italian state was to be formed; in exchange for this help France was to receive Savoy and possibly Nice. But the emperor still hesitated, and refused to decide on war unless Austria attacked Piedmont; the British government, too, in its anxiety to preserve peace, was not very friendly to the Italian cause. Cavour saw that the only way to overcome all these obstacles was to force Austria's hand. The fact was that the danger lest an Italy freed by French arms should be overwhelmed under French predominance; for this reason Cavour was determined to secure the co-operation of volunteers from other parts of Italy, and that the war should be accompanied by a series of risings against Austria and the local despots. It was also necessary that the risings should break out in the various provinces before the Piedmontese and French troops arrived, so that the latter should not appear as invaders and conquerors, but merely as liberators.

The moment war was seen to be imminent, parties of Italians of all classes, especially Lombards, poured into Piedmont to enlist in the army. Cavour also had a secret interview with Garibaldi, with whom he arranged to organize volunteer corps so that the army should be not merely that of Piedmont, but of all Italy. Every day the situation grew more critical, and on the 10th of January 1859 the king in his speech from the throne pronounced the memorable words "that he could not remain deaf to the cry of pain (il grido di dolore) that reached him from all parts of Italy"—words which, although actually suggested by Napoleon, rang like a trumpet-call throughout the land. In the meanwhile the marriage negotiations were concluded, and during the emperor's visit to Turin a military convention was signed between the two states, and Savoy and Nice were promised to France as a reward for the expulsion of the Austrians from Italy. But the British government was still unfavourable, and Napoleon, ever hesitating, again sought an excuse for backing out of his engagements; he jumped at the Russian proposal to settle the Italian question by means of his own favourite expedient, a congress. To this Austria agreed on condition that Piedmont should disarm and should be excluded from the congress; England supported the scheme, but desired that all the Italian states should be represented. Cavour was in despair at the turn events were taking, and appealed to Napoleon, actually threatening to emigrate to America and publish all his correspondence with the emperor if the latter did not keep his engagements. He decided at last most reluctantly to accept the English proposal, lest Piedmont should be abandoned to all, but clung to the hope that Austria would reject it. On the 19th of April the Austrian emperor, on the advice of the military party, did reject it; and on the 23rd, to Cavour's inexpressible joy, Austria sent an ultimatum demanding the disarmament of Piedmont. Cavour replied that his government had agreed to the congress proposed by the powers and that it had nothing more to say. On quitting the chamber that day he said to a friend: "I am leaving the last sitting of the last Piedmontese parliament"—the next would represent united Italy. France now allied herself definitely with Piedmont, and England, delighted at Cavour's acquiescence to her own proposal and enraged by Austria's ultimatum, became wholly friendly to the Italian cause. A few days later Austria declared war.
As La Marmora now took the chief command of the army, Cavour added the ministry of war to the others he already held. His activities at this time were astounding, for he was virtually dictator and controlled single-handed nearly all the chief offices of the state. The French troops entered Piedmont, where they were received with enthusiasm, and the allies marched into Lombardy; the victory of Magenta, which opened the gates of Milan to them, was shortly followed by that of Solferino. The people rose in arms at Parma, Modena, Florence and Bologna, which had been occupied by Austria for the pope since 1849; the local princes were expelled and provisional governments set up. Cavour sent special commissioners to take charge of the various provinces in Victor Emmanuel's name. But these events, together with Prussia's menacing attitude, began to alarm Napoleon, who, although he wished to destroy Austrian influence in Italy, was afraid of a large and powerful Italian state. Consequently, after Solferino, he concluded an armistice with Austria at Villarfranca on the 8th of July, without previously informing Cavour. When Cavour heard of it he was thunderstruck; he immediately interviewed the king at Monzambano, and in violent, almost disrespectful language implored him not to make peace until Venice was free. But Victor Emmanuel saw that nothing was to be gained by a refusal, and much against his own inclination, signed the peace preliminaries at Villarfranca, adding the phrase, "pour ce qui me concerne," which meant that he was not responsible for what the people of other parts of Italy might do (July 12). Lombardy was to be ceded to Piedmont, Venetia to remain Austrian, the deposed princes to be reinstated, and the pope made president of an Italian confederation.

The cabinet resigned the next day, but remained in office provisionally, and Cavour privately advised the revolutionists of central Italy to resist the return of the princes, by force if necessary: "for we must now become conspirators ourselves," he said. His policy was thus continued after he left office, and Palmerston, who had meanwhile succeeded Malmesbury as foreign minister, informed France and Austria that Great Britain would never tolerate their armed intervention in favour of the central Italian despots. The new Piedmontese ministry, of which La Marmora was the president, but Rattazzi the leading spirit, hesitated between annexing central Italy and agreeing to the terms of peace, but on the 8th of November peace was signed at Zürich. Napoleon proposed a new congress, which never met, and on the fall of the Rattazzi-La Marmora cabinet the king, in spite of the quarrel at Monzambano, asked Cavour to take office again. By January he was once more premier, as well as minister for foreign affairs and of the interior. His first act was to invite the people of Italy to declare their own wishes with regard to annexation to Piedmont; but Napoleon still refused to consent to the union of Tuscany with Piedmont, for he contemplated placing one of his own relatives on the throne of the grand-duchy. Cavour now saw that Napoleon might be ready to deal, and, although the bargain of the preceding year had not been exactly fulfilled, as the Austrians were still in Venice, he again brought forward the question of Nice and Savoy. To Cavour no less than to the king the loss of these two provinces was a cruel wrench, but it was a choice between them and central Italy. The Piedmontese ministers, however, who were not in the least in favour of union with Piedmont, and Napoleon became more pressing, going so far as to threaten that unless the cession were made, the French troops would leave Lombardy at the mercy of Austria and occupy Bologna and Florence. On the 24th of March the treaty was signed and the emperor's opposition to the annexation of central Italy withdrawn. On the 2nd of April the parliament representing Piedmont, the duiches of Parma and Modena, Tuscany and Romagna, met, and Cavour had the difficult and ungrateful task of explaining the cession of Nice and Savoy. In spite of some opposition, the agreement was ratified by a large majority.

The situation in the kingdom of Naples was now becoming critical, but there seemed as yet little chance of union with upper Italy, for the Bourbon government was a more or less regular one, and, although risings had broken out, there was no general revolution. Cavour therefore had to follow a somewhat double-faced policy, on the one hand negotiating with the Bourbon king (Francis II.), suggesting a division of Italy between him and Victor Emmanuel, and, on the other secretly backing up the revolutionary agitation. Having now learnt that Garibaldi was planning an expedition to Sicily with his volunteers, he decided, after some hesitation, not to oppose its departure; on the 5th of May it sailed from Quarto near Genoa, and Cavour was only deterred from declaring war on Naples by the fear of foreign complications. Garibaldi with his immortal Thousand landed at Marsala, and the whole rotten fabric of the Bourbon government collapsed. At Palermo they were welcomed by the Piedmontese admiral Persano, and soon the whole island was occupied and Garibaldi proclaimed dictator. The general now proposed to cross over to the mainland, and this placed Cavour in a serious dilemma; Russia and Austria protested against the expedition, France and Prussia were unfriendly, Great Britain alone remained warmly pro-Italian. He still hoped for a revolution in Naples, so that King Victor's authority might be established before Garibaldi's arrival, but this proved impossible. The Piedmontese army crossed the Strait of Messina into the Neapolitan government fell, and he entered Naples in triumph. But there was still danger that he might be subsequently defeated, for the Neapolitan army was still a force in being, and Cavour feared, moreover, that, although Garibaldi himself had always joyfully acted in the king of Italy's name, the red republicans around him might lead him to commit some imprudence and plunge the country into anarchy. The cession of Nice, Garibaldi's birthplace, had made an impassable gulf between the two men, and neither quite trusted the other. Cavour also feared that Garibaldi might invade the papal states, which would have led to further international complications. In any case, Rome must not be touched for the present, since Napoleon was pledged to protect the pope; but as the latter had made large armaments, and his forces, consisting largely of brigands and foreigners under the French general Lamoricière, were in a menacing attitude on the frontier, Cavour decided on the momentous step of annexing the papal states with the exception of the Roman province. The Italian army crossed the frontier from Romagna on the 11th of September, whereupon every power, except Great Britain and Sweden, withdrew its minister from Turin. But the troops advanced and were everywhere received with open arms by the people; Ancona was taken, Lamoricière was defeated and captured at the battle of Castelfidardo, and on the 20th King Victor marched into the Neapolitan kingdom. On the 1st of October Garibaldi defeated the Neapolitan troops on the Volturro, and Gaeta alone, where King Francis of Naples had retired, still held out.

New difficulties with Garibaldi arose, for he would not resign his dictatorship of the southern provinces, and wished to march on Rome. Cavour had to use all his tact to restrain him and at the same time not to appear ungrateful. He refused to act despotically, but he summoned parliament to vote on the annexation, which it did on the 17th. Two days later Garibaldi magnanimously gave in to the nation's will and handed his conquests over to King Victor as a free gift. Gaeta was invested, but Garibaldi, who had been promised the name of dictator, after a long siege, surrendered, and the city was taken. But there for some reason unknown kept his fleet before the town, preventing any attack by sea until England induced him to withdraw it, the garrison surrendered on the 13th of February, and King Francis retired to Rome. Parliament was dissolved once more; the new chamber showed an overwhelming majority in favour of Cavour, and Victor Emmanuel was proclaimed king of Italy.

The last question with which Cavour had to deal was that of Rome. For some years past the pope had only been able to maintain his authority by the help of foreign troops, and Cavour saw that as long as this state of things lasted there could be no united Italy. In October he declared in parliament that Rome must be the capital of Italy, for no other city was recognized as such by the whole country, and in January 1861 a resolution to that effect was passed. But owing to Napoleon's attitude he had to proceed warily, and made no attempt for the present to
CAVOUR—CAVY

CAVOUR (it. Caburrum or Forum Vibili), a town of Piedmont, Italy, in the province of Turin, 32 m. S.W. by rail and steam tram (via Pinerolo from the town of Turin). Pop. (1901), 2091; commune, 6843. It lies on the north side of a huge isolated mass of granite (the Rocca di Cavour) which rises from the plain. On the summit was the Roman village, which belonged to the province of the Alpes Cottiae. There are some ruins of medieval fortifications. The town gave its name to the Benso family of Chieri, who were raised to the marquisate in 1771, and of which the statesman Cavour was a member.

For the ancient name see Th. Mommensen in Corp. Inscrip. Lat. v. (Berlin, 1877), p. 825.

CAVY, a name commonly applied to several South American rodent animals included in the family Caviidae (see Rodentia), but perhaps properly applicable only to those belonging to the typical genus Cavia, of which the most familiar representative is the domesticated guinea-pig. Caviids in general, the more typical representatives of the Caviidae, are rodents with hoof-like nails, four front and three hind toes, imperfect collar-bones, and the cheek-teeth divided by folds of enamel into transverse plates. The tail is short or rudimentary, the incisors are short, and the outer surface of the lower incisor by a distinct ridge.

True cavi, or coules (Cavia), are best known by the guinea-pig, a domesticated and parti-coloured race derived from one of the wild species, all of which are uniformly coloured. They are comparatively small and stoutly built animals, with short, rounded ears and no tail. In habits they are partly diurnal; and live either in burrows among the crevices of rocks, beneath the leaves of aquatic plants in marshy districts, or underneath the floors of outbuildings. Their cries are faint squeaks and grunts. They feed upon nearly all vegetable substances, but drink little. Generally they associate in small societies, and seldom wander far from home. Although the guinea-pig is a fertile breeder, the wild species only produce one or two young at a birth, and this but once in a year. The young come into the world in a highly developed condition, being able to feed themselves the day following their birth. Caviids are widely distributed in South America, and are represented by several species. Among them may be mentioned the aperea or restless cavy (C. porcellus or C. aperea) of Brazil; the Bolivian C. boliviensis, found in the Andes and isolated by the waters of the R. Paraguay; and the Peruvian C. rapax (C. rapax), characterized by its short blunt claws; and the Peruvian C. cutleri. The latter was tamed by the Incas, and is the ancestor of the guinea-pig. As to the origin of that name, some writers consider it a corruption of Guiana-pig, but it is more probable that the word "Guinea" merely signifies foreign. The guinea-pig is a singularly inoffensive and defenceless creature, of a restless disposition, and wanting in that intelligence which usually characterizes domestic pets, although said to show some discrimination. It is of no particular service to man, neither its flesh nor its fur being generally put to use, while the statement that its presence is sufficient to drive off rats and mice appears to be without foundation. It is exceedingly prolific, beginning to breed at the age of two months; the number of young varying, according to the age of the parent, from four to twelve. It has been calculated that a single pair of guinea-pigs may prove the parent stock of a thousand individuals in a single year.

Every different animal is the Patagonian cavy, or mara (Dolichotis patagonica), the typical representative of a genus characterized by long limbs, comparatively large ears, and a short tail. The animal is about the size of a hare, to which it approximates in form and habits. It is most abundant in the open districts of Patagonia, but also ranges on to the Argentine Pampas, where it is now scarce. Although occasionally seen in large flocks, the mara is more commonly found in small parties or in pairs, the parties commonly moving in single file.

It has a peculiar kind of hopping gait; and is mainly diurnal, in accordance with which habit its eyes are protected by lashes. It lives in a burrow, generally excavated by itself; but when pursued, seeks safety in flight, rather than by a retreat to its hole.

From two to five young are produced twice a year.

Cavour's one absorbing passion was the liberation and reformation of Italy, and to this he devoted his whole life and talent.

BIBLIOGRAPHY.—G. Buozzoni, Bibliografia Cavouriana (Turin, 1898); Countess Evelyn Martinego Cesnacese, Cavour (London, 1898), an excellent and handy little monograph which brings out the chief points of Cavour's life in the right light; G. Massari, Il Conte di Cavour (Turin, 1873); W. de la Rive, Le Comte de Cavour (Paris, 1862), interesting and valuable as the work of a contemporary and intimate friend of Cavour; L. Chiala, Lettere ed inedite del Conte di Cavour (7 vols., Turin, 1883-1887); D. Zanichelli, Gli Scritti del Conte di Cavour (Bologna, 1892), and Cavour (Florence, 1894); E. Arrom, Cavour (Mainz, 1902); F. X. Krauss, Cavour (Mainz, 1902); E. Arrom, L'opera politica del Senatore T. Arrom nel Risorgimento Italiano (Bologna, 1906), a biography of Cavour's devoted private secretary, containing new material.

(L. V. *
much smaller species, *D. salincola*, without the characteristic black band above the tail, inhabits the salt-plain of Argentina. Maras have been introduced into several British parks. Fossil species of *Dolichotis* occur in the caverns of Brazil, and also in the superficial deposits of Argentina. (R. L.)

Cawdor, a village and parish of Nairnshire, Scotland. Pop. of parish (1901) 929. The village is situated 5 m. S.S.W. of Nairn and 3 m. from Gollanfield Junction on the Highland railway. The castle was the scene, according to the tradition which Shakespeare has perpetuated, of the murder of King Duncan by Macbeth, thane of Cawdor (or Calder), in 1040. Since the oldest part of the structure dates from 1454, however, and seemingly had no predecessor, the tradition has no foundation in fact. The building stands on the rocky bank of Cawdor Burn, a right-hand tributary of the Nairn. The massive keep with small turrets is the original portion of the castle, and to it were added, in the 17th century, the modern buildings forming two sides of a square.

Kilravock (pronounced *Kirlauch*) Castle, 1/4 m. W. of Cawdor, occupies a commanding site on the left bank of the Nairn. Its keep dates from 1460, and the later buildings belong to the 17th century. It has continuously been tenanted by the Roses, one of the most remarkable families in Scotland. They came over with William the Conqueror and settled at Kilravock in 1293, since which date son has succeeded father without the intercession of a collateral heir, an instance of direct descent unique in Scottish history. Moreover, nearly every Rose has borne the Christian name of Hugh, and only one attained to a higher social rank than that of laird. Queen Mary was received at the castle in 1562, and Prince Charles Edward was entertained four days before the battle of Culloden. The gardens are remarkable for their beauty.

Cawnpore, or Kanpur, a city and district of British India in the extreme north of the United Provinces. The city is situated on the south bank of the Ganges, 40 m. south-west of Lucknow, and formed from early times a frontier outpost of the people of Oudh and Bengal against their northern neighbours. Clive selected it, on account of its commanding position, as the cantonment for the brigade of troops lent him by the nawab of Oudh. In 1801, when the Ceded Provinces were acquired by the East India Company, it became the chief British frontier station. But by the time of the Mutiny the frontier had left it behind, and it was denuded of troops. Now it is chiefly known as the junction of four railways, the East Indian, Oudh & Rohilkhand, Rajputana and Indian Midland, and as a great emporium for harness, shoes and other leather-work. In 1901 the population was 197,176, showing an increase of 4% in the decade. In 1903 the city was devastated by an epidemic of plague.

The name of Cawnpore is indelibly connected with the blackest episode in the history of the Indian Mutiny—the massacre here in July 1857 of hundreds of women and children by the Nana Sahib. The full details of the siege and massacre will be found under INDIAN MUTINY, and here it will suffice to refer to the local memorials of that evil time. The entrenchment, where General Sir H. M. Wheeler with his small band of soldiers and the European and Eurasian residents were exposed for 21 days to the fire of the mutineers, is merely a bare field, containing the well where many women and children were shot while getting water. This well is now surrounded by an enclosure with an inscription upon its cross. About three-quarters of a mile away, on the banks of the river Ganges, is the Massacre Ghat. A grassy road between banks 10 to 12 ft. high leads down to the river, and it was among the trees on these banks that the murderers concealed themselves who shot down the little garrison as soon as they were embarked in the boats which were to take them to safety. On the river bank is a temple to Siva, of hexagonal shape, old and going to ruin. Steps lead from this temple to an enclosed flight of stairs, which in the cold season descend to the water, but in the rains are covered almost to the top. This is the ghat where some 600 helpless people were slain, in spite of a promise of safe-conduct from the Nana. The remaining 200 victims, who had escaped the bullets of the siege and survived the butchery of the river bank, were massacred afterwards and cast down the famous well of Cawnpore, which is now marked by a memorial and surrounded by gardens. This memorial is crowned by the figure of an angel in white marble, and on the wall of the well itself is the following inscription:

Sacred to the perpetual Memory of a great company of Christian people, chiefly Women and Children, who near this spot were cruelly murdered by the followers of the rebel Nana Bhadur Pant, of Bithur, and cast, the dying with the dead, into the well below, on the 28th day of July, MDCCCLVII.

The district of Cawnpore is situated between the Ganges and Jumna rivers, and is a portion of the well-watered and fertile tract known as the Doab, the total area being 2364 sq. m. The general inclination of the country is from north to south. Besides the two great rivers, the principal streams are the Arand or Rhind, the Kavan or Shigar, the Isan and the Pandu. The district is watered by four branches of the Ganges canal and traversed by two lines of railway. It used to be a great centre of the indigo industry, which has now declined. The population in 1901 was 1,258,868, showing an increase of 4% during the decade.

Caxton, William (c. 1422–1491), the first English printer, was born somewhere in the Weald of Kent, perhaps at Tenterden. The name, which was apparently pronounced Cauxtone, is identical with Causton, the name of a manor in the parish of Hadlow, and was a fairly common surname in the 15th century. The date of Caxton's birth is arbitrarily fixed in 1478 by Oldys as 1412. Blades, however, inferred that in 1438, when he was apprenticed to Robert Large, he would not have been more than sixteen years of age. This would place his birth in 1422–1423. Robert Large was a rich silk merchant who became sheriff in 1430 and lord mayor of London in 1439, and the fact of Caxton's apprenticeship to him argues that Caxton's own parents were of good standing. He was appointed mayor of Bruges in 1447, leaving a small bequest to Caxton, and his executors would be glad to place the young man where he could finish his term. He was probably sent direct to Bruges, then the central foreign market of the Anglo-Flemish trade, for he presently entered business there on his own account. In 1450 his name appears in the Bruges records as standing joint surety for the sum of £100; and in 1463 he was acting governor of the company of Merchant Adventurers in the Low Countries. This association, sometimes known as the "English Nation," was dominated by the Merchants' Company, to the livery of which Caxton had been formally admitted in London in 1453. The first governor, appointed in terms of a charter granted by Edward IV, in 1462, was W. Olavre, but Caxton's position is definitely asserted in 1464. In that year he was appointed, together with Sir Richard Whitehill, to negotiate with Philip, duke of Burgundy, the renewal of a treaty concerning the wool trade, which was about to expire. These attempts failed, and Caxton employed, with two other members of the Merchants' Company, in a similar but successful mission in October 1468 to the new duke, Charles the Bold, who earlier in the year had married Princess Margaret of York, sister of Edward IV. The last mention of Caxton in the capacity of governor of the "English Nation" is on the 13th of August 1469, and it was probably about that time that he entered the household of the duchess Margaret, possibly in the position of commercial advisor. In his diplomatic mission in 1468 he had been associated with Lord Scales, afterwards Earl Rivers and one of his chief patrons, and at the Burgundian court he must have come in touch with Edward IV during his brief exile in 1470.

He had begun his translation of the popular medieval romance of Troy, *The Recuyell of the Histories of Troye*, from the French of Raoul le Fèvre, early in 1469; and, after laying it aside for some time, he resumed it at the wish of the duchess Margaret, to whom the MS. was later died in September 1471. During his thirty-three years' residence in Bruges Caxton would have access to the rich libraries of the duke of Burgundy and other nobles, and about this time he learned the art of printing. His disciple, Wynken de Worde, says that he was taught at Cologne, probably during a visit there in 1471, recorded in the preface to...
the Recuyell; Blades suggests that he learnt from Colard Mansion, but there is no evidence that Mansion set up his press at Bruges before 1474. He ceased to be a member of the Guild of St John (a guild of illuminators) in 1473, and the first dated book he is known to have printed is dated 1476. Mansion and Caxton were partners or associates at Bruges, where Caxton printed his Recuyell in 1474 or 1475. His second book, The Game and Playe of Chesse, from the Liber de luco scacchorum of Jacobus de Cessolis through the French of Jehan de Vignay, was finished in 1474, and printed soon after; the last book printed by Mansion and Caxton at Bruges was the Quatre derrienieres choses, an anonymous treatise usually known as De quattuor nonissimis. Other books in the same type were printed by Mansion at Bruges after Caxton's departure.

By September 1476 Caxton had established himself in the almonry at Westminster in the sign of the Red Pale. Robert Copland the printer, who was afterwards one of Caxton's assistants, states that Caxton began by printing small pamphlets. The first dated book printed in England was Lord Rivers's translation (revised by Caxton) of The Troieuser of the philosophres (1477). From this time until his death in 1491, Caxton was busy writing and printing. His services to English literature, apart from his work as a printer (see TYPOGRAPHY), are very considerable. His most important original work is an eighth book added to the Polychronicon (vol. viii. in the Rolls Series edition) of Ralph Higden. Caxton revised and printed John of Trevisa's work, and brought down the narrative himself from 1338 to 1460, using as his authorities Fasciculus temporum, a popular work in the 15th century, and an unknown Aureus de universo. In the year before his death he complained in the preface to his Enyedos of the changing state of the English language, a condition of things which he did as much as any man to remedy. He printed Chaucer's Canterbury Tales (1478?) and (1483), Troilus and Cressida (1483?), the House of Fame (1483?), and the translation of Boethius (1487?); Gower's Confessio Amantis (1483?), and many poems of Lydgate. His press was, however, not worked for purely literary ends, but was a commercial speculation. For the many service-books which he printed there is no doubt a sure sale, and he met the taste of the upper classes by the tales of chivalry, which circulated regularly from his press. He printed Malory's Morte d'Arthur, and himself translated from the French the Boke of Histories of Jason (1477?), The Historie of Reynart the Foxe (from the Dutch, 1481 and 1489?), Godfrey of Bolyune or The Siege and Conqueste of Jerusalem (1481), The Lyf of Charles the Grete (1485), The Knight Parys and the Fayr Vyenne (1485), Blanchardyn and Eglantine (1485?), The Fore Sonnes of Aymon (1489?), also the Morale Proverbs (1478), and the Fayttes of Armes and of Chynadrye (1489) of Christine de Pisan. The most ambitious production of his press was perhaps his version of the Golden Legend, the translation of which he finished in November 1483. It is based on the lives of the saints as given in the 13th century Legenda aurea of Jacobus de Voragine, but Caxton chiefly used existing French and English versions for his compilation. The book is illustrated by seventy woodcuts, and Caxton says he was only encouraged to persevere in his laborious and expensive task by the liberality of William, earl of Arundel. The idleness which he so often deplores in his prefaces was no vice of his, for in addition to his voluminous translations his output as a printer was over 18,000 pages, and he published ninety-six separate works or editions of works, with apparently little skilled assistance, though later printers, Wynkyn de Worde, Robert Copland and possibly Richard Pynson, were trained under him.

The different fonts of type used by Caxton are illustrated by Blades and Duff, and there is an excellent selection of Caxtons in the British Museum, in the University library at Cambridge, besides those in private hands. A record price for a Caxton was reached in 1902 when Mr Bernard Quaritch paid £225 for The Royal Book (1487?), a translation of the popular Somme des vices et des vertus. His books have no title-pages, and from 1487 onwards are usually adorned with a curious device, consisting of the letters W. C. separated by a trade mark, with an elaborate border above and below. The flourishes on the trade mark have been fancifully interpreted as S.C. for Sancta Colonia, implying that Caxton learnt his art at Cologne, and the whole mark has been read as 74, for 1474, the date of his first printed book. This device was first used in an edition of the Sarum misal, printed for Caxton by George Maynial in Paris, and was subsequently adopted with small alterations by his successor at the Westminster press, Wynkyn de Worde. The first of his books containing woodcut illustrations was his Myrour of the World (1481), translated from Vincent de Beauvais, which has diagrams and pictures for the assistance of young students. He had used a woodcut initial letter in his broadside Indulgence printed in 1480.

No record of Caxton's marriage or of the birth of his children has survived, but, according to Godeffroy Arundel, Caxton's secretary after 1496, when Caxton made claims in connexion with his work in the west.

AUTHORITIES.—Earlier biographies of Caxton were superseded by the work of William Blades, whose Life and Typography of William Caxton (2 vols., 1861-1865) remains the standard authority. It contains a bibliography of each of the works issued from Caxton's press. For later discoveries see George Bullein, History of the Caxton celebration loan collection exhibited at South Kensington in 1877; articles by E. J. Scott in the Athenaeum (Feb. 10, 1900; May 21 and June 8, 1902); articles in Notes and Queries (April 21, 1900; July 24, 1900), and the publications of the Caxton Club, Chicago, notably William Caxton, by E. Gordon Duff (1905). See also Census of Caxtons, by Seymour de Ricci, No. xv. of the illustrated monographs of the Bibliographical Society, 1909. Many of Caxton's works are translations of suitable modern reprints; the Golden Legend, the Recuyell and Goddefroy of Rolynge, were printed by William Morris at the Kelmscott Press in 1892-1893; the Boke of Carteye (1888), the Lyf of Charles the Grete (1880), Alain Chartier's Curial (1888), Poure Sonnes of Aymon (1884), Enyedos (1890), Blanchardyn and Eglantine (1890), and others, by the Early English Text Society. For modern editions of Reynard see REYNARD THE FOX. No authentic portrait of Caxton is known, but a MS. at Magdalen College, Cambridge, of the last six books of the Metamorphoses of Ovid, translated by Caxton, is probably in his handwriting.

CAYENNE, a seaport and the capital of French Guiana, on the N.W. extremity of the island of Cayenne, and near the mouth of the river of that name, in 4° 56' 28" N., and 52° 20' 36" W. Pop. about 12,600. The town forms an almost perfect square, and has clean and well-macadamized streets. The houses, mostly of two storeys, are of wood, strengthened on the first and ground floors by brickwork. In the old town, which contains the government-house and Jesuits' College, the streets are not so regularly and well built as in the new. The Place d'Armes, a fine quadrangular space, lies between them. To the right of the governor's house is Mount Cépéron, on which stand Fort St Michel, the marine barracks, the signal station and the lighthouse. Here, too, are the capacious reservoirs for the water-supply of the town, the source of which is a lake to the south of the island. The harbour is shallow at its entrance, and craft drawing more than 14 ft. are obliged to anchor 6 m. from the town. There is no dock for the repair of vessels; but there are two quays at the town. The principal exports of Cayenne are gold, cocoa, cattle, hides, woods and spices. The imports are French wines, spirits and liqueurs; silk and cotton stuffs, tobacco, hardware, glass, earthenware, cloth, preserved meat, fish, and vegetables, maize, flour, hay, bread, oils and cattle. There is a regular mail service between Cayenne and Martinique once a month. Cayenne is the seat of the government of French Guiana, and was formerly a penal settlement for political offenders. Food as well as clothing is exorbitantly dear, the only cheap articles of consumption being bread and French wines. The temperature of Cayenne is between 76° and 88° Fahr. throughout the year; but the heat is tempered by easterly winds. Between December and March a north wind blows, unfavourable to weak constitutions. Yellow and other fevers often attack the
inhabitants of the town, but the climate, though moist, is as a whole healthy. (See Guiana.)

**CAYENNE PEPPER (Guinea Pepper, Spanish Pepper, Chillies),** a preparation from the dried fruit of various species of *Capsicum,* a genus of the natural order Solanaceae. The true peppers are members of a totally distinct order, Piperaceae. The fruits of plants of the genus *Capsicum* have all a strong, pungent flavour. The capsicums bear a greenish-white flower, with a star-shaped corolla and five anthers standing up in the centre of the flower like a tube, through which projects the slender style. The pod-like fruit consists of an envelope at first fleshy and afterwards leathery, within which are the spongy pulp and several seeds. The plants are herbaceous or shrubby; the leaves are entire, and alternate, or in pairs near one another; the flowers are solitary and do not arise in the leaf-axils. There are about thirty species, natives of Central and South America. They are now grown in various parts of the world, both for the sake of the fruit and for ornament. In England the annual sorts are sown from March to the middle of April under a frame. They can be planted out when 2 or 3 in. high, and in June may be transferred to a light rich soil in the open garden. They flower in July or August, and produce pods from August till the end of September. The perennial and shrubby kinds may be wintered as annuals in England; these plants are used to make cayenne pepper. The annual or common capsicum (*C. annuum*), the Guinea pepper plant, was brought to Europe by the Spaniards, and was grown in England in 1548. It is indigenous to South America, but is now cultivated in India, Hungary, Italy, Spain and Turkey, with the other species of Capsicum. It is a hardy herbaceous plant, which attains a height of 2 or 3 ft. There are numerous cultivated forms, differing in the shape and colour of the pod, which varies from more or less roundish to narrow-ellipsoidal, with a smooth or wrinkled coat, and white, yellow, red or black in colour. The principal source of cayenne pepper is *C. frutescens,* the shrub or goat pepper, a dwarf shrub, a native of South America, but commonly cultivated in the East Indies. It produces a small, narrow, bright red pod, having very pungent properties. *C. teregonum,* or bonnet pepper, is a species much esteemed in Jamaica; it bears very fleshy fruits. Other well-known kinds of capsicum are the cherry pepper (*C. cerasiforme,* with small berries; bell pepper (*C. grossum,* which has thick and pulpy fruit, well adapted for pickling; and berry or bird pepper (*C. baccatum,* a Capsicum plant which has grown as a garden annual since 1581; its fruit is globular, and about the size of a cherry. The West Indian stomachic *man-dram* is prepared by mashing a few pods of bird pepper and mixing them with sliced cucumber and shallots, to which have been added a little lime-juice and Madeira wine. Chillies, the dried ripe or unripe fruit of capsicums, especially *C. annuum* and *C. frutescens,* are used to make chilli-vinegar, as well as for pickles. Cayenne pepper is manufactured from the ripe fruits, which are dried, ground, mixed with wheat flour, and made into cakes with yeast; the cakes are baked till hard like biscuit, and then ground and sifted. The pepper is sometimes prepared by simply drying the pods and pounding them fine in a mortar. Cayenne pepper is occasionally adulterated with red lead, verminol, ochre, salt, ground-rice and turmeric. The taste of the pepper is impaired by exposure to damp and the heat of the sun. Chillies have been in use from time immemorial; they are eaten in great quantity by the people of Guiana and other warm countries, and in Europe they are largely consumed both as a spice and as medicine.

The dried ripe fruit of *Capsicum frutescens* from Zanzibar, known as the pepper tree, contains red volatile pungent volatile matter, official in the British Pharmacopoeia under the name *Capsi Fructus.* The fruit has a characteristic, pungent odour and an intensely bitter taste. The chief constituents are a crystallizable resin, capsaicin, a volatile alcohol, capiscine and a volatile oil. The dose is 1/10 grain. The British Pharmacopoeia contains two preparations of capsicum, a tincture (dose 5-15 minims) and an ointment. Externally the drug has the usual action of a volatile oil, being a very powerful counter-irritant. It does not, however, cause postulation. Its internal action is also that of its class, but its marked contact properties make it specially useful in gastronomy and flatulence, and sometimes in hysteric.

**CAYEY,** an inland district and mountain town of the department of Guayama, Porto Rico, celebrated for its cool, invigorating climate and the beauty of its scenery. Pop. (1890) of the town, 3763; of the district, 14,442. The town is surrounded by mountain summits, the highest of which, El Torito, rises to an elevation of 2,362 ft. above sea-level. It was made a military post by the Spaniards and used as an acclimatizing station. The old Spanish barracks have been enlarged and improved by the American military authorities and, under the name of "Henry Barracks," are used for the same purpose. The town is a popular summer resort for residents of the coast cities. The surrounding country is wooded and very fertile, being especially noted for its coffee and tobacco. The town has large cigar factories. Cayey is connected with Guayama by an excellent military road.

**CAYLEY, ARTHUR (1821-1895),** English mathematician, was born at Richmond, in Surrey, on the 16th of August 1821, the second son of Henry Cayley, a Russian merchant, and Maria Antonia Doughty. His father, Henry Cayley, retired from business in 1829 and settled in Blackheath, where Arthur was sent to a private school kept by the Rev. G. B. F. Potticary; but he was soon called to the King’s College school, London. He soon showed that he was a boy of great capacity, and in particular that he was possessed of remarkable mathematical ability. On the advice of the school authorities he was entered at Trinity College, Cambridge, as a pensioner. He was there coached by William Hopkins of Peterhouse, was admitted a scholar of the college in May 1840, and graduated as senior wrangler in 1842, and obtained the first Smith’s Prize at the next examination. In 1842, also, he was elected a fellow of Trinity, and became a major fellow in 1845, the year in which he proceeded to the M.A. degree. He was assistant tutor of Trinity for three years. In 1846, having decided to adopt the law as a profession, he left Cambridge, entered at Lincoln’s Inn, and became a pupil of the conveyancer Mr Christie. He was called to the bar in 1849, and remained at the bar fourteen years, till 1863, when he was elected to the new Sadlerian chair of pure mathematics in the university of Cambridge. He settled at Cambridge in the same year, and married Susan, daughter of Robert Moline of Green- wich. He continued to reside in Cambridge and to hold the professorship till his death, which occurred on the 20th of July 1895. From his youth he was eminently industrious, and his death was constantly engaged in mathematical investigation. The number of his papers and memoirs, some of them of considerable length, exceeds 800; they were published, at the time they were composed, in various scientific journals in Europe and America, and are now embodied, through the enterprise of the syndics of the Cambridge University Press, in thirteen large quarto volumes. These form an enduring monument to his fame. He wrote upon nearly every subject of pure mathematics, and also upon theoretical dynamics and spherical and physical astronomy. He was quite as much a geometer as he was an analyst. Among his most remarkable works may be mentioned his ten memoirs on quantics, commenced in 1854 and completed in 1878; his creation of the theory of matrices; his researches on the theory of groups; his memoir on abstract geometry, a subject which he created; his introduction into geometry of the "absolute"; his researches on the higher singularities of curves and surfaces; the classification of cubic curves; additions to the theories of rational transformation and correspondence; the theory of the twenty-seven lines that can be drawn from three points of a surface; the surface that gives rise to the attraction of ellipsoids; the British Association Reports, 1857 and 1862, on recent progress in general and special theoretical dynamics, and on the secular acceleration of the moon’s mean motion. He is justly regarded as one of the greatest of mathe-
of science. Amongst others may be noted honorary degrees by the universities of Oxford, Dublin, Edinburgh, Göttingen, Heidelberg, Leiden and Bologna. He was fellow or foreign correspondent member of the French Institute, the academies of Berlin, Göttingen, St Petersburg, Milan, Rome, Leiden, Upsala and Hungary; and he was nominated an officer of the Legion of Honour by President Carnot. At various times he was president of the Cambridge Philosophical Society, of the London Mathematical Society and of the Royal Astronomical Society. He was elected a fellow of the Royal Society in 1852, and received from that body a Royal medal in 1859 and the Copley medal in 1882. He also received the De Morgan medal from the London Mathematical Society, and the Huygens medal from Leiden. His nature was noble and generous, and the universal appreciation of this fact gave him great influence in his university. His portrait, by Lowes Dickinson, was placed in the hall of Trinity College in 1874, and his bust, by Henry Wiles, in the library of the same college in 1888. (F. A. M.)

CAYLUS, ANNE CLAUDE PHILIPPE DE TUBIÈRES DE GRIMGOARD DE PESTELS DE LEVÉS, Comte de, Marquis d'Esternay, St Antoine de Luséga, Bolognese (1717), was the grandson of letters, was born at Paris on 31st of October 1692. He was the eldest son of Lieutenant-General Count de Caylus. His mother, Marthe Marguerite le Vailo de Villette de Murçay, comtesse de Caylus (1673–1729), was a cousin of Mme de Maintenon, who brought her up like her own daughter. She wrote valuable memoirs of the court of Louis XIV. entitled Souvenirs; these were edited by Voltaire (1770), and by many later editors, notably Renouard (1806), Ch. Asselineau (1806), M. de Lescure (1874), M. E. Rauné (1881), J. Soury (1883). While a young man Caylus distinguished himself in the campaigns of the French army, from 1709 to 1714. After the peace of Rastadt he spent some time in travelling in Italy, Greece, the East, England and Germany, and devoted much attention to the study and collection of antiquities. He became an active member of the Academy of Painting and Sculpture and of the Academy of Inscriptions. Among his antiquarian works are Recueil d'antiquités égyptiennes, étrusques, grecques, romaines, et gauloises (6 vols., Paris, 1753–1755), Numismatique des emperors romains, and a Mémoire (1755) on the method of encaustic painting with wax mentioned by Pliny, which he claimed to have rediscovered. Diderot, who was no friend to Caylus, maintained that the proper method had been found by J. B. Bachelier. Caylus was an admirable engraver, and copied many of the paintings of the great masters. He caused engravings to be made, at his own expense, of Bartoli's copies from ancient pictures and published Nouveaux sujets de peinture et de sculpture (1755) and Tableaux tirés de l'histoire, de l'Odyssee, et de l'Énéide (1757). He encouraged artists whose reputations were still in the making, but his patronage was somewhat capricious. Diderot expressed this fact in an epigram in his Salon of 1765: “La mort nous a délivrés du plus cruel des amateurs.” Caylus had quite another side to his character. He had a thorough acquaintance with the gayest and most disreputable circles of Parisian life, and left a number of more or less witty stories dealing with it. These were collected (Amsterdam, 1787) as his Oeuvres de débauche. The best of them is the Histoire de M. Guillaume, cocher (c. 1730).

The Souvenirs du comte de Caylus, published in 1805, is of very diverse kind. There are also two Correspondances du comte de Caylus with the père Fiacchelli (1777); and a notice by O. Uzanne prefixed to a volume of his Felicities (1879).

CAYMAN ISLANDS, a group of three low-lying islands in the West Indies. They consist of Grand Cayman, Little Cayman and Cayman Brac, and are situated between 79° 44' and 80° 26' W. and 19° 44' and 10° 6' N., forming a dependency of Jamaica, which lies 178 m. E.S.E. Grand Cayman, a rock-bound island protected by coral reefs, is 17 m. long and varies from 4 m. to 7 m. in breadth. It has two towns, Georgetown and Boddentown. Little Cayman and Cayman Brac are both about 70 m. E.N.E. of Grand Cayman. Excepting near the rocky coast, the islands are fruitful, mahogany and other valuable timbers with some dye-wood are grown, and large quantities of coco-nuts are produced by the two smaller islands. Phosphate deposits of considerable value are worked, but the principal occupation of the inhabitants is catching turtles for export to Jamaica. The people are excellent shipwrights and do a considerable trade in schooners built of native wood. The islands are governed by a commissioner, and the laws passed by the local legislative assembly are subject to the assent of the governor of Jamaica. The population of the group is about 5000. The islands were discovered by Columbus, who named them Tortugas from the turtles with which the surrounding sea abounds. They were never occupied by the Spaniards and were colonized from Jamaica by the British.

CAZALES, JACQUES ANTOINE MARIE DE (1758–1805), French orator and politician, was born at Grenade in Languedoc, of a family of the lower nobility. Before 1780 he was a cavalry officer, but in that year was returned as deputy to the states general. In the Constituent Assembly he belonged to the section of moderate royalists who sought to set up a constitution on the English model, and his speeches in favour of retaining the right of war among the king's hands and on the organization of the judiciary gained the applause even of his opponents. A detour from his eloquence, which gave him a place among the finest orators of the Assembly, Cazalets is mainly remembered for a duel fought with Barnave. After the insurrection of the 10th of August 1792, which led to the downfall of royalty, Cazalets emigrated. He fought in the army of the émigrés against revolutionary France, lived in Switzerland and in England, and did not return to France until 1803. He died on the 24th of November 1805. His son, Edmond de Cazalets, wrote philosophical and religious studies.

CAZALIS, HENRI (1840–1909), French poet and man of letters, was born at Cormeilles-en-Parisis (Seine-et-Oise) in 1840. He wrote under the pseudonyms of Jean Caselli and Jean Lahor. His works include: Chants populaires de l'Italie (1863); Vita et figures fantastiques, Romances sans musique (1865); Le Livre du nant (1872); Henry Regnault, sa vie et son œuvre (1872); L'Illusion (1875–1893); Melancolie (1878); Contes des caniques (1885); Les Quatroins d'Al-Gazali (1886); William Morris (1887). The author of the Livre du nant has a predilection for gloomy subjects and especially for pictures of death. His oriental habits of thought earned for him the title of the "Hindou du Parnasse contemporain." He died in July 1909.

See a notice by P. Bourget in Anthologie des poètes fr. du XIXe siècle (1887–1888); J. Lemaître, Les Contemporains (1889); E. Faguet in the Revue bleue (October 1893).

CAZEMBE, the hereditary name of an African chief, whose territory was situated south of Lake Mweru and north of Bangweulu, between 9° and 11° S. In the end of the 18th century the authority of the Cazembe was recognized over a very extensive district. The kingdom, known also as the Cazembe, continued to exist, though with gradually diminishing power and extent, until the last quarter of the 19th century, when the Cazembe sank to the rank of a petty chief. The country is now divided between Great Britain and Belgium Congo. The British half, lying east of the Luapula, forms part of Rhodesia, and the chief town in it is called Kazembe. The native state, ruled by a negro race who overcame the aboriginals, had attained a certain degree of civilization. Agriculture was diligently followed, and cotton cloth, earthenware and iron goods manufactured. The country contains rich deposits of copper, and copper ore was one of the principal articles of export. The Cazembe had despotic power and used it in barbarous fashion. He had hundreds of wives, and his chiefs imitated his example according to their means. On his accession every new Cazembe chose a new site for his residence. In 1796 the Cazembe was visited by Manoel Caetano Pereira, a Portuguese merchant; and in 1798 a more important journey to the same coast was undertaken by Dr Francisco José Maria de Lacerda. He died in that country on
the 18th of October that year, but left behind him a valuable journal. In 1802 two native traders or pombéros, Pedro João Baptista and Amaro José, were sent by the Portuguese on a visit to the Cazembé; and in 1831 a more extensive mission was despatched by the Portuguese governor of Sena. It consisted of Major José Monteiro and Antonio Gamitto, with an escort of 20 soldiers and 120 negro slaves as porters; but its reception by the Cazembé was not altogether satisfactory. In 1868 David Livingstone visited the Cazembé, whose capital at that time numbered not more than 1,000 souls. Since 1894, when the country was divided between Britain and the Congo State, it has been thoroughly explored. An important copper mining industry is carried on in the Congo division of the territory.

See The Lands of the Cazembé, published by the Royal Geographical Society in 1873, containing translations of Lacordaire and Baptista’s journals, and a résumé of Gamitto’s O Mouia Cazembé (Lisbon, 1894); also Livingstone’s Last Journals (London, 1897).

Cazin, Jean Charles (1840–1901), French landscape-painter, son of a well-known doctor, J. Cazin (1788–1864), was born at Sers, Pas-de-Calais. After studying in France, he went to England, where he was strongly influenced by the pre-Raphaelite movement. His chief earlier pictures have a religious interest, shown in such examples as ‘The Flight into Egypt’ (1857), or “Hagar and Ishmael” (1880, Luxembourg); and afterwards his combination of luminous landscape with figure-subjects (“Souvenir de fête,” 1851; “Journée faite,” 1858) gave him a wide repute, and made him the leader of a new school of idealistic subject-painting in France. He was made an officer of the Legion of Honour in 1888. His charming and poetical treatment of landscape is the feature in his painting which in later years has given him an increasing value among connoisseurs. His wife, Marie Cazin, who was his pupil and exhibited her first picture at the Salon in 1876, the same year in which Cazin himself made his début there, was also a well-known artist and sculptor.

Cazotte, Jacques (1719–1792), French poet and author, was born at Dijon, on the 17th of October 1710. He was educated by the Jesuits, and at the age of twenty-seven he obtained a public office at Dijon, but it was not till his return to Paris in 1760 with the rank of commissioner-general that he made a public appearance as an author. His first attempts, a mock romance, and a coarse song, gained so much popularity, both in the court and among the people, that he was encouraged to essay something more ambitious. He accordingly produced his romance, Les Prouesses inimitables d’Ollivier, marquis d’Édesse. He also wrote a number of fantastic oriental tales, such as his Mille et une judaïses, Contes à dormir debout (1742). His first success was with a “poem” in twelve cantos, and in prose intermixed with verse, entitled Ollivier (2 vols., 1762), followed in 1771 by another romance, the Lord Impromptu. But the most popular of his works was the Diable amoureux (1777), a fantastic tale in which the hero raises the devil. The value of the story lies in the picturesque setting, and the skill with which its details are carried out. Cazotte possessed extreme facility and is said to have turned off a seventh canto of Voltaire’s Guerre civile de Genève in a single night. About 1775 Cazotte embraced the views of the Illuminists, declaring himself possessed of the power of prophecy. It was upon this fact that La Harpe made his famous jeu d’esprit, in which he represented Cazotte as prophesying the most minute events of the Revolution. On the discovery of some of his letters in August 1792, Cazotte was arrested; and though he escaped for a time through the love and courage of his daughter, he was executed on the 25th of the following month.

The only complete edition is the Œuvres braves et morales, historiques et philosophiques de Jacques Cazotte (4 vols., 1816–1817), though more than one collection appeared during his lifetime. An édition de luxe of the Diable amoureux was edited (1858) by A. J. Porcher, and a selection of Cazotte’s Contes, edited (1880) by Octave Uzanne, is included in the series of Petits Contes du XVIIIe siècle. The best notice of Cazotte is in the Illuminés (1852) of Gérard de Nerval.

Ceanothus, in botany, a genus of the natural order Rhamnaceae, containing about forty species of shrubs or small trees, natives of North America. They are very attractive from their dense panicles of white or blue flowers, and several species are known as garden plants. The leaves of one of these, C. americanus, New Jersey tea, or red-root, are used instead of the true tea; the root, which contains a red colouring matter, has long been employed by the Indians as a febrifuge.

Ceará, a northern maritime state of Brazil, bounded N. by the Atlantic, E. by the Atlantic and the states of Rio Grande do Norte and Paraíba, S. by Pernambuco, and W. by Piauí; and having an area of 40,253 sq. m. It lies partly upon the north-east slope of the great Brazilian plateau, and partly upon the sandy coastal plain. Its surface is a succession of great terraces, facing north and north-east, formed by the denudation of the ancient sandstone plateau which once covered this part of the continent; the terraces are seamed by watercourses, and their valleys are broken by hills and ranges of highlands. The latter are usually described as mountain ranges, but they are, in fact, only the remains of the ancient plateau, capped with horizontal strata of sandstone, and having a remarkably uniform altitude of 2000 to 2400 ft. The flat top of such a range is called a chapada or tabuleiro, and its width in places is 32 to 56 m. The boundary line with Piauí follows one of these ranges, the Serra de Ibiapaba, which unites with another range on the southern boundary of the state, known as the Serra do Arapirí. Another range, or escarpment, crosses the state from east to west, but is broken into two principal divisions, each having several local names. These ranges are not continuous, the breaking down of the ancient plateau having been irregular and uneven. The higher ranges intercept considerable moisture from the prevailing trade winds, and their flanks and valleys are covered with forest, but the plateaus are either thinly wooded or open campus. These upland forests are of a scrubby character and are called catingas.

The sandy, coastal plain, with a width of 12 to 18 m., is nearly bare of vegetation. The rivers of the state are small and, with one or two exceptions, become completely dry in the dry season. The largest is the Jaguaribe, which flows entirely across the state in a north-east direction with an estimated length of 210 to 465 m. The year is divided into a rainy and dry season, the rains beginning in January to March and lasting until June. The dry season, July to December, is sometimes broken by short showers in September and October, but these are of very slight importance. The soil is thin and porous and does not retain moisture, consequently the long, dry season transforms the country into a barren desert, relieved only by vegetation along the river courses and mountain ranges, and by the hardy, widely-distributed cauara palm (Ceroxylon serrifera), which in places forms groves of considerable extent. Sometimes the rains fail altogether, and then a drought (séca) ensues, causing famine and pestilence throughout the entire region. The most destructive droughts recorded are those of 1711, 1723, 1747–1748, 1790, 1825, 1844–1845, and 1877–1878, the last-mentioned destroying nearly all the live-stock in the state, and causing the death through starvation and pestilence of nearly half-a-million people, or over half the population. The climate, which is generally described as healthful, is hot and humid on the coast, tempered by the cool trade winds; but in the more elevated regions it is very hot and dry, although the nights are cool. The sandy zone along the coast is nearly barren, but behind this is a more elevated region with broken surfaces and sandy soil which is amenable to cultivation and produces fruit and most tropical products when conditions are favourable.

The higher plateau is devoted almost exclusively to cattle-raising, once the principal industry of the state, though recurring séccas have been an insuperable obstacle to its profitable development. There is still a considerable export of cattle, hides and skins, but no effort is made to develop the production of the beef on a large scale. Horses are raised to a limited extent; also goats, sheep and swine. The principal agricultural products are cotton, coffee, sugar, mandioca and tropical fruits. The production of cotton has increased largely since the development of cotton manufactures in Brazil. The natural vegetable productions are important, and include maniçoba or Ceará rubber, cauara wax and fibre, caju wine and ipê-cuana.
There are two lines of railway running inland from the coast: the Baturiti line from Fortaleza to Senador Pompeu, 179 m., and the Sobral line from Camocim (a small port) to Ipiú, 134 m. These railways were built by the national government after the drought of 1877-1878 to give work to the starving refugees, and are now operated under leases. Great dams were also begun for irrigation purposes.

The misfortunes and poverty of the people have hindered their material development to a large extent, but another obstacle is to be found in their racial and social composition. Only a very small percentage of the population which numbered 805,687 in 1890, and 849,127 in 1900, is of pure European origin, the great majority being of the coloured races and their mixtures with the whites. The number of landed proprietors, professional men, merchants, &c., is comparatively small (about one-sixth), and a part of these are of mixed blood; the remaining five-sixths own no property, pay no taxes, and derive no benefits from the social and political institutions about them beyond the protection of the proprietors upon whose estates they live, the nominal protection of the state, and an occasional day’s wage. Education has made no impression upon such people, and is confined almost exclusively to the upper classes, from which some of the most prominent Brazilian politics and literature have come. The state of Ceará has formed a bishopric of the Roman Catholic Church since 1853, the bishop having his residence at Fortaleza. The state is represented in the national congress by three senators and ten deputies. Its local government is vested in a president and legislative assembly of one chamber elected for a period of four years. Three vice-presidents are elected at the same time who succeed to the presidency in case of a vacancy according to the number of votes received. The judicial organization consists of the tribunal da Relação at the state capital and subordinate courts in the comarcas and termos. The judges of the higher courts are appointed for life. The capital of the state is Fortaleza, sometimes called Ceará, which is also the principal commercial centre and shipping port. The principal towns are Aracatuba, Baturiti, Acaraú, Crato, Maranguape and Sobral.

The territory of Ceará includes three of the capitaniaes originally granted by the Portuguese crown in 1554. The first attempts to settle the territory failed, and the earliest Portuguese settlement was made near the mouth of the Rio Camocim in 1604. The French were already established on the coast, with their headquarters at Saint Louis, now Maranhão. Ceará was occupied by the Dutch from 1637 to 1654, and became a dependency of Pernambuco in 1680; this relationship lasted until 1799, when the capitania of Ceará was made independent. The capitania became a province in 1822 under Dom Pedro I. A revolution followed in 1824, the president of the province was deposed fifteen days after his arrival, and a republic was proclaimed. Internal dissensions immediately broke out, the new president was assassinated, and after a brief reign of terror the province resumed its allegiance to the empire. Ceará was one of the first provinces of Brazil to abolish slavery.

CEABÍ, a city and municipality, port of entry, and the capital of the province of Cebú, island of Cebú, Philippine Islands, on the E. coast, a little N. of the centre. Pop. (1901) of the city proper, 18,330; of the municipality, 31,079; in the same year, after the census enumeration, the neighbouring municipalities of Mabolo (pop. 1901, 8,454) and El Pardo (pop. 6,661) were added to the municipality of Cebú. The surrounding country, which is level and fertile, is traversed by several good carriage roads. The port, formed by the north-west shore of the island of Mactán, is well protected from violent winds, and in front of it stands a picturesque Spanish fort. The streets are wide and regularly laid out. The government buildings are fairly good, and the church buildings very fine. Cebú is an episcopal see, and the palace of the bishop, although small, is widely known for its interior decorations. The Augustinian church is famous for its so-called miraculous image of Santo Niño. The Recolet monastery and the seminary of San Carlos are worthy of mention. The cathedral was finished toward the end of the eighteenth century. The San José hospital here was founded by one of the religious orders. There was a leper hospital in the outskirts of the city until 1906, when a leper colony was established on the island of Culión. Commercially, Cebú is the second city of the Philippines. Hemp, tobacco, sugar and copra are the most important exports. In addition to the trade with foreign ports, an important domestic commerce is carried on with Manila, Bohol, Negros and northern Mindanao. Salt, pottery and fabrics of silk, sinamay, hemp and cotton are manufactured, and sugar sacks are woven in considerable quantity. The island of Cebú is known for its excellent mangoes and for the rare cornucopia-shaped sponges, called Venus’s flower basket (Euplectella aspergilum), found here. Historically Cebú is famous as the scene of Magellan’s landing in 1521. A cross, said to be the one first erected by him, is still preserved in the cathedral. The great explorer lost his life in the neighbouring island of Mactán; a monument marks the place where he was
killed. The first Spanish settlement in the Philippines was established at Cebú in 1565, and from that year to 1577 it was the capital of the colony. The city is unincorporated. The language is Cebú-Visayan.

CECCO D’ASCOLI (1257–1327), the popular name of FRANCESCO DEGLI STABILI, a famous Italian encyclopaedist and poet—Cecco being the diminutive of Francesco, and Ascoli, in the marshes of Ancona, the place of the philosopher's birth. He devoted himself to the study of mathematics and astrology, and in 1322 was made professor of the latter science at the university of Bologna. It is alleged that he entered the service of Pope John XXII. at Avignon, and that he cultivated the acquaintance of Dante only to quarrel with the great poet afterwards; but of this there is no evidence. It is certain, however, that, having published a commentary on the sphere of John de Sacrobosco, in which he propounded audacious theories concerning the employment and agency of demons, he got into difficulties with the clerical party, and was condemned in 1324 to certain fasts and prayers, and to the payment of a fine of seventy crowns. To elucidate this sentence he betook himself to Florence, where he was attached to the household of Carlo di Calabria. But his free thinking had got him many enemies: he had attacked the Commenda of Dante, and the Commeone d’Amore of Guido Cavalcanti; and his fate was sealed. Dino di Garbo, the physician, was indefatigable in pursuit of him; and the old accusation of impiety being renewed, Cecco was again tried and sentenced, this time to the stake. He was burned at Florence the day after sentence, in the seventieth year of his age.

Cecco d’Ascoli left many works in manuscript, most of which have never been given to the world. The book by which he achieved his renown and which led to his death was the Acerba (from acervus), an encyclopaedic poem, of which in 1546, the date of the last reprint, more than twenty editions had been issued. It is unfinished, and consists of four books in sesta rima. The first book treats of astronomy and meteorology; the second of stellar influences, of physiognomy, and of the vices and virtues; the third of minerals and of the love of animals; while the fourth propounds and solves a number of moral and physical problems. Of a fifth book, on theology, the initial chapter alone was completed. A man of immense erudition and of great and varied abilities, Cecco, whose knowledge was based on experiment and observation (a fact that of itself is enough to distinguish him from the crowd of savants of that age), had outstripped his contemporaries in many things. He knew of metallic aerolites and shooting stars; the mystery of the dew was plain to him; fossil plants were accounted for by him through terrene revolutions which had resulted in the formation of mountains; he is even said to have divined the circulation of the blood. Altogether a remarkable man, he may be described as one of the many Cassandras of the middle ages—one of the many prophets who spoke of coming light, and were listened to but to have their words cast back at them in accusations of impiety and sentences of death.

The last fault of the many editions of the Acerba is that of Venice, dated 1516. The earliest known, which has become excessively rare, is that of Brescia, which has no date, but is ascribed to 1473 or thereabouts.

CECIL, the name of a famous English family. This house, whose two branches hold each a marquessate, has a great statesmanship and administration to establish and enrich. The first Lord Burghley's many inquiries concerning the origin of his family created for it more than one splendid and improbable genealogy, although his grandfather is the first ascertained ancestor. In the latter half of the 15th century a family of yeomen or small gentry with the surname of Seycel, whose descendants were accepted by Lord Burghley as his kinsmen, lived on their lands at Allt yr Ynys in Walterstone, a Herefordshire parish on the Welsh marches. Of the will of Richard ap Philip Seyceld of Allt yr Ynys, made in 1508, one David Richard Seyceld, apparently his younger son, was overseer. This David seems identical with David Cyssell, Scissell or Cecil, a yeoman admitted in 1494 to the freedom of Stamford in Lincolnshire. He may well have been one of those men from the Welsh border who fought at Bosworth, for at the funeral of Henry VII. he appears as a yeoman of the guard and is given a livery of black cloth. At Stamford he prospered, being three times mayor and three times member of parliament for the borough, and he served as sheriff of Northamptonshire in 1532–1533. Remaining in the service of Henry VIII. he was advanced to be yeoman of the chamber and sergeant-at-arms, being rewarded with several profitable leases and offices. His first wife was the daughter of a Stamford alderman, and his second the already twice widowed heir of a Lincolnshire squire. By the first marriage David Cecil left at his death in 1536 a son and heir, Richard Cecil, who enjoyed a place at court as yeoman of the king's wardrobe under Henry VIII. and Edward VI. A gentleman of the privy chamber and sometime sheriff of Rutland, Richard Cecil had his share at the distribution of abbey lands, St Michael's priory in Stamford being among the grants made to him. William Cecil, only son of Richard, was born, by his own account, in 1520, at Bourne in Lincolnshire. He advanced himself first in the service of the protector Somerset, after whose fall, his great abilities being necessary to the council, he was made a secretary of state and sworn of the privy council. In 1571 he was created Lord Burghley, and in 1575, when he was given the Garter, he was backed by the high treasurer and principal minister to Queen Elizabeth. By his first wife, Mary Cheke, sister of the scholar Sir John Cheke, tutor to Edward VI., he was father to Thomas, first earl of Exeter. By a second wife, Mildred Coke, the most learned lady of her time, he had an only surviving son, Robert Cecil, ancestor of the house of Salisbury.

Created earl of Exeter by James I., the second Lord Burghley was more soldier than statesman, and from his death to the present day the elder line of the Cecils has taken small part in public affairs. William Cecil, 2nd earl of Exeter, took as his first wife the Lady Roos, daughter and heir of the 3rd earl of Rutland of the Manners family. The son of this marriage inherited the barony of Roos as heir general, and died as a Roman Catholic at Naples in 1618 leaving no issue. A third son of the 1st earl was Edward Cecil, a somewhat incompetent military commander, created in 1603 Lord Cecil of Putney and Viscount Wimbledon, titles that died with him in 1638, although he was thrice married. In 1601 a marquessate was given to the 9th earl of Exeter, the story of whose marriage with Sarah Hoggins, daughter of a Shropshire husbandman, has been refined by Tennyson into the romance of "The Lord of Burleigh." This elder line is still seated at Burghley, the great mansion built by their ancestor, the first lord.

The younger or Hatfield line was founded by Robert Cecil, the only surviving son of the great Burghley's second marriage. As a secretary of state he followed in his father's steps, and on the death of Elizabeth he may be said to have secured the accession of King James, who created him Lord Cecil of Essendine (1603), Viscount Cranborne (1604), and earl of Salisbury (1605). Forced by the king to exchange his house of Theobalds for Hatfield, he died in 1612, worn out with incessant labour, before he could inhabit the house which he built upon his new Hertfordshire estate. Of Burghley and his son Salisbury, "great ministers of state in the eyes of Christendom," Clarendon writes that "their wisdom and virtues died with them." The 2nd earl of Salisbury, "a man of no words, except in hunting and hawking," was of the same family as his first cousin, his obsequiousness to the court party, but taking no part in the Civil War came at last to sit in the Protector's parliament. After the Restoration, Pepys saw him, old and discredited, at Hatfield, and notes him as "my simple Lord Salisbury." The 7th earl was created marquess of Salisbury in 1789.

Hatfield House, a great Jacobean mansion which has suffered much from restoration and rebuilding, contains in its library the famous series of state papers which passed through the hands of Burghley and his son Salisbury, invaluable sources for the history of their period.

CECILIA, SAINT, in the Catholic Church the patron saint of music and of the blind. Her festival falls on the 22nd of November. It was long supposed that she was a noble lady of Rome.
who, with her husband and other friends whom she had converted, suffered martyrdom, c. 230, under the emperor Alexander Severus. The researches of de Rossi, however, {Rom. sott. ii. 147}, go to confirm the statement of Fortunatus, bishop of Poitiers (d. 600), that she perished in Sicily under Marcus Aurelius between 176 and 180. A church in her honour existed in Rome from about the 4th century, and was rebuilt with much splendour by Pope Paschal I. about the year 820, and again by Cardinal Sfondrati in 1599. It is situated in the Trastevere near the Ripa Grande quay, where in earlier days the Ghetto was located, and gives a "title to a cardinal priest. Cecilia, whose musical fame rests on a passing notice in her legend that she praised God by instrumental as well as vocal music, has inspired many a masterpiece in art, including the Raphael at Bologna, the Rubens in Berlin, the Domenichino in Paris, and in literature, where she is commemorated especially by Chaucer's "Seconde Nonnes Tale," and by Dryden's famous ode, set to music by Handel in 1736, and later by Sir Hubert Parry (1889).

Another St Cecilia, who suffered in Africa in the persecution of Diocletian (303-304), is commemorated on the 11th of February.

See Chevalier, Répertoire des sources historiques (1903), i. 826 f.

CECROPIA, in botany, a genus of trees (natural order Moraceae), native to South America. They are of very rapid growth, affording a light, soft wood used for making floats. C. pelata is the trumpet tree, so-called from the use made of its hollow stems by the Uaupé Indians as a musical instrument. It is a tree reaching about 50 ft. in height with a large spreading head, and deeply lobed leaves 12 in. or more in diameter. The hollows of the stem and branches are inhabited by ants, which, in return for the shelter thus afforded, and food in the form of succulent growths on the base of the leaf-stalks, repel the attacks of leaf-cutting ants which would otherwise strip the tree of its leaves. This is an instance of "myrmecophily," i.e. a living together for mutual benefit of the ants and the plant.

CECROPS (Κέκροψ), traditionally the first king of Attica, and the founder of its political life (Pausanias ix. 33). He was said to have divided the inhabitants into twelve communities, to have instituted the laws of marriage and property, and a new form of worship. The introduction of bloodless sacrifice, the burial of the dead, and the invention of writing were also attributed to him. He is said to have acted as umpire during the dispute of Poseidon and Athena for the possession of Attica. He decided in favour of the goddess, who planted the first olivetree, which was adjudged to be more useful than the olive. Poseidon caused to spring forth from the Acropolis rock with a blow of his trident (Herodotus viii. 55; Apolloides iii. 14).

As one of the autochthones of Attica, Cecrops is represented as human in the upper part of his body, while the lower part is shaped like a dragon (hence he is sometimes called Δησφώς or ἐγένετος, Diod. Sic. i. 28; Ovid, Metam. ii. 555). Miss J. E. Harrison (in Classical Review, January 1895) endeavours to show that Cecrops was the husband of Athena, identical with the snake-like Zeus Soter or Sospilos, and the father of Erechtheus-Erichthonius.

CEDAR (Lat. cedrus, Gr. κέδρος, a name applied to several members of the natural order Coniferae. The word has been derived from the Arabic Kdrd, worth or value, or from Kerd, rich, and has been supposed by some to have taken its origin from the brook Kedron, in Judaea.

Cedrus Libani, the far-famed Cedar of Lebanon, is a tree which, on account of its beauty, stateliness and strength, has always been a favourite with poets and painters, and which, in the figurative language of prophecy, is frequently employed in the Scriptures as a symbol of power, prosperity and longevity. It grows to a vertical height of from 50 to 80 ft. above the main trunk in a horizontal direction, tapering slightly at the top, and covered with a close, hard, durable wood. The trunk of the Cedar of Lebanon is the largest in the world. It grows in the summits of the Lebanon mountains, and is a favourite tree in the parks and gardens of Europe. The wood is used for making floats, and is also a favourite with artists for scrolls and other ornaments. The cedars of Lebanon are not to be confounded with the cedar of Libanus, which is a tree of the same species, but is not so large as the former.

The original cedar of Lebanon was cut down about 1500 B.C. by King Nebuchadnezzar, who used it for the building of the Temple of Jerusalem. The cedars of Lebanon are still found in the mountains of Syria and Persia, and are cultivated in several of the countries of Europe. The cedars of Lebanon are not to be confounded with the cedar of Libanus, which is a tree of the same species, but is not so large as the former.
Vitrivius "cedars" were growing in Crete, Africa and Syria. Pliny says that their wood was everlasting, and therefore images of the gods were made of it; he makes mention also of the oil of cedar, or cedrium, distilled from the wood, and used by the ancients for preserving their books from moths and damp; papyri anointed or rubbed with cedrium were on this account called cedati libri. Drawers of cedar or chips of the wood are now employed to protect furs and woolen stuffs from injury by moths. Cedar-wood, however, is said to be injurious to natural history objects, and to instruments placed in cabinets made of it, as the resinous matter of the wood becomes deposited upon them. Cedrio, or cedar resin, is a substance similar to mastic, that flows from incisions in the tree; and cedar manna is a sweet exudation from its branches.

The genus Cedrus contains two other species closely allied to C. Libani—Cedrus Deodara, the deodar, or "god tree" of the Himalayas, and Cedrus atlantica, of the Atlas range, North Africa. The deodar forms forests on the mountains of Afghanistan, North Beluchistan and the north-west Himalayas, flourishing in all the higher mountains from Nepal up to Kashmir, at an elevation of from 5,000 to 13,000 ft.; on the peaks to the northern side of the Bhot Tang Pass it grows to a height of 60 to 70 ft. before branching. The wood is close-grained, long-fibred, perfumed and highly resinous, and resists the action of water. The foliage is of a paler green, the leaves are slender and longer, and the twigs are thinner than those of C. Libani. The tree is employed for a variety of useful purposes, especially in building. It is now much cultivated in England as an ornamental plant. C. atlantica, the Atlas cedar, has shorter and denser leaves than C. Libani; the leaves are glaucous, sometimes of a silvery whiteness, and the cones smaller than in the other two forms; its wood also is hard, and more rapid in growth than is that of the ordinary cedar. It is found at an altitude above the sea of from 4,000 to 6,000 ft.

The name cedar is applied to a variety of trees, including species of several genera of Conifers, Juniperus, Thuja, Libocedrus and Cupressus. Thuja gigantea of western North America is known in the United States as White (or Yellow) cedar, and the same name is applied to Cupressus Lawsoniana, also known as Oregon cedar, a native of the north-west States, and one of the most valuable juniper trees of North America. The Bermuda cedar (Juniperus bermudiana) or the red or American cedar (J. virginiana) are both much used in joinery and in the manufacture of pencils; though other woods are now superseding them for pencil-making. The Japanese cedar (Cryptomeria japonica) is a kind of cypress, the wood of which is very durable. Another species of cypress (Cupressus thyoides, also known as Chamaecyparis thyoides or sphacroides), found in swamps in the south of Ohio and Massachusetts, is known as the American white cedar. It has small leaves and fibrous bark, the wood is light, soft and easily-worked, and very durable in contact with the soil, and is much used for boat-building and for making fences and coopers' staves. The Spanish cedar is a name applied to Juniperus thurifera, a native of the western Mediterranean region, and also to another species, J. oxycedrus, a common plant in the Mediterranean region, forming a shrub or low tree with spreading branches and short, stiff, prickly leaves. The latter was much used by the Greeks for making images; and its empoyreumatic oil, Huile de Cade, is used medicinally for skin-diseases. A species of cypress, Cupressus Lawsoniana, which has been naturalized in the neighbourhood of Cintra is known as the cedar of Goa. The genus Widgerringia of tropical and South Africa is also locally known as cedar. W. juniperoides is the characteristic tree of the Cedarberg range in Cape Colony, while W. Whytei, recently discovered in Nyasaland and Rhodesia (the Manje cedar) is a fine tree reaching 150 ft. in height, and yielding an ornamental light yellow-brown wood, suitable for building. The order Cedrelacae (which is entirely distinct from the Conifers) includes, along with the mahoganies and other valuable timber-trees, the Jamaic和 the Australian red cedars, Cedrela odorata, and C. Toona respectively. The cedar-wood of Guiana, used for making canoes, is a species of the natural order Burseraceae, Ilca olissima. It is a large tree, reaching 100 ft. in height, the wood is easily worked, fragrant and durable.

Cedar Creek, a small branch of the North Fork of the Shenandoah river, Virginia, U.S.A. It is known in American history as the scene of a memorable battle, which took place on the 19th of October 1864, between the Union army under Maj.-General P. H. Sheridan and the Confederates under Lieut.-General J. A. Early. (See Shenandoah Valley Campaigns.)

CEDAR FALLS, a city of Black hawk county, Iowa, U.S.A., on the Cedar river, about 100 m. W. of Dubuque. Pop. (1890) 3459; (1900) 5319; (1905, state census) 5320 (872 being foreign-born); (1910) 5012. It is served by the Chicago, Rock Island & Pacific, the Illinois Central, the Chicago Great Western, and the Waterood, Cedar Falls & Northern railways. Its manufactures include flour, grist, and other grain products; hardware, specialties, canned vegetables (especially Indian corn), banking-mill products. It is the seat of the state normal school (1876), and has a public library. The settlement of the place, the oldest in the county, was begun in 1847; it was laid out as a town in 1851, incorporated as a village in 1857, chartered as a city in 1865, and for a short time in 1853 was the county-seat.

CEDAR RAPIDS, a city of Linn county, Iowa, U.S.A., on the Cedar river, in the east central part of the state. Pop. (1890) 18,020; (1900) 25,656, of whom 4478 were foreign-born, an unusually large and influential part being Bohemians; (1910 census) 32,811. It is served by the Chicago, Milwaukee & Saint Paul, the Chicago & North-Western, the Chicago, Rock Island & Pacific (which has repair shops here), and the Illinois Central railways, and by interurban electric lines. The city has an air of substantial prosperity; its principal streets are from 80 ft. to 120 ft. wide, paved with brick and asphalt, and well shaded. Prominent among its buildings are the federal building, the Acacia Masonic temple and the Masonic library. It also contains one of the best collections of Masonic literature in the world. The city has two well-equipped hospitals, a home for aged women, a home for the friendless, and four parks. The grounds of the Cedar Rapids country club comprise 180 acres. Cedar Rapids is in a rich agricultural country. The name of the city was suggested from the rapids in the river, which afford abundant water power and have enabled the city to take first rank in Iowa (1905) as a manufacturing centre. From 1900 to 1905 there was an increase in the value of its manufactured products from $11,135,435 to $16,270,706, or 46-2%. More than one-fourth of the value of its manufactures is in Quaker Oats and other food preparations; among those of less importance are lumber and planing-mill products, foundry and machine-shop products, furniture, patent medicines, pumps, carriages and wagons, packed meats and agricultural implements. Cedar Rapids has also a large grain trade and a large jobbing business, especially in dry goods, millinery, groceries, paper and drugs. At Cedar Rapids (once the home of the Chicago and Piqua Presbyterians), which grew out of the Cedar Rapids Collegiate Institute (1853), was named in honour of Daniel Coe, a benefactor, and was chartered under its present name and opened in 1881; the Interstate Correspondence schools, and the Cedar Rapids business college. The first settlers came in 1838; but the city's early growth was slow, and it was not incorporated until 1856. It has been governed by commission since 1908.

CEFAULU (anc. Cephaloedium), a seaport and episcopal see of the province of Palermo, Sicily, 42 m. E. of Palermo by rail. Pop. (1901) 13,273. The ancient town (of Sicel origin, probably, despite its Greek name) takes its name from the headland (kefalh, head) upon which it stood (1233 ft.); its fortifications extended to the shore, on the side where the modern town now is, in the form of two long walls protecting the port. There are remains of a wall of massive rectangular blocks of stone at the
modern Porta Garibaldi on the south. It does not appear in history before 306 B.C., and seems to have owed its importance mainly to its naturally strong position. The only ancient remains on the mountain are those of a small building in good polygonal work (a style of construction very rare in Sicily), consisting of a passage on each side of which a chamber opens. The doorways are of finely-cut stone, and of Greek type, and the date, though uncertain, cannot, from the careful jointing of the blocks, be very early. On the summit of the promontory are extensive remains of a Saracen castle. The new town was founded at the foot of the mountain, by the shore, by Roger II. in 1131, and the cathedral was begun in the same year. The exterior is well preserved, and is largely decorated with interlacing pointed arches; the windows also are pointed. On each side of the façade is a massive tower of four storeys. The round-headed Norman portal is worthy of note. The interior was restored in 1559, though the pointed arches of the nave, borne by ancient granite columns, are still visible: and the only mosaics preserved are those of the apse and the last bay of the choir: they are remarkably fine specimens of the art of the period (1148) and, though restored in 1859-1862, have suffered much less than those at Palermo and Monreale from the process. The figure of the Saviour is especially fine. The groined vaulting of the roof is visible in the choir and the right transept, while the rest of the church has a wooden roof. Fine cloisters, coeval with the cathedral, adjoin it. (See G. Hubbard in Journal of the R.I.B.A. xv. 333 sq., 1908.) The harbour is comparatively small. (T. A.)

The town of south-eastern Spain, in the province of Murcia, on the right bank of the river Caravaca, a small tributary of the Segura. Pop. (1900) 16,501. Cehegin has a thriving trade in farm produce, especially wine, olive oil and hemp; and various kinds of marble are obtained from quarries near the town. Some of the older houses, however, as well as the parish church and the convent of San Francisco, which still has well-defined Roman inscriptions on its walls, are built of stone from the ruins of Begastri, a Roman colony which stood on a small adjacent hill known as the Cabeceo de Roenas. The name Cehegin is sometimes connected by Spanish antiquaries with that of the Zenaga, Senhajo or Senahe, a North African tribe, which invaded Spain in the 11th century.

CEILING (from a verb "to cell," i.e. to line or cover; of disputed etymology, but apparently connected with Fr. céle, Lat. caelest, skye), in architecture, the upper covering of a church, hall or room. Ceilings are now usually formed of plaster, but in former times they were commonly either boarded (of which St Albans cathedral is perhaps the earliest example), or showed the natural stone, or brick, of which they were moulded and carved, and in France and Italy were richly painted and gilded. Sometimes the ceilings were horizontal, sometimes cantoned on two sides, and sometimes they take the form of a barrel-vault. Ribs are sometimes planted on the boarding to divide up the surface, and their intersections are enriched with bosses. About the middle of the 16th century the ceilings were formed in plaster with projecting ribs, interlaced ornament and pendant, and the characteristics of the Elizabethan style. At Bramall Hall, Broughton Castle, Hatfield, Knowle, Sizergh and Levens in Westmorland, and Dorfold in Cheshire, are numerous examples, some with pendants. In Italy, at the same period, the plaster ceilings were based on the forms taken by vaulting: they were of infinite variety and were richly decorated with sunk panels containing the Roman conventional foliage. Raphael, about 1520, reproduced in the Vatican some of the stucco-duro ornament which he had studied in the Golden House of Nero, excavated under his directions. Later, about the middle of the 16th century, great coves were formed round the room, which were decorated with cartouches and figures in relief, garlands and swags. The great halls of the Ducal Palace at Venice and the galleries of the Pitti Palace at Florence were ceiled in this way. These coved ceilings were introduced into England in the middle of the 17th century. In Holyrood Palace at Edinburgh there is a fine ceiling of 1671, with figures (probably executed by Italian craftsmen) and floral wreaths.

At Coleshill, Berkshire, a ceiling by Inigo Jones (1650) shows a type which became more or less universal for a century, viz. deeply sunk panels with modillions round, and bands enriched with foliage, fruit, &c., in bold relief. Wren, Nicholas Hawksmoor, James Gibbs, John Webb and other architects continued on the same lines, and in 1760 Robert Adam introduced his type of ceiling, sometimes horizontal, and sometimes segmental, in which panels are suggested only, with slight projecting lines and rings of leaves, swags and arabesque work, which, like Raphael's, was based on the ceilings of the Roman tombs and baths at Rome and Pompei. George Richardson followed with similar work, and Sir W. Chambers, in the rooms originally occupied by the Royal Academy and the learned societies in Somerset House, designed many admirable ceilings. The moulds of all the ornamental devices of Robert Adam are preserved and are still utilized for many modern ceilings.

CEILLIER, Remy (1688-1761), Benedictine monk of the Lorraine congregation of St Vannes. He was the compiler of an immense Patrology, Histoire générale des auteurs sacrés et ecclésiastiques (23 vols., Paris, 1729-1763), being a history and analysis of the writings of all the ecclesiastical writers of the first thirteen centuries. He put infinite trouble and time into the work, and many portions of it are exceedingly well done. A later and improved edition was produced in Paris, 1858, in 14 vols. Ceillier's other work, Apologie de la morale des pères de l'Église (Paris, 1718), also won some celebrity.

CELANAE, an ancient city of Phrygia, situated on the great trade route to the East. Its acropolis long held out against Alexander in 333 and surrendered to him at last by arrangement. His successor, Eumenes, made it his headquarters, as did Antigonus until 301. From Lydi-machus it passed to Seleucus, whose son Antiochus, seeing its geographical importance, refounded it on a more open site as Apamea (q.v.). West of the acropolis were the palace of Xerxes and the Agora, in or near which is the cavern whence the Marsyas, one of the sources of the Maeander, issues. According to Xenophon, Cyrus had a palace and large park full of wild animals at Celaenae.

See G. Weber, Dineir-Celanès (1892).

CELANDINE, Chelidonium majus, a member of the poppy family, an erect branched herb from 1 to 2 ft. high with a yellow juice, much divided leaves, and yellow flowers nearly 1 in across, succeeded by a narrow thin pod opening by a pair of thin valves, separating upwards. The plant grows in waste places and hedgerows, and is probably an escape from cultivation. The lesser celandine is a species of Ranunculus (R. Ficaria), a small low-growing herb with smooth heart-shaped leaves and bright yellow flowers about an inch across, borne each on a stout stalk springing from a leaf-axil. It flowers in early spring, in pastures and waste-places.

CELANO, a town of the Abruzzi, Italy, in the province of Aquila, 73 m. E. of Rome by rail. Pop. (1900) 9725. It is finely situated on a hill above the Lago Fucino, and is dominated by a square castle, with round towers at the angles, erected in its present form in 1450. It contains three churches with 13th century façades in the style of those of Aquila. The origin of the town goes back to Lombard times. A count of Celano was first mentioned in 1178. It was the birthplace of Thomas of Celano, the author of the Dies Irae.

CELEBES, one of the four Great Sunda Islands in the Dutch East Indies. Its eastern outline is extremely irregular, and has been compared to that of a starfish with the ray from one side, corresponding to the west side of the island. It consists of four great peninsulas, extending from a comparatively small nucleus towards the north-east, east, south-east and south, and separated by the three large gulfs of Tominini or Gorontalo, Tolo or Tomaiki, and Boni. Of these gulfs the first is by far the largest, the other two having much wider entrances and not extending so far inwards. Most important among the smaller inlets are the bays of Amurang, Kwandang and Tontoli on the

1 The second syllable is accented.
CELEBES

597

north coast, Palos and Pare-Pare on the west, and Kendari or Vosmaer on the east. Of the numerous considerable islands which lie north-east, east and south of Celebes (those off the west coast are few and small), the chief are prolongations of the four great peninsulas—the Sangir and Talaut islands off the north-east, the Banggai and Sula off the east, Wuna and Butox off the south-east, and Salyer off the south. Including the adjacent islands, the area of Celebes is estimated at 77,855 sq. m., and the population at 2,000,000; without them the area is 60,255 sq. m. and the population 1,250,000.

The scenery in Celebes is most varied and picturesque. "Nowhere in the archipelago," wrote A. R. Wallace, "have I seen such gorges, chasms and precipices as abound in the district of Maros" (in the southern peninsula); "in many parts there are vertical or even overhanging precipices five or six hundred feet high, yet completely clothed with a tapestry of vegetation."

Much of the country, especially round the Gulf of Tolo, is covered with primeval forests and thickets, traversed by scarcely perceptible paths, or broken with a few clearings and villages. A considerable part of the island has been little explored, but the general character seems to be mountainous. Well-defined ranges prolong themselves through each of the peninsulas, rising in many places to a considerable elevation. Naturally these ranges are intersected by a number of smaller, irregularly shaped, but energetic, gorges, one of the features of the island is the frequent occurrence, not only along the coasts, but at various heights inland, of beautiful stretches of level ground often covered with the richest pastures. Minahassa, the north-eastern extremity, consists of a plateau divided into sections by volcanoes (Klabat, 6620 ft., being the highest). Sulphur springs occur here. In the west of the northern peninsula the interior consists in part of plateaus of considerable extent enclosed by the coast ranges. Near Lake Posso, in the centre of the island, the mountains are higher; the Tampiko massif has a height of nearly 5000 ft., the chains south and west of the lake have a general altitude of about 4530 ft., with peaks still loftier. In the southern peninsula two chains stretch parallel with the west and east coasts; the former is the higher, with a general altitude of 3200 ft. In the south it joins the Peak of Bontain, or Lompo-battang, a great volcanic mass 10,088 ft. high. In the east central part of the island the mountain Koruve exceeds 10,000 ft., and is supposed to be the highest in the island. An alluvial coast plain, 70 m. wide, stretches along the foot of the western chain, and between the two chains is the basin of Waingane, draining into Lake Tempe. Little is known of the topography of the eastern peninsula. At the base of the south-eastern there is another large lake, Tovieti. In this peninsula there are parallel ranges on the east and west flanks. The trench between them is partly occupied by the vast swamp of Lake Opa.

The rivers of the narrow mountainous peninsulas form many rapids and cataracts; as the Tondano, draining the lake of the same name to the north-west coast of Minahassa at Menado; the Rano-i-Apo, flowing over the plateau of Mongondo to the Gulf of Amurang; the Pogiar, issuing from a little-known lake of that plateau; the Lombagin, traversing narrow canions; and the river of Boni, which has its outfall in the plain of Gorontalo, near the mouth of the Bolango or Tappa, the latter connected by a canal with the Lake of Limbotto. All these rivers are navigable by praus or rafts for only a few miles above the mouth. In central Celebes, the Kodina flows into Lake Posso, and the Kalana discharges into the Gulf of Boni; the Posso, navigable by boats (canoes formed of hollowed tree-trunks), is the only river flowing from the lake to the Gulf of Tomini. The rivers of the southern peninsula, owing to the reliefs of the surface, are navigable to a somewhat greater extent. The Waingane flows into Lake Tempe, and, continued by the Jenerana (Tenrana), which discharges into the Golf of Boni, is navigable for small boats; the Sadang, with many affluents, flows to the west coast, and is navigable by sampans. The Jenemaja is a broad river, navigable far from the mouth. The coasts of Celebes are often fertile and well populated; but, as shown by the marine charts, many sand, mud and stone banks lie near the shore, and consequently there are few accessible or natural ports or good roadsteads.

Geology.—The geological observations on Celebes are too scattered to reveal its structure. The greater part of the island seems to be formed of gneiss and other crystalline rocks. These are overlaid by conglomerates, limestones and clay slates of very doubtful age, the most interesting being a radioradiolarian clay which occurs on the south side of the Malimang Mountains, at the north end of Lake Posso, &c.; it may correspond with the radioradiolarian chert of Borneo. Tertiary beds are found, especially near the coast. The Eocene includes a series of sandstones and marls with lignite, and these are overlaid by nummulitic limestones. The Miocene contains an Orthotome limestone. Intrusive and volcanic rocks of great variety and of various ages occur. Peridotite and gabro form much of the eastern peninsula (Banggai). Leucite and nepheline rocks have been found in various parts of the island, especially in the south-west. In Minahassa, at the northern extremity, there is a large area of tuffs and agglomerates consisting chiefly of augite andesite, and in this area there are many recent volcanic cones. Eruptions still take place at intervals, but the volcanoes for the most part seem to have reached the solfataric stage.

Climate.—The climate of the island, everywhere accessible to the influence of the sea, is maritime-tropical, the temperature ranging generally between 70° and 80° F., the extremes being about 90° and 70° F., only on the higher mountains falling during the night to 50° or 53° F. The rainfall in the northern peninsula is greater than on the southern, but some of the former has rains (not caused by the monsoon), and of smaller amount, 102 in. annually; the latter has a greater rainfall, 137 in., brought by the north-western monsoon, and of which the west coast receives a much larger share than the east.

Fauna and Flora.—In spite of its situation in the centre of the archipelago, Celebes possesses a fauna of a very distinctive kind. The number of species is small, but in many cases they are peculiar to the island. Of land birds, for example, about 160 species are known, and of these not less than about 90 are peculiar, the majority of the remainder being Asiatic in distinction from Australian. Mammals are few in species, but remarkable, especially Macacus niger, an ape found nowhere else but in Bachian; Anoa depressicornis, a small ox-like quadruped which inhabits the mountainous districts; and the babiru or piq-deer of the Malays. Some of the animals are probably descendants of specimens introduced by man; others are allied in species, but not identical, with mammals of Java and Borneo; others again, including the three just mentioned, are wholly or practically confined to Celebes. There are no large beasts, such as the elephant, the rhinoceros or the tapir is represented. Wild-buffaloes, swine and goats are perhaps common; and most of the usual domestic animals are kept. The horses are in high repute in the archipelago; formerly about 700 were yearly exported to Java, but the supply has considerably diminished.

The same peculiarity of species holds in regard to the insects of the Celebes (so far as they are known) as to the mammals and birds. Out of 118 species of butterflies, belonging to four important classes, no fewer than 86 are peculiar; while among the rose-chafers or Cotininae the same is the case in 19 out of 30. Equally remarkable with this presence of peculiar species is the absence of many kinds that are common in the rest of the archipelago; and these facts have been considered to indicate connexion with a larger land-mass at a very distant geological epoch, and the subsequent continuous isolation of Celebes. This view, however, has been controverted. It is held that in the Miocene and Pliocene periods there were land connexions with the Philippines, Java and the Moluccas, and through the last with Australasian lands to the east and south-east. Migration of species has probably taken place mainly in this manner. Those immigrants which remained in what is now Celebes may have developed new species. Moreover, while Celebes has species which are peculiar to itself and one other of the islands just mentioned, it has none which it shares exclusively with Borneo, and thus the importance of the Macassar Strait as a biological division is indicated.

Vegetation is extremely rich; but there are fewer large trees than in the other islands of the archipelago. Of plants that
CELEBES

furnish food for man the most important are rice, maize and mielit, coffee, the coco-nut tree, sago-palm, the orb or native potato, the bread-fruit and the tamarind; with lemons, oranges, mangosteens, wild-plums, Spanish pepper, beans, melons and sugar-cane. The shaddock is to be found only in the lower plains. Indigo, cotton and tobacco are grown; the bamboo and the ratan-palm are common in the woods; and among the larger trees are sandalwood, ebony, sapan and teak. The palm, Arenga saccharifera, furnishes gemutli fibres for ropes; its juice is manufactured into sugar and a beverage called sagoju; and intoxicating drinks are prepared from several other palms.

Products. As in natural vegetation and fauna, so in cultivated products, Celebes, apart from its peculiarities, presents the traditional link between the Asiatic and the Australian regions of the Malay province. For example, rice is produced here in smaller quantity and of inferior quality to that in the western part of the archipelago, but superior to that in the eastern section, where sago and sorghum form the staple articles of food. The products of the forests supply about half the total exports. The fisheries include trengg, turtle and pearl oysters. Gold is worked under European direction in the district of Gorontalo, but with only partial success; the search for coal in the southern peninsula has yielded no satisfactory results; tin, iron and copper, found in the eastern peninsula and elsewhere, are utilized only for native industries.

Natives. The native population of the island is all of Malay stock. The three most important peoples are the Bugis (q.v.) the Macassars and the Mandars. The medley of other Malay tribes, of a more or less savage type, living in the island, are known under the collective name of Alfluros (q.v.). The Macassars are well-built and muscular, and have in general a dark-brown complexion, a broad and expressive face, black and sparkling eyes, a high forehead, a flattish nose, a large mouth and long blackish soft hair. The women are sprightly, clever and amiable. The men are brave and not treacherous, but ambitious, jealous and extremely revengeful. Drunkenness is rare, but they are passionate, and running amuck is frequent among them. In all sorts of bodily exercises, as swimming, wrestling, dancing, riding and hunting, they take great pleasure. Though they call themselves Mahomedans, their religion is largely mingled with pagan superstitions; they worship animals, and a certain divinity called Karena Lov, who has power over their fortune and health. Except where Dutch influence has made itself felt, little attention has been paid by the native races to agriculture; and their manufacturing industries are few and limited. The weaving of cotton cloth is principally carried on by women; and the process, at least for the finer description, is tedious in the extreme. The houses are built of wood and bamboo; and as the use of diagonal struts is not practised, the walls soon lean over from the force of the winds. The Macassar language, which belongs to the Malayo-Javanese group, is spoken in many parts of the southern peninsula; but it has a much smaller area than the Buginese, which is the language of Boni. It is deficient in generalizations; thus, for example, it has words for the idea of carrying in the hand, carrying on the head, carrying on the shoulder, and so on, but has no word for carrying simply. It has adopted a certain number of vocabularies from Sanskrit, Malay, Javanese and Portuguese, but on the whole is remarkably pure, and has undergone comparatively few recent changes. It is written in a peculiar character, which has displaced, and probably been corrupted from, an old form employed as late as the 17th century. Neither bears any trace of derivation from the Sanskrit alphabet. The priests affect the use of the Arabic letters. The literature is poor, and consists largely of romantic stories from the Malay, and religious treatises from the Arabic. Of the few original pieces the most important are the early histories of Gog, Tello and some other states of Celebes, and the Rapan, or collection of the decrees and maxims of the old princes and sages. The modern productions are letters, laws and poems, many of the latter of considerable length.

Divisions, Towns, Population. Celebes is divided by the Dutch, for administrative purposes, into the government of Celebes with dependencies (south-eastern and southern peninsulas and all west coast), and the residencies of Menado (north-eastern peninsula and coast of Gulf of Tomini). The eastern peninsula and coast of the Gulf of Tolo belong politically to the residency of Ternate (q.v.). The following table shows approximately the distribution and composition of the population:

The Government of Celebes and Dependencies is subdivided into the government territory, the vassal states (Boni, q.v., and Ternate), and the federal countries. The density of population for the whole government is estimated as 3-7 or 4 per sq. m., varying from 2-2 in the vassal states and federal countries to 7-9 in the first class of islands, and the districts directly governed by the Dutch. The density of population in districts outside the influence of European government sinks to 1 and less per sq. m. As in the case of Minahassa, the difference between the first and second class of islands is at least sustained to the present day, and many of the third class of natives live by agriculture, and one-third by trade, navigation, shipbuilding and other industries. In agreement with these principal occupations, the centres of population are found in south Celebes, on the coast (not in the interior plains or on the lake, as in Menado). Palos (3000), with good port; Pare-Pare, connected by road with Lake Tempe; and Macassar (17,925), the seat of the governor and the centre of trade for the eastern part of the archipelago. On the south coast must also be named Bonehain (4000); on the east coast, Balong-Ngap; and Buton and Saleyer, seats of administration and ports of call on the island groups of the same names.

The Residency of Menado comprises three districts: Minahassa, the whole states along the north coast west of Minahassa, and Gorontalo, including the other states of the northern peninsula lying along the Gulf of Tomini. The density of population being calculated at about 2-7 to 3 per sq. m. for Celebes, is 16-2 for Minahassa, but only 1-5 to 2 for the Residency of Menado. Centres of population in Menado are Amurang (3000), the seat of a Dutch controller, and a calling place for the steamers of the Indian Packet Company; Menado (10,000), the chief town of the residency, the principal station of the Dutch missionaries; with a fair amount of trade; and an unsafe roadstead; Tondano (12,000), near the lake and river of the same name, at an altitude of nearly 2000 ft., and one of the chief centres; Gorontalo, one of the most important towns of Celebes, carrying on direct trade with Singapore and Batavia; and other coast places have some importance as chief villages of the little states and as ports of call for the vessels of the steam packet company, but have only from 500 to 1000 inhabitants.

History. Celebes was first discovered by the Portuguese in the early part of the 16th century, the exact date assigned by some authorities being 1512. The name is not used by the natives, and is apparently of foreign origin, but has been variously derived, e.g. from the mountain of Klabat or Kalabat, or from Selor, an iron wire carried by the natives, or from those who were first asked for the name of the island were conceived, according to this theory, to have misunderstood their questioners. At the time of the Portuguese discovery, the Macassars were the most powerful people in the island, having successfully defended themselves against the king of the Moluccas and the sultan of Ternate. In 1609 the British attempted to gain a footing. At what time the Dutch first arrived is not certainly known, but it was probably in the end of the 16th or beginning of the 17th century, since in 1607 they formed a connexion with Macassar. In 1611 the Dutch East Indian Company obtained the monopoly of trade on the island of Buton; and in 1618 an insurrection in Macassar gave them an opportunity of obtaining a definite establishment there. In 1660 the kingdom was subjugated, but in 1666 the war broke out anew. It was brought to an end in the following year, and the treaty of Bonga or Banga was signed, by which the Dutch were recognized as protectors.
CELEY—CELESTEINO

599

In 1683 the north-eastern part of the island was conquered by Robert Paddenburgh and placed under the command of the governor of the Moluccas. In 1753 a fort was erected at Menado. The kingdom of Buna was successfully attacked in 1684, and in August of that year the Bonga treaty was renewed in a greatly modified form. Since then the principal military event is the Buna insurrection which was quelled in 1859, but this was far from pacifying the country permanently. A series of revolts of various chiefs in 1905-6 was not arrested without considerable fighting, but after this the whole island was brought under Dutch authority, even where native rule survived.

BIBLIOGRAPHY.—In P. J. Veth's Woordenboek van Nederlandsch Indie there will be found an extensive bibliography of Celebes drawn up by F. van der Heide, and others, for the island and its population, see C. M. Kan, "Celebes," in the Encyclopaedie van Nederlandsch Indie, ed. by P. A. van der Lihl and A. H. Span (The Hague, 1893), &c., vol. i. p. 314. See also F. and P. CELEY (Aipzig graveolens), a biennial plant belonging to the natural order Umbelliferae, which, in its wild state, occurs in England by the sides of ditches and in marshy places, especially near the sea, producing a long stalk and compound leaves with wedge-shaped leaflets, the whole plant having a coarse, rank and peculiar smell. It is also widely distributed in the north temperate region of the Old World. By cultivation and blanching the stalks lose their acid qualities and assume the mild sweetish aromatic taste peculiar to celery as a salad plant. The plants are raised from seed, sown either in a hot bed or in the open garden, according to the season of the year, and after being transplanted into the field, they are, on attaining a height of 6 to 8 in., planted out in deep ditches for convenience of blanching, which is effected by earthing up and so excluding the stems from the influence of light. A large number of varieties are cultivated by gardeners, which are ranged under two classes, white and red,—the white varieties being generally the best flavoured and most crisp and tender. As a salad plant, celery, especially if at all "stringy," is difficult of digestion. Both blanched and green it is stewed and used in soups, the seeds also being used as a flavouring ingredient. In the south of Europe celery is seldom blanched, but is much used in its natural condition.

Celeriac, or turnip-rooted celery (Aipzig graveolens var. rapaceum), is a variety cultivated more on account of its roots than for the stalks, although both are edible and are used for salads and in soups. It is chiefly grown in the north of Europe. As the tops are not required, trenching is unnecessary, otherwise the cultivation is the same as for celery.

CELESTE, MADAME (1815-1858), French dancer and actress, was born on 20th November 1815 at Paris. As a little girl she was a pupil at the ballet class at the Opéra. When fifteen she had an offer from the United States, and made her début at the Bowery theatre, New York. Returning to England, she appeared at Liverpool as Fenella in Massaniello, and also in London (1831). In 1834 she aroused such enthusiasm in America that her admirers carried her on their shoulders and took the horses out of her carriage in order to pull it themselves. It is even said that President Jackson introduced her to his cabinet as an adopted citizen of the United States. Having made a large fortune, she returned to England in 1837. She now gave up dancing, and appeared as an actress, first at Drury Lane and then at the Haymarket. In 1844 she joined Benjamin Webster in the management of the Adelphi, and afterwards took the sole management of the Lyceum till 1861. She made a third visit to the United States from 1865 to 1868, and retired in 1870. Her favourite part was in business houses, Green Bushes. She died in Paris on the 21st of February 1882.

CELESTINA, LA, the popular alternative title attached from 1539 (or earlier) to the anonymous Comedia de Calisto y Melibea, a Spanish novel in dialogue which was celebrated throughout Europe during the 16th century. In the two earliest known editions (Burgos, 1499, and Seville, 1501) the Comedia consists of sixteen acts; the reprints issued after 1501 are entitled Tragicomedia de Calisto y Melibea, and contain twenty-one acts. Three of these reprints include a twenty-second act which is admittedly spurious, and the authenticity of Acts xvi.-xxi. is disputed. The authorship of the Celestina and the date of its composition are doubtful. An anonymous prefatory letter in the edition subsequent to 1501 attributes the book to Juan de Mena or Rodrigo Cota, but this ascription is universally rejected. The prevailing opinion is that the author of the twenty-one acts was Fernando de Rojas, apparently a Spanish Jew resident at the Puebla de Montalban in the province of Toledo; R. Fouche-Delbose, however, maintains that the original sixteen acts are by an unknown writer who had no part in the five supplementary acts. Some scholars give 1483 as the date of composition; others base this for the book was written in 1497. These questions are still unsettled. Though profoundly original in treatment, the Celestina has points of analogy with the work of earlier writers, such as Juan Ruiz (q.v.), the archpriest of Hita; his rapid sketches of Trota-ventanas, Melon and Endrina no doubt suggested the finished portraits of Celestina, Calisto and Melibea, and the closing scene in the Celestina recalls the suicide in Diego Fernandez de San Pedro's Cercel de Amor. Allowing for these and other debts of the same kind, it cannot be denied that the Celestina excels all earlier Spanish works in tragic force, in expressive conception, and in the realistic rendering of characters drawn from all classes of society. It passed through innumerable editions in Spain, and was the first Spanish book to find acceptance throughout western Europe. At least twenty works by well-known Spanish authors are derived from it; it was adapted for the English stage as early as 1525-1530, and was translated into Italian (1505), French (1527) and other European languages. A Latin version by Caspar Barth was issued under the title of Parnoeboscidellus calasus latinus (1624) with all the critical apparatus of a recognized classic. James Mabbe's English rendering (1631) was one of the best translations ever published. The original edition of 1490 has been reprinted by R. Fouche-Delbose in the Bibliotheca Hispanica (1902), vol. xii.

CELESTE (Calestius), the name of five popes.

CELESTE I., pope from 422 to 432. At his accession the dissensions caused by the factions of Eulalius (see BONIFACE I.) had not yet abated. He, however, triumphed over them, and his episcopate was peaceful. When the doctrines of Nestorius were denounced to him, he instructed Cyril, bishop of Alexandria, to follow up the matter. The emperor Theodosius II. convened an ecumenical council at Ephesus, to which Celeste sent his legates. He had some difficulties with the bishops in Africa on the question of appeals to Rome, and with the bishops of Provence with regard to the doctrines of St Augustine. To expedite the extirpation of Pelagianism, he sent to Britain a deacon called Palladius, at whose instigation St Germanus of Auxerre crossed the English Channel, as delegate of the pope and bishops of Gaul, to inculcate orthodox principles upon the clergy of Britain. He also commissioned Palladius to preach the gospel in Ireland which was beginning to rally to Christianity. Celestine was the first pope who is known to have taken a direct interest in the churches of Britain and Ireland.

CELESTE II., pope in 1143-1144. Guido di Città di Castello (Tiferno), born of noble Tuscan family, able and learned, studied
under Abelard and became a cardinal priest. Elected the successor of Innocent II. on the 26th of September 1134, he died on the 6th of March following. He removed the interdict which Innocent had employed against Louis VII. of France. At the time of his death he was on the verge of a controversy with Roger of Sicily.

CELESTINE III. (Giacinto Bobo), pope from 1101 to 1108, was cardinal deacon of Santa Maria in Cosmedin as early as 1144, and had reached the age of eighty-five when chosen on the 30th of March 1101 to succeed Clement III. The first pope of the house of the Orsini, his policy was marked by mildness and indecision. Henry VI. of Germany at once forced the pontiff to crown him emperor, and three or four years later took possession of the Norman kingdom of Sicily; he refused tribute and the oath of allegiance, and even appointed bishops subject to his own jurisdiction; moreover, he gave his brother in fief the estates which had belonged to the countess Matilda of Tuscany. Celestine did not dare so much as to threaten him with excommunication. It was Celestine's purpose to lay England under the interdict; but Prince John and the barons still refused to recognize the papal legate, the bishop of Ely. Richard I. had been set free before the dilatory pope put Leopold of Austria under the ban. In his last sickness Celestine wished to resign his office, but the cardinals protested. Death released him from his perplexities on the 8th of January 1108.

CELESTINE IV. (Godfrey Castiglione), pope in 1241, son of a sister of Urban III. (1185-1187), was archpriest and chancellor at Milan. After Urban's death he entered the Cistercian monastery at Hautecombe in Savoy. In 1227 Gregory IX. created him cardinal priest of St. Mark's, and in 1233 made him cardinal bishop of Sabina. Elected to succeed Gregory on the 25th of October 1241, he died on the 10th of November, before consecration, and was buried in St. Peter's.

See A. Pothast, Regesta Pontificum Romanorum, vol. i. (Berlin, 1874), 340 ff. (W. R. W.)

CELESTINE V. (St Peter Celestine), pope in 1260, was born of poor parents at Isernia about 1215, and early entered the Benedictine order. Living as a hermit on Monte Morrone near Sulmon in the Abruzzi, he attracted other ascetics about him and organized them into a congregation of the Benedictines which was later called the Celestines (q.v.). The assistance of a vicar enabled him to escape from the growing administrative cares and devote himself solely to asceticism, apparently the only field of human activity in which he excelled. His Opuscula, published by Telera at Naples in 1640, are probably not genuine; he was indigitus libris. A fight between the Colonna and the Orsini, as well as hopeless dissensions among the cardinals, prevented a papal election for two years and three months after the death of Nicholas IV. Charles II. of Naples, needing a pope in order that he might regain Sicily, brought about a concord. As the election of any cardinal seemed impossible, on the 5th of July 1261, Celestine was elected on the 5th of July. The cardinals expected to rule in the name of the celebrated but incapable ascetic. Apocalyptic notions then current doubtless aided his election, for Joachim of Floris and his school looked to monasticism to furnish deliverance to the church and to the world. Multitudes came to Celestine's coronation at Aquila, and he began his reign the idol of visionaries, of extremists and of the populace. But the pope was in the power of Charles II. of Naples, and became his tool against Aragon. The king's son Louis, a layman of twenty-one, was made archbishop of Lyons. The cardinals, scarcely consulted at all, were discontented. The pope, who wanted more time for his devotions, offered to leave three cardinals in charge of affairs; but his proposition was rejected. He then wished to abdicate, and at length Benedict Gaetano, destined to succeed him as Boniface VIII., removed all scruples against this unheard-of procedure by finding a precedent in the case of Clement I. Celestine abdicated on the 13th of December 1294. There is no sufficient ground for finding an allusion to this act in the noted line of Dante, "Che fece per viltate il gran rifiuto" ("who made from cowardice the great refusal," Inferno, c. 65). Boniface at length put him in prison for safe keeping; he died in a monastic cell in the castle of Fumone near Anagni on the 10th of May 1296. He was canonized by Clement V. in 1313.

See J. Wezetser and Werle and Herzog-Hauck (with excellent bibliography) as above; Jean Aurélien, Supérieur de la Congrégation des Célestins, La Vie admirable de . . . Saint Pierre Célestin (Bar-le-Duc, 1872); H. Finke, Aus den Tagen Bonifats VIII. (Münster, 1905), pts. 24-43.

CELESTINE, or Celestite, a name applied to native strontium sulphate (SrSO₄), having been suggested by the celestine blue colour which it occasionally presents. This colour has been referred to a trace of iron phosphate, but in some cases such an explanation appears doubtful. The mineral is usually colourless, or has only a delicate shade of blue. Celestine crystallizes in the orthorhombic system, being isomorphous with barytes (q.v.). The angle between the prism faces is 76° 17'. The cleavage is perfect parallel to the basal pinacoid, and less marked parallel to the prism. Although celestine much resembles barytes in its physical properties, having for example the same degree of hardness (3), it is less dense, its specific gravity being 3-9. Celestine is a less abundant mineral than barytes. It is, however, much more soluble, and occurs frequently in mineral waters. W. W. Stoddard showed that many plants growing on mineral deposits containing celestine near Bristol appropriated the strontium salt, and the metal could be detected spectroscopically in their ashes.

Celestine occurs in the Triassic rocks of Britain, especially in veins and geodes in the Keuper marl in the neighbourhood of Bristol. At Wickwar and Yate in Gloucestershire it is worked for industrial purposes. Colourless crystals, of great beauty, occur in association with calcite and native sulphur in the sulphur deposits of Sicily, as at Girgenti. Fine blue crystals are yielded by the copper mines of Herrangrund, in Hungary; a dark blue fibrous form is known from Jena; and small crystals occur in flint at Meudon near Paris. Very large tabular crystals are found in limestone on Strontian Island in Lake Erie; and a blue fibrous variety from near Frankstown, Blair Co., Penn., is notable as having a rich celestine colour on which the species was founded by A. G. Werner in 1798.

Celestine is much used for the preparation of strontium hydrate, which is employed in refining beetroot sugar in Germany. The mineral is used also as a source of various salts of strontium such as the nitrate, which finds application in pyrotechny for the production of red fire. (F. W. R.)

CELESTINES, a religious order founded about 1260 by Peter of Morrone, afterwards Pope Celestine V. (1294). It was an attempt to unite the eremitical and cenobitical modes of life. Peter's first disciples lived as hermits on Mount Majella in the Abruzzi. The Benedictine rule was taken as the basis of the life, but was supplemented by regulations notably increasing the austerities practised. The form of government was borrowed largely from those prevailing in the mendicant orders. Indeed, though the Celestines are reckoned as a branch of the Benedictines, there is little in common between them. For all that, St Celestine, during his brief tenure of the papacy, tried to spread his ideas among the Benedictines, and induced the monks of Monte Cassino to adopt his ideal of the monastic life instead of St Benedict's; for this purpose fifty Celestine monks were introduced into Monte Cassino, but on Celestine's abdication of the papacy the project fortunately was at once abandoned. During the founder's lifetime the order spread rapidly, and eventually
there were about 150 monasteries in Italy, and others in France, Bohemia and the Netherlands. The French houses, twenty-one in number, formed a separate congregation, the head-house being in Paris. The French Revolution and those of the 19th century destroyed their houses, and the Celestine order seems no longer to exist.

Peter of Morrone was in close contact with the Franciscan Spirituals of the extreme type (see Francisca), and he endeavoured to form an amalgamation between them and his hermits, under the title “Poor Hermits of Celestine.” On his abdication the amalgamation was dissolved, and the Franciscan element fled to the East and was finally suppressed by Boniface VIII. and compelled to re-enter the Franciscan order. The habit of the Celestines was black.

CELIBACY (Lat. caelibatus, from caelebs, unmarried), the state of being unmarried, a term now commonly used in the sense of complete abstinence from marriage; it originally included the state of widowhood also, and any one who was caelebs had no existing spouse. Physicians and physiologists have frequently discussed celibacy from the point of view; but it will be sufficient to note here the results of statistical inquiries. It has been established by the calculations of actuaries that married persons—women in a considerable, but men in a much greater degree—have at all periods of life a greater probability of living than the single. From the point of view of public utility, the state has sometimes attempted to discourage celibacy. The best-known enactment of this kind is that of the emperor Augustus, best known as Lex Julia et Papia Poppaeae. This disabled caelebs from receiving an inheritance unless the testator were related to them within the sixth degree; it limited the amount which a wife could take by a husband’s will, or the husband by the wife’s, unless they had children; and preference was given to candidates for office in proportion to the number of their children. Ecclesiastical legislators, on the other hand, have frequently favoured the unmarried state; and celibacy, partial or complete, has been more or less stringently enforced upon the ministers of different religions; many instances are quoted by H. C. Lea. The best known, of course, are the Roman Vestal Virgins, who never married, and the manicae, the privileges accorded to these maidens were often insufficient to keep them filled. In the East, however, this and other forms of asceticism have always flourished more freely; and the Buddhist monastic system is not only far older than that of Christendom, but also proportionately more extensive. In early Judaism, chastity was indeed enjoined upon the priests at certain solemn seasons; but there was no attempt to enforce celibacy upon the sacerdotal caste. On the contrary, all priests were the sons of priests, and the case of Elizabeth shows that here, as throughout the Jewish people, barrenness was considered a disgrace. But Alexander’s conquests brought the Jews into contact with Hindu and Greek mysticism; and this probably explains the growth of the ascetic Essenes some two centuries before the Christian era. The adherents of this sect, unlike the Pharisees and Sadducees, were never denounced by Christ, who seems on the contrary to have had real sympathy with the voluntary celibacy of an exceptional few (Matt. xix. 11). St Paul’s utterances on this subject, though they go somewhat further, amount only to the suggestion that godliness be coupled with virginity. He find more freedom in his work in the absence of wives and children. In the same time, St Paul clamed emphatically for himself and the other apostles the right of leading about a wife; and he names

2. In the 14th century, the city of Ichi, in Chinese Tartary, possessed 14 monasteries, averaging 3000 devotees in each; while in Tibet, at the present time, there are in the vicinity of Lhasa 12 great monasteries, containing a population of 18,600 lamas. In Ladak the proportion of lamas to the laity is as 1 to 13, in Spiti 1 to 7, and in Burmah 1 to 30. (Lea i. 103.)

among the qualifications for a bishop, an elder and a deacon, that he should be “the husband of one wife.” Indeed it was freely admitted by those learned in the middle ages and Renaissance that celibacy had been no rule of the apostolic church; and, though writers of ability have attempted to maintain the contrary even in modern times, their contentions are unhesitatingly rejected by the latest Roman Catholic authority. The gradual growth of clerical celibacy, first as a custom and then as a rule of discipline, can be traced clearly enough even through the scanty records of the first few centuries. The most ascetic Christians began to question the legality of second marriages on the part of either sex, as even paganism had often reproved second marriages of women. Though these extremists were presently branded as heretics for their eccentric ultra-ascetic tenets (Montanists, Cathari), yet as early as Tertullian’s time (c. A.D. 220) the right of second marriages was theoretically denied to the priesthood. This was logically followed by a revival of the old Levitical rule which required that priests should marry none but virgins (Lev. xxii. 7, 13). Both these rules, however, proved difficult of enforcement and seem to have rested only on a vague basis of public opinion; twice-married men (digami) were admitted to the priesthood by Pope Calixtus I. (219-222). Thenceforth, until the 5th century we find husbands of widows consecrated to the episcopate. The so-called Apostolical Constitutions and Canons, the latter of which were compiled in the 4th century, give us the first clear and fairly general rules on the subject. Here we find “bishops and priests allowed to retain the wives whom they may have had before ordination, but not to marry in orders; the lower grades, deacons, subdeacons, &c., allowed to marry after entering the church; but all were to be husbands of but one wife, who must be neither a widow, a divorced woman nor a concubine” (Lea i. 28). Many causes, however, were already at work to carry public feeling beyond this stage. Quite apart from the few enthusiasts who would have given a literal interpretation to the text in Matt. xix. 12, vows of virginity became more and more frequent as the virtue itself was lauded by ecclesiastical writers in language of increasing fervour. These vows were at first purely voluntary and temporary; but public opinion naturally grew less and less tolerant of those who, having once formed and published so solemn a resolution, broke it afterwards. Again not only was the church doctrine itself more or less consciously influenced by the Manichean tenet of the diabolical origin of all matter, including the human body, but individuated the natural tendency to compete in asceticism with the many heretics who held this tenet, and whose admission brought them so much popular consideration. Moreover, in proportion as the clergy, no longer mere ringleaders of a despised and persecuted sect, became beneficiaries and administrators of rich endowments—and this at a time when the external safeguards against embezzlement were comparatively weak—a strong feeling grew up among the laity that church revenues should not go to support the priest’s family. Lastly, such partial attempts as we have already described to enforce upon the clergy a special rule of continence, by their very failure, suggested more heroic measures. Therefore, side by side with the evidence for difficult enforcement of the old rules, we find an equally constant series of new and more stringent enactments.

The first church council which definitely forbade marriage to the higher clergy was the local Spanish synod of Elvira (A.D. 305). A similar interpretation has sometimes been claimed for the third canon of that general council of Nicaea to which we refer above, p. 4, n. 5; Tim. iii. 11, 12; Titus i. 6; E. Vacandard in Dict. d. Théol. Cath., s.v. “Celibacy.”

3. This was a natural argument for the defenders of clerical celibacy even in far later times. St Bonaventura (d. 1274) puts this very strongly: “For if archbishops and bishops now had children, they would rob and plunder all the goods of the Church so that little or nothing would be left for the poor. For since they now heap up wealth and enrich nephews removed from them by almost incalculable degrees of affinity, what would they do if they had legitimate children? . . . Therefore the Holy Ghost in His providence hath removed this stumbling-block,” &c. &c. (In Sent. lib. iv. dist. xxxvii art. i. quaest. 3).
CELIBACY

The best authorities on all sides. There can be no doubt, however, that the 4th century opened a wide breach in this respect between the Eastern and Western churches. The modern Greek custom is "(a) that most candidates for Holy Orders are dismissed from the episcopal seminaries shortly before being ordained deacons, in order that they may marry (their partners being in fact mostly daughters of clergy); and, after their marriage, return to the seminaries in order to take the higher orders; (b) that, as priests, they still continue the marriages thus contracted, but may not remarry on the death of their wife; and (c) that the Greek bishops, who may not continue their married life, are commonly not chosen out of the ranks of the married secular clergy, but from among the monks." The Eastern Church, therefore, still adheres fairly closely to the rules laid down by the Apostolical Canons in the 4th century. In the West, however, a decisive forward step was taken by Pope Damasus and Sisirius during the last quarter of that century. The famous decretal of Sisirius (385) not only enjoined strict celibacy on bishops, priests and deacons, but insisted on the instant separation of those who had already married, and prescribed the punishment of expulsion for disobedience (Sicr. Ep. i. c. 7, Migne, P.L. xii. col. 1138). Although we find Sisirius a year later writing to an African Church on this same subject, in tones rather more permissive than his predecessors, yet the beginning of compulsory sacerdotal celibacy in the Western Church may be conveniently dated from his decretal of A.D. 385. Leo the Great (d. 461) and Gregory the Great (d. 604) further extended the rule of celibacy to subdeacons.

For the next three or four centuries there is little to note but the continual evidence of open or secret resistance to these decrees, and the parallel frequency and stringency of ecclesiastical legislation, which by its very monotony bears witness to its own want of success. At least seven episcopal constitutions of the 8th and 9th centuries forbade the priest to have even his mother or his sister in the house.2 Nor did the only difficulty lie in such secret breaches of the law; in many districts the priesthood tended to become a mere hereditary caste, to the disadvantage of church and state alike. In northern and southern Italy public clerical marriages were extremely frequent, whether with or without regular forms.3 The see of Rouen was held for more than a century (942-1054) by three successive bishops who were fathers, brothers, and sons of persons who were or had been married. In England St. Swithun (d. 862) was married, though very likely by special papal dispensation; and the married clergy were apparently predominant in Alfred's time. In spite of Dunstan's reforms at the end of the 10th century, the Norman Lanfranc found so many wedded priests that he dared not decree their separation; and when his successor St. Anselm attempted to go further, this seemed a perilous novelty even to so distinguished an ecclesiastic as Henry of Huntingdon, who wrote: "About Michaelmas of this same year (1102) Archbishop Anselm held a council in London, wherein he forbade wives to the English priesthood, heretofore not forbidden; which seemed to some a matter of great purity, but to others a perilous thing, lest the clergy, in striving after a purity too great for human strength, should fall into horrible impurity, to the extreme dishonour of the Christian name." (lib. vii.; Migne, P.L. ccxxvi. col. 944).

Yet this was at a time when the decisive and continued action of two great popes ought to have left no possible doubt as to the law of the church.

The growing tendency of the clergy to look up to their endow-

ments as hereditary fiefs, their consequent worldliness and (it must be added) their vices, aroused the indignation of two very able men in the latter half of the 11th cent. St. Pietro Damiani (988-1072) was a scholar, hermit and refor-

mer, who did more perhaps than any one else to combat the open marriages of the clergy. He complained that exhortation was wasted even on the bishops, "because they despair of attaining to the pinnacle of chastity, and have no fear of condemnation in open synod for the vice of lechery. .. If this evil were secret [he adds], it might perhaps be borne,"4 His Liber Gomorrhianus, addressed to and approved by St. Leo IX., is sufficient in itself to explain the vehemence of his crusade, though it emphasizes even more strongly the impolicy of proceeding more severely against the open marriages of the clergy than against concubinage and other less public vices.5 Damiani found a powerful ally in the equally ascetic but far more imperious and statesmanlike Hildebrand, afterwards Pope Gregory VII. Under the influence of these two men, five successive popes between 1045 and 1073 attempted a radical reform; and when, in this latter year, Hildebrand himself became pope, he took measures so stringent that he has sometimes been erroneously represented not merely as the most uncompromising champion, but actually as the author of the strict rule of celibacy which has been so persistently adhered to by the clergy.

But these heroic measures soon caused serious embarrassment. If the laity were to stand aloof from all incontinent priests, while (as the most orthodox churchmen constantly complained) many priests were still incontinent, then this could only result in exactly the opposite effect, to the very priest himself. The clergy, in the struggle for the defense of the faith, not only would find itself deserted by the laity, but, as was soon afterwards experienced, by the popes themselves. It became necessary, therefore, to soften a policy which to the lay mind might imply that the virtue of a sacrament was weakened by the vices of its ministers; and, whereas Peter Lombard (d. 1160) concludes that no excommunicated priest can effect transsubstantiation, St. Thomas Aquinas (d. 1274) agrees with all the later Schoolmen in granting him that power, though to the peril of his own soul.6 For, by the last quarter of the 13th century, the struggle had entered upon a new phase. The severest measures had been tried, especially against the priests' unhappy partners. As early as the council of Augsburg (952) these were condemned to be scourged, while Leo II. and Urban II., at the councils of Rome and Amalfi (1051, 1089),

1 Hefele, Beitraege zur Kirchengesch. usw. i. 139.
2 See the quotations in Lea i. 136. These prohibitions were renewed in the 13th and 14th centuries (ibid. i. 410).

6 Opusc. xvii. praef. The saint's evidence is carefully weighed by Dresdner (i.e.), especially on pp. 309 ff. and 321 ff. Even Pope Innocent III. was compelled to decide that priests who had kept two or more concubines successively or simultaneously, did not thereby incur the disabilities which attached diploma-; or, in other words, that a layman who had contracted two lawful marriages and then proceeded to ordination on the death of his second wife, could be absolved only by the pope; whereas the concubine of a priest, "as a man married with simple concubinage with the occur to a is to prosecute the ascetic ideal, saw more clearly than any other the enormous increase of influence which would accrue to a strictly celibate body of clergy, separated by their very ordination from the strongest earthly ties; and no statesman has ever pursued with greater energy and resolution a plan once formulated. In order to break down the desperate, and in many places organized, resistance of the clergy, he did not shrink from the perilous course, so contrary to his general policy, of subjecting them to the judgment of the laity. Not only were concubinaries—a term which was now made to include also those who had openly married—forced to serve at the altar and threatened with actual deposition in cases of contumacy, but the laity were warned against attending mass said by "any priest certainly known to keep a concubine or subintroducta." 

7 Opusc. xvii. praef. The saint's evidence is carefully weighed by Dresdner (i.e.), especially on pp. 309 ff. and 321 ff. Even Pope Innocent III. was compelled to decide that priests who had kept two or more concubines successively or simultaneously, did not thereby incur the disabilities which attached diploma-; or, in other words, that a layman who had contracted two lawful marriages and then proceeded to ordination on the death of his second wife, could be absolved only by the pope; whereas the concubine of a priest, "as a man married with simple concubinage with the occur to a is to prosecute the ascetic ideal, saw more clearly than any other the enormous increase of influence which would accrue to a strictly celibate body of clergy, separated by their very ordination from the strongest earthly ties; and no statesman has ever pursued with greater energy and resolution a plan once formulated. In order to break down the desperate, and in many places organized, resistance of the clergy, he did not shrink from the perilous course, so contrary to his general policy, of subjecting them to the judgment of the laity. Not only were concubinaries—a term which was now made to include also those who had openly married—forced to serve at the altar and threatened with actual deposition in cases of contumacy, but the laity were warned against attending mass said by "any priest certainly known to keep a concubine or subintroducta."
adjudged them to actual slavery. Such enactments naturally defeated their own purpose. More was done by the gentler methods of moral restraint of the Franciscans and Dominicans in the 13th century; but St Thomas Aquinas had seen half a century of that reform and had recognized its limitations; he therefore attenuated as much as possible the decree of Nicholas II. His contemporary St Bonaventure complained publicly that he himself and his fellow-friars were often compelled to hold their tongues about the evil clergy; partly because, even if one were expelled, another equally worthless would probably take his place, but "perhaps principally lest, if the people altogether lost faith in the clergy, heresies should arise and draw the people to themselves as sheep that have no shepherd, and make heresies of them, boasting that, as it was by our own testimony, the clergy were so vile that none need obey them or care for their teaching."

In other passages of his works St Bonaventure tells us plainly how little had as yet been gained by suppressing clerical marriages; and the evidence of orthodox and distinguished churchmen for the next centuries is equally decisive. Alvarez Pelayo, a Spanish bishop and papal penitentiary, wrote in 1352, "The clergy sin commonly in these following ways . . . fourthly, in that they live very incontinently, and would if they had never promised continence especially in Spain and southern Italy, in which provinces the sons of the laity are scarcely considered. Thus, among the clergy of Seville, Pierre d'Alilly pleaded before the council of Constance in 1415 for the reform of "that most scandalous custom, or rather abuse, whereby many [clergy] fear not to keep concubines in public."

Meanwhile, as has been said above, the custom of open marriage among clergy in holy orders (priests, deacons and subdeacons) was gradually stamped out. A series of synods, from the early 12th century onwards, declared such marriages to be not only unlawful, but null and void in themselves. Yet the custom lingered sporadically in Germany and England until the last few years of the 13th century, though it seems to have died out earlier in France and Italy. There was also a short-lived attempt to declare that even a clerk in lower orders should lose his clerical privileges on his marriage; but Boniface VIII. in 1300 definitely permitted such marriages under the already-quoted conditions of the Apostolic Canons; in these cases, however, a bishop's licence was required to enable the cleric to officiate in church, and the episcopal registers show that the diocesan churchmen were often too lenient in the celibacy of parish-clerks. As the middle ages drew to a close, earnest churchmen were compelled to ask themselves whether it would not be better to let the priests marry than to continue a system which concubinage was even licensed in some districts. Serious proposals were made to reintroduce clerical marriage at the great reforming councils of Constance (1415) and Basel (1431), but the overwhelming majority of orthodox churchmen were unwilling to abandon a rule for which they had fought during so many centuries, and to which many of them probably attributed an apostolic origin. This conservative attitude was inevitably strengthened by the attacks first of Lollard and then of Lutheran heretics; and Sir Thomas More was driven to declare, in answer to Tyndale, that the marriage of priests, being essentially null and void, "defileth the priest more than double or treble whoredom." It is well known that this became one of the most violently disputed questions at the Reformation, and that for eight years it was felony in England to defend sacerdotal marriage as permissible by the law of God. (Statute of the Six Articles, 31 Hen. VIII. c. 14). The diversity of practice on this point drew one of the sharpest lines between reformers and orthodox, until the disorders introduced by these religious wars tempted the latter to imitate in considerable numbers the licence of their rivals. This moved the emperor Charles V. to obtain from Paul III. dispensations for married priests in his dominions; and his successor Ferdinand, with the equally Catholic sovereigns of France, Bavaria and Poland, pleaded strongly at the council of Trent (1545) for permissive marriage. The council, after some hesitation, took the contrary course, and in the 9th canon of its 24th session it erected sacerdotal celibacy permissively, if not formally, into an article of faith. In England, this, like the other, the emperor Joseph II opened the question in 1783. In France the revolutionary constitution of 1791 abolished all restrictions on marriage, and during the Terror celibacy often exposed a priest to suspicion as an enemy to the Republic; but the better part of the clergy steadily resisted this innovation, and it is estimated that only about 2% were married. The Old Catholics adopted the principle of sacerdotal marriage in 1785.

The working of the system in modern times is perhaps too controversial a question to be discussed here; but one or two points may be noted on which all fairly well informed writers would probably agree. It can scarcely be denied that the Roman Catholic clergy have always owed much of their influence to their celibacy, and that in many cases this influence has been most justly earned by the celibate's devotion to an unworthy ideal. Again, the most adverse critics would admit that much was done by the counter-Reformation, and that modern ecclesiastical discipline on this point is considerably superior to that of the middle ages; while, on the other hand, many authorities of undoubted orthodoxy are ready to confess that it is not free from serious risks even in these days of easy publicity and stringent civil discipline. Lastly, statistical research has shown that the children of the married British clergy have been distinguished far beyond their mere numerical proportion.

### Authorities

- Henry Charles Lea, *History of Sacerdotal Celibacy* (3rd ed., 1907, 2 vols.), is by far the fullest and best work on this subject, though a good deal of important matter omitted by Dr Lea may be found in *Die Einführung der erzwungenen Ehelosigkeit* by the brothers Johann Anton and Augustin Theiner, which was put into German by *Ein Index der Grundsätzten* (1895, 2 vols.). The history of monastic celibacy has not yet been treated anywhere; the most important evidence of the episcopal registers is either still in MS. or has been published only in comparatively recent years. The most learned work on clerical celibacy from the sixteenth century to our own day is that of Francesco Antonio Zaccaria, *Storia Polonica del celibato sacro* (Rome, 1774); but much of his most important

---

1. Labbe-Mansi, *Concilia*, vol. xix. col. 796 and xx. col. 724. Dr Lea is probably right in suggesting that Dr Lea was more tolerant of this than his predecessor, who only condemned the canon. For Dr Lea, the license was "null and void," whereas the canon of 1300 is quoted as allowing the marriage, with the condition that the bishop grant a license. This seems to indicate that the position of the church was somewhat more flexible in the 13th century than in the 14th.
2. Strype, *Memorials of Cranmer*, bk iii. c. 28 (ed. 1812, vol. i. p. 601) (first published in *Lea's Historical Archiv.*); and *Quaest. Praed. Minores praed.:* The first visitation of his friend Odo Rigali, archbishop of Rouen, shows that about 15% of the parish clergy in that diocese were notoriously incestuous (Regestum Visitatioum, ed. Bonnin, Rouen, 1852, p. 17). Odo Rigali, however, is quoted as having made a record as to the progress made during the half-century before Odo's time. It is probable that there were more offenders than these 15% known to the archivist.
3. *De Planctu Ecclesiae*, ed. 1517, f. 1313 (col. 2); cf. f. 102b, col. 2; Hermann von der Hardt, *Constantiensis Concilii*, etc. vol. i. pars. vii. col. 428.
4. *A more or less irregular list of licences by bishops and archbishops of the days of Gregory VII. to the 16th century: see index to Lea, s.v. "Licences." Dr Lea has, however, omitted the most striking authority of all, Gascoigne, the most distinguished Oxford chancellor of his day, writing about 1140 of John de la Bere, then archbishop of Canterbury, "... and the clergy of his diocese from their concubines, giving publicly as his reason, "for then thy bishop should lose the 400 marks which I receive yearly in my diocese for the priests' licenses." (Gascoigne, *Lib. Ver. us. Rogers*, p. 36). In 1175 Thomas More, bishop of Coventry, against the Reformers, admitted that this concubinage was too often tolerated in Wales (English Works, ed. 1557, p. 231, cf. 619).
conclusions are set aside by the abbé V. Vacandard in his contribution to the Dictionnaire de théologie catholique (vol. ii. art. "Célèbre ecclésiastique").

CELL (from Lat. colla, probably from an Indo-European kōl—seen in Lat. cælare, to hide; another suggestion connects the word with Lat. cera, wax, taking the original meaning to refer to the honeycomb), in its earliest application a small detached room in a building, particularly a small monastic house (see ABBEY), generally in the country, belonging to large conventual buildings, and intended for change of air for the monks, as well as places to reside in to look after the lands, vassals, &c. Thus Tynemouth was a cell to St Albans; Ashwell, Herts, to Westminster Abbey. The term was also used of the small sleeping apartments of the monks, or a small apartment used by the anchorite or hermit. This use still survives in the application to the small separate chambers in a prison (q.v.) in which prisoners are confined. The word is applied to various small compartments which build up a compound structure such as a honeycomb, to the minute compartments in a tissue, &c. More particularly the word is used, in electrical science, of the single constituent compartments of a voltaic battery (q.v.), and in biology of the living units of protoplasm of which plants and animals are composed (see CYTOTOLOGY).

CELLA, in architecture the Latin name for the sanctuary of a Roman temple, corresponding with the naos of the Greek temple. In the Etruscan temples, according to Vitruvius, there were three cells, cella by side; and in the temple of Venus built by Hadrian at Rome there were two cells, both enclosed, however, in a single peristyle.

CELLARET (i.e. little cell), strictly that portion of a sideboard which is used for holding bottles and decanters, so called from a cella (which in general may be any underground unlighted apartment being commonly used for keeping wine. Sometimes it is a drawer, divided into compartments lined with zinc, and sometimes a cupboard, but still an integral part of the sideboard. In the latter part of the 18th century, when the sideboard was in process of evolution from a side-table with drawers into the large and important piece of furniture which it eventually became, the cellaret was a detached receptacle. It was most commonly of mahogany or rosewood, many-sided or even octagonal, and occasionally oval, bound with broad bands of brass and lined with zinc partitions to hold the ice for cooling wine. Sometimes a tap was fixed in the lower part for drawing off the water from the melted ice. Cellarets were usually placed under the sideboard, and were, as a rule, handsomely proportioned; but as the artistic impulse which created the great 18th-century English school of furniture died away, their form grew debased, and under the influence of the English Empire fashion, which drew its inspiration from a bastard classicism, they assumed the shape of sarcophagi incongruously mounted with lions' heads and claw-feet. Hepplewhite called them "gardes du vin"; they are now nearly always known as "wine-coolers."

CÉLLE, a town of Germany, in the Prussian province of Hanover, on the left bank of the navigable Aller, near its junction with the Fuze and the Lachte, 23 m. N.E. of Hanover, on the main Lehrte-Hamburg railway. Pop. (1905) 21,400. The town has a Roman Catholic and a Protestant church, among the latter the town-church with the burial vault of the dukes of Lüneburg-Celle. Here rest the remains of Sophia Dorothea, wife of the elector George of Hanover, afterwards George I. of England, and those of Caroline Matilda, the divorced wife of Christian VII. of Denmark and sister of George III. of England, who resided here from 1722 until her death in 1775. The most interesting building in Celle is the former ducal palace, begun in 1485 in Late Gothic style, but with extensive Renaissance additions of the close of the 17th century. The building of the court of appeal (Oberlandesgericht), with a valuable library of 60,000 volumes and many MSS., including a priceless copy of the Sachsenspiegel, the museum and the hall of the estates (Landschaftshaus) are also worthy of notice. There are manufactures of woolen yarn, tobacco, biscuits, umbrellas and printers' ink, and a lively trade is carried on in wax, honey, wool and timber. Celle is the seat of the court of appeal from the superior courts of Aurich, Detmold, Göttingen, Hanover, Hildesheim, Lüneburg, Osnabrück, Stade and Verden. Founded in 1292, the town was the residence of the dukes of Lüneburg-Celle, a cadet branch of the ducal house of Brunswick, from the 14th century until 1705.

See Dehning, Geschichte der Stadt Celle (Celle, 1891).

CELLIER, ALFRED (1844-1891), English musical composer, was born at Hackney on the 1st of December 1844. From 1855 to 1860 he was a chorister at the Chapel Royal, St James's, under the Rev. Thomas Helmore, where Arthur Sullivan was one of his youthful colleagues. His first appointment was that of organist at All Saints' church, Blackheath (1862). In 1866 he succeeded Dr Chipp as the conductor of the Ulster Hall concerts, Belfast, at the same time acting as conductor of the Belfast Philharmonic Society. In 1868 he returned to London as organist of St Alban's, Holborn. From 1871 to 1875 he was conductor at the Prince's theatre, Manchester; and from 1877 to 1879 at various London theatres. During this period he composed many comic operas and operettas, of which the most successful was The Sultan of Moja, which was produced at Manchester in 1874, in London at St James's theatre in 1876, and revived at the Strand theatre in 1887. In 1880 Cellier visited America, producing a musical version of Longfellow's Masque of Pandora at Boston (1881). In 1883 his setting of Gray's Elegy in the form of a cantata was produced at the Leeds Festival. In 1886 he won the great success of his life in Dorothy, a comic opera written to a libretto by B. C. Stephenson, which was produced at the Gaiety theatre on the 25th of September 1886, and, transferred first to the Prince of Wales theatre and subsequently to the Lyric theatre, ran until April 1889. Doris (1889), and The Mountebanks, which was produced in January 1892, a few days after the composer's death, were less successful. Cellier owed much to the influence of Sir Arthur Sullivan. He had little of the latter's humour and vivacity, but he was a fertile melodist, and his writing is invariably distinguished by elegance and refinement. He died in London on the 28th of December 1891.

CELLINI, BENVENUTO (1500-1571), Italian artist, metal worker and sculptor, was born in Florence, where his family, originally landowners in the Val d'Ambra, had for three generations been settled. His father, Giovanni Cellini, was a musician and artificer of musical instruments; he married Maria Lisabetta Giordani, and, according to his memoirs, his wife had no idea of anyone but himself. Cellini was the second child. The father destined him for the same profession as himself, and endeavoured to thwart his inclination for design and metal work. When he had reached the age of fifteen his youthful predilection had become too strong to be resisted, and his father reluctantly gave consent to his being apprenticed to a goldsmith, Antonio di Sandro, named Marcone. He had already attracted some notice in his native place, when, being implicated in a fray with some of his companions, he was banished for six months to Siena, where he worked for Francesco Castoro, a goldsmith; from thence he removed to Bologna, where he became a more accomplished flute-player and made progress in the goldsmith's art. After visiting Pisa, and after twice resettling for a while in Florence (where he was visited by the sculptor Torrigiano, who unsuccessfully suggested his accompanying him to England), he decamped to Rome, aged nineteen. His first attempt at his craft here was a silver casket, followed by some silver candlesticks, and later by a vase for the bishop of Salamanca, which introduced him to the favourable notice of Pope Clement VII. He had probably worked, the gold medallion of "Leda and the Swan,"—the head and torso of Leda cut in hard stone—executed for Gonfaloniere Gabriello Cesarino, which is now in the Vienna museum; he also converted to music, practised flute-playing, and was appointed one of the pope's court-musicians. In the attack upon Rome by the constable de Bourbon, which occurred immediately after, in 1527, the bravery and address of Cellini proved of signal service.
to the pontiff; if we may believe his own accounts, his was the very hand which shot the Bourbon dead, and he afterwards killed Philip II., prince of Orange. His exploits paved the way for a reconciliation with the Florentine magistrates, and his return shortly after to his native place. Here he assiduously devoted himself to the execution of medals, the most famous of which (executed a short while later) are "Hercules and the Nemean Lion," in gold repoussé work, and "Atlas supporting the Sphere," in chased gold, the latter eventually falling into the possession of Francis I. From Florence he went to the court of Mantua, and thence again to Florence and to Rome, where he was employed not only in the working of jewelry, but also in the execution of dies for private medals and for the papal mint. Here in 1529 he avenged a brother's death by slaying the slayer; and shortly afterwards had to flee to Naples to shelter himself from the consequences of an affray with a notary, Ser Benedetto, whom he wounded. Through the influence of several of the cardinals he obtained a pardon; and on the elevation of Paul III. to the pontifical throne he was reinstated in his former position of favour, notwithstanding a fresh homicide of a goldsmith which he had committed more by accident than of malice prepense in the interregnum. Once more the plots of Pierluigi Farnese, a natural son of Paul III., led to his retreat from Rome to Florence and Venice, and once more he was restored with greater honour than before. On returning from a visit to the court of Francis I., being now aged thirty-seven, he was imprisoned on a charge (apparently false) of having embezzled during the war the gems of the pontifical tiara; he remained some while confined in the castle of Sant' Angelo, escaped, was recaptured, and treated with great severity, and was in daily expectation of death on the scaffold. At last, however, he was released at the intercession of Pierluigi's wife, and more especially of the Cardinal d' Este of Ferrara, to whom he presented a splendid cup. For a while after this he worked at the court of Francis I. of Fontainebleau and in Paris; but he continued to devise figures to be set against him, and the intrigues of the king's favourites, whom he would not stoop to conciliate and could not venture to silence by the sword, as he had silenced his enemies in Rome, led him, after about five years of laborious and sumptuous work, and of continually-recurring jealousies and violations, to retire in 1545 in disgust to Florence, where he employed his time in works of art, and exasperated his temper in rivalries with the uneasy-natured sculptor Baccio Bandinelli. The first collision between the two had occurred several years before when Pope Clement VII. commissioned Cellini to mint his coinage. Now, in an altercation before Duke Cosimo, Bandinelli insultingly stigmatized Brvvenuto as guilty of gross immorality; in his autobiography Cellini rather repels than denies the charge, but he certainly repels it with demonstrative and grotesque vivacity. Two somewhat similar charges had been made ere this: one in Paris, which he braved out in court —the other, in Florence, was a mere private quarrel, and perhaps unworthy of attention. During the war with Siena Cellini was appointed to strengthen the defences of his native city, and, though rather shabbily treated by his ducal patrons, he continued to gain the admiration of his fellow-citizens by the magnificent works which he produced. He died in Florence in 1571, unmarried, and leaving no posterity, and was buried with great pomp in the church of the Annunziata. He had supported in Florence a widowed sister and her six daughters.

Besides the works in gold and silver which have been adverted to, Cellini executed several pieces of sculpture on a grander scale. The most distinguished of these is the bronze group of "Perseus holding the head of Medusa," a work (first suggested by Duke Cosimo de' Medici) now in the Loggia dei Lanzi at Florence, full of the fire of genius and the grandeur of a terrible beauty, one of the most typical and unforgettable monuments of the Italian Renaissance. In the midst of this greatest work gone Cellini the ubiquitous trouble-ridden pest; and its completion was hailed with rapturous homage from all parts of Italy. The original relief from the foot of the pedestal—Perseus and Andromeda—is in the Bargello, and replaced by a cast.

Not less characteristic of its splendidly gifted and barbarically untameable author are the autobiographical memoirs which he composed, beginning them in Florence in 1558,—a production of the utmost energy, directness and racy animation, setting forth one of the most singular careers in all the annals of fine art. His amours and hatreds, his passions and delights, his love of the sumptuous and the exquisite in art, his self-applause and self-assertion, running now and again into extravagances which it is impossible to credit, and difficult to set down as strictly conscious falsehoods, make this one of the most singular and fascinating books in existence. Here we read, not only of the strange and varied adventures of which we have presented a hasty sketch, but of the devout complacency with which Cellini could contemplate a satisfactorily achieved homicide; of the legion of devils which he and a conjurer evoked in the Colosseum, after one of his not innumerable mistresses had been spirited away from him by her mother; of the marvellous halo of light which he found surrounding his head at dawn and twilight after his Roman imprisonment, and his supernatural visions and angelic protection during that adversity; and of his being poisoned on two several occasions. If he is unmeasured in abusing some people, he is also unlimited in praising others. The autobiography has been translated into English by Thomas Roscoe, by J. A. Symonds, and by A. Macdonald. Cellini also wrote treatises on the goldsmith's art, on sculpture, and on design (translated by C. R. Ashbee, 1899).

Among his works of art not already mentioned, many of which have perished, were a colossal Mars for a fountain at Fontainebleau and the bronzes of the doorway, coins for the Papal and Florentine states, a Jupiter in silver of life size, and a bronze bust of Bindo Altoviti. The works of decorative art are, speaking broadly, rather florid than chastened in style.

In addition to the bronze statue of Perseus and the medallions already referred to, the works of art in existence to-day executed in the lifetime of the Italian sculptor and gem-cutter are these: a medallion of Clement VII. in commemoration of the peace between the Christian princes, 1530, with a bust of the pope on the reverse and a figure of Peace setting fire to a heap of arms in front of the temple of Janus, signed with the artist's name; a medal of Francis I. with his portrait, also signed; and a medal of Cardinal Pietro Bembo. Cellini, while employed at the papal mint at Rome during the papacy of Clement VII. and later of Paul III., executed the dies of several coins and medals, some of which still survive at this now defunct mint. He was also in the service of Alessandro de' Medici, first duke of Florence, for whom he executed in 1533 a forty-soldi piece with a bust of the duke on one side and standing figures of the saints Cosmo and Damian on the other. Some connoisseurs attribute to his hand several plaques, "Jupiter crushing the Giants," "Fight between Perseus and Phinaeus," a Dog, &c.

The important works which have perished include the uncompleted chalice intended for Clement VII.; a gold cover for a prayer-book as a gift from Pope Paul III. to Charles V.—both described at length in his autobiography; large silver statues of Jupiter, Vulcan and Mars, wrought for Francis I. during his sojourn in Paris; a bust of Julius Caesar; and a silver cup for the cardinal of Ferrara. The magnificent gold "button" or morsa, made by Cellini for the cope of Clement VII., the competition for which is so graphically described in his autobiography, appears to have been sacrificed by Pius VI., with many other priceless specimens of the goldsmith's art, in furnishing the indemnity of 30,000,000 francs demanded by Napoleon at the conclusion of the campaign against the States of the Church in 1797. According to the terms of the treaty, the pope was permitted to pay a third of that sum in plate and jewels. Fortunately there are in the print room of the British Museum three water-colour drawings of this splendid morsa by F. Bertoli, done at the instance of an Englishman named Talman in the first half of the 18th century. The obverse and reverse, as well as the rim, are drawn full size, and moreover the morsa with the precious stones set therein, including a diamond then considered the second largest in the world, is fully described.
BIBLIOGRAPHY.—The autobiography already named is the foundation of most of the works written concerning Cellulins's life. CELLULOSE, the name given to both an individual—cellulose proper, in the restricted sense of a chemical individual—and to a group of substances, the celluloses or cellulose group, which constitute in infinite varied forms the containing envelope of the plant cell. They are complex carbohydrates, or "saccharo-colloids" (Tollens), and are resolved by ultimate hydrolysis into monoses. The typical cellulose is represented by the empirical formula C₆H₁₀O₅, identical with that of starch, with which it has many chemical analogies as well as physiological correlations. The representative "cellulose" is the main constituent of the cotton fibre substance, and is obtainable by treating the raw fibre with boiling dilute alkalis, followed by chlorine gas or bromine water, or simply by alkaline oxidants. The cellulose thus purified is further treated with dilute acids, and then exhaustively with alcohol and ether. Chemical filter-paper (Swedish) is practically pure cellulose, the final purification consisting in exhaustive treatment with hydrofluoric acid to remove silicious inorganic residues. The "cellulose" group, however, comprises a series of substances which, while presenting the characters generally similar to those of cotton cellulose, also exhibit marked divergences. The resemblances are maintained in their synthetical reactions, but reactions involving the decomposition of the complex show many variations. For example, cotton cellulose is difficultly hydrolysed; other celluloses are more or less readily split up by dilute acids, the extreme members readily yielding sugars: the hexoses—dextrose, mannose and galactose; and the pentoses—xylose and arabinose; these less resistant cell-wall constituents are termed semi-celluloses.

The celluloses proper are essentially non-nitrogenous, though originating in the cell protoplasm. The cell-walls of the lower cryptogams, similarly purified, retain a notable proportion 2-0-4-0%-of constitutional nitrogen. When hydrolysed these fungoid celluloses yield, in addition to monoses, glucosamine and acetic acid. The celluloses of the phanerogams are generally associated, in a degree ranging from physical mixture to chemical union, with other complicated substances, constituting the "compound celluloses." The nature of the associated groups affords a convenient classification into pecto-celluloses, ligno-celluloses and cuto-celluloses. Pecto-celluloses are so named because the associated substances—carbohydrates, together with their oxidation products, i.e., containing either two carbonyls (CO) in the unit group or carboxyl (CO·OH) groups in a complex—are readily hydrolysed by weak acids to the gelatinous "pectic acids" or their salts. Ligno-celluloses are the substances of lignified tissue, the non-cellulose constituents of which are characterized by the presence of benzenoid and furfurail groups; and although essentially complex, they may be regarded as homogeneous, and are conveniently grouped under the name lignine. The ligno-cellulose complex reacts, by its unsaturated groups, with the halogens. It is a complex containing but little hydroxyl, and is of relatively high carbon percentage (55·0-57·0%). Cuto-celluloses predominate in the protective coatings of plant organs, and are characterized by constituent groups, the decomposition products of which are compounds of the fatty series, and also wax alcohols, acids, cholesterol, &c.

The typical pecto-cellulose is the flax fibre, i.e., the bast fibre of the plant Linum usitatissimum), as it occurs in the plant, or as the commercial textile fibre in its raw state. Rhea, or ramie, is another leading textile fibre in which the cellulose occurs associated with alkali-soluble colloidal carbohydrates. Pecto-celluloses are found in the stems of the Graminaceae (cereal straws, esparto), and in the fibro-vascular bundles of monocotyledons used as textile and rope-making fibres. They are the chief constituents of the fluffy parenchyma of fruits, tubers, rhizomes. Ligno-celluloses find their chemical representative in the jute fibre. They constitute the "woods," and are therefore of the widest distribution and the highest industrial utility. It is important to note that a complex having all the chemical characteristics of a ligno-cellulose occurs in a soluble colloidal form in the juice of the white currant. The formation of ligno-cellulose is the chemical equivalent of the morphological change of the plant cell known as "lignification." The typical cuto-celluloses are the epidermal tissues of all growing plants or organs, which are easily detached from the underlying tissues which it is their function to protect. To subservise this function, they are extremely resistant to the attack of reagents. The associated groups are mostly of the normal saturated series, and of very high molecular weight.

CELLULOSE AND BOTANICAL SCIENCE.—The elaboration of cellulose, i.e., of the cell walls, and its morphological and physiological aspects are discussed in the articles PLANTS: Physiology, Anatomy, and CYTOLOGY; while in the article COAL the part played by cellulose in the formation of these deposits receives treatment: here we may deal with its general relation to agriculture. In the analysis of fodder plants and other vegetable produce, the residue obtained after successive acid and alkaline hydrolysis is the "crude fibre" of the agricultural chemist, and is generally taken as a measure of the actual cellulose contents of the raw material. We give in tabular form the average percentage of crude fibre in typical food-stuffs and agricultural produce:

1 This percentage is calculated on air-dry-produce containing 15% of water.
The above figures have a purely empirical value, since they represent a complicated mixture of various residues derived from the celluloses and compound celluloses. This mixture may be further resolved, and by special quantitative methods the proportions of actual cellulose, ligno-cellulose and cuto-celluloses estimated (J. König, *Ber.*, 1906, 39, p. 3264). The figures are taken as an inverse measure of digestibility; at the same time it has been established that this group of relatively indigestible food constituents are more or less digestible and assimilable as flesh and fat producers. The percentage or coefficient of digestibility of the celluloses of the more important food-stuffs—green fodder, hay, straw and grains—varies from 20 to 75%. It has also been established that their physiological efficiency is, under certain conditions, quite equal to that of starch.

It must also be borne in mind that the indigestible food residues, as finally voided by the animal, have played an important mechanical part as an aid to digestion of those constituents more readily attacked in the digestive tract of animals. They are further an important factor of the agricultural cycle. Returned to the soil as "farm-yard manure," mixed with other cellulosic matter which has served as litter, they add "fibre" to the soil and, as a mechanical diluent of the mineral soil components, maintain this in a more open condition, penetrable by the atmospheric gases, and promoting distribution of moisture. Further by breaking down, with production of "humus," a complex of colloidal "unsaturated" bodies of acid function, they fulfil important chemical functions by interaction with the mineral soil constituents.

**Chemistry of Cellulose.**—Purified cotton cellulose, which is the definitive prototype of the cellulose group or series, is a complex of monosaccharids or their "residues." It is resolved by solution in sulphuric acid and subsequent hydrolysis of the esters thus produced into dextrose. This fundamental fact with its elementary composition, most simply expressed by the formula C₆H₁₂O₆, has caused it to be regarded as a polyanhydride of dextrose. Forming, as it does, simple esters in the ratio of the reacting hydroxyls 3OH: C₆H₁₂O₆, and taking into account its direct conversion into α-brom-methyl furfural (Fenton) a constitutional formula has been proposed by A. G. Green (Zeit. Farb. Textil Chem., 3, pp. 97 and 309 (1904)), which is a useful generalization of its reactions, and its ultimate relations to the simpler carbohydrates, viz.,

\[
\text{CH(OH)}-\text{CH(OH)} > O > O.
\]

Green considers, moreover, that a group thus formulated may consistently represent the actual dimensions of the reacting unit, but that unit of larger dimensions, if postulated, is easily derived from the above by oxygen linkages.

From another point of view the unit group has been formulated as CO

\[
\text{CH(OH)}-\text{CH(OH)} > \text{CH}_2
\]

the main linking of such units in the complex taking place as between their respective CO and CH₂ groups in the alternative enolic form CH-C(=O). This view gives expression to the genetic relations of the cellulosic to the ligno-cellulosics, to the tendency to carbon condensation as in the formation of coals, and pseudo-carbons, to the relative resistance of cellulosic to hydrolysis, and its other points of differentiation from starch, and more particularly to the ketonic character of its carbonyl (CO) groups, which is also more in harmony with the experimental facts established by Fenton as to the production of methyl furfural.

The probability, however, is that no simple molecular formula adequately represents the constitution of cellulose as it actually exists or indeed reacts. On the other hand, it has been suggested that cellulose is to be regarded as representing a condition of matter analogous to that of a saline electrolyte in solution, i.e. as a complex of molecular aggregates, and of residues (of monosaccharid groups) having distinct and opposite polarities; such a complex is essentially labile and its configuration will change progressively under reaction. The exposition of this view is the subject of a publication by Cross and Bevan (*Researches on Cellulose*, ii. 1906). The main purpose is to give full effect to the colloidal characteristics of cellulose and its derivatives, with reference to the modern theory of the colloidal state as involving a particular internal equilibrium of amphoteric electrolytes.

The typical cellulose is a white fibrous substance familiar to us in the various forms of bleached cotton. Other fibrous celluloses are equally characteristic as to form and appearance, e.g. bleached flax, hemp, ramie. It is hygroscopic, absorbing 6 to 7% of its weight from the air. When dry, it is an electrical insulator, and has a specific inductive capacity of about 7: when wetted it is a conductor, and manifests electrolytic phenomena. It is insoluble in water and in the ordinary solvents; it dissolves, however, in a 40-50% solution of zinc chloride, and in ammonical solutions of copper oxide (3% CuO, 15% NH₃): from these solutions it is obtained as a highly hydrated, gelatinous precipitate, from the former by dilution or addition of alcohol, from the latter by acidification; these solutions have important industrial application. Projected or drawn into a precipitating solution they may be solidified continuously to threads of various, but controlled dimensions: the regenerated cellulose, now amorphous, in its finer dimensions is known as cellulose silk or lustra-cellulose. These forms of cellulose retain the characteristic characters of the original fibrous and "natural" celluloses. In composition they differ somewhat by combination with water (of hydration), which they retain in the air-dry condition. They also further combine with an increased proportion of atmospheric moisture, viz. up to 10-11% of their weight.

**Derivatives.**—Important derivatives are the esters or ethereal salts of both inorganic and organic acids, cellulose behaving as an alcohol, the highest esters indicating that it reacts as a trihydric alcohol of the formula n[C₆H₄O₂(OH)]. The nitrates result from the action of concentrated nitric acid, either alone or in the presence of sulphuric acid: the normal nitrate represents a definite stage in the series of nitrates, and the ester at this point manifests the important property of solubility in various alcohols, notably ether-alcohol. Such nitrates are the basis of collodion, of artificial silk by the processes of Chardonnet and Lehner, and of celluloid or xylonite. Higher nitrates are also obtainable up to the limit of the trinitrate, which is insoluble in ether or alcohol, but is soluble in nitroglycerin, nitrobenzene and other solvents. These higher nitrates are the basis of the most important modern explosives.

Cellulose reacts directly with acetic anhydride to form low esters; in the presence of sulphuric acid the reaction proceeds to higher limits; the triacetate is soluble in chloroform. The acid sulphuric ester, C₆H₅O₂(SO₄H), is obtained by the action of sulphuric acid, but its relation to the original cellulose is doubtful. The monobenzoate and dibenzoate are formed by benzoyl chloride reacting on alkali-cellulose (see below). Cellulose xanthates are obtained from carbon bisulphide and alkali-cellulose; these are water soluble derivatives and the basis of "viscose," and of important industries. Mixed esters—acetosulphate, aceto-benzoate, nitrobenzoate nitrate, aceto-nitrosulphates—have also been investigated.

Cellulose (cotton), when treated with a 15-20% caustic soda solution, gives the compound C₆H₅O₂(OH)-2NaOH, alkali-cellulose, the original ribbon-like form with reticulated walls of the cellulose being transformed into a smooth-walled cylinder. The structural changes in the ultimate fibre determine the very considerable changes in the dimensions of fabrics so treated. The reactions and structural changes were investigated by J. Mercer, and are known generally as "mercerization." In recent years a very large industry in "mercerized" fabrics (cotton) has resulted from the observation that if the shrinkages of the yarns and fabrics be antagonized by mechanical means, a very high lustre is developed.

Similar, but less definite compounds, are formed with the oxides of lead, manganese, barium, iron, aluminium and chromium. These derivatives, which also find industrial applications in the dyeing and printing of fabrics, differ but little in

---

appearance from the original cellulose, and are without influence on its essential characteristics.

**Decompositions.**—Hydrolysis.—By solution in sulphuric acid, followed by dilution and boiling the diluted solution cellulose hydrolysates to fermentable sugars; this reaction is utilized industrially in the manufacture of glucose from rags. Hydrochloric acid produces a friable mass of "hydrocellulose," probably C₆H₄O₇, insoluble in water, but readily attacked by alkalis, with the production of soluble derivatives; some dextrin is formed in the original reaction. Hydrobromic acid in ethereal solution gives furfuran derivatives. Cold dilute acids have no perceptible action on cellulose. The actions of such acids are an important auxiliary to bleaching, dyeing and printing processes, but they require careful limitation in respect of concentration and temperature. Cellulose is extremely resistant to the action of dilute alkalis: a 1-2% solution of sodium hydrate having little action at temperatures up to 150°, hence the use of caustic soda, soda ash and sodium silicate in bleaching processes, *i.e.* for the elimination of the non-cellulose components of the raw fibre. Oxidation in acid solutions gives compounds classed as "oxycellulose," insoluble in water, but more or less soluble in alkalis; continued oxidation gives formic, acetic and carbonic acids. Oxidation in alkaline solution is more easily controlled and limited; solutions of bleaching powder, or more generally of alkaline hydrochlorites, receive industrial application in oxidizing the coloured impurities of the fibre, or residues left after more or less severe alkali treatments, leaving the cellulose practically unaffected. This, however, is obviously a question of conditions: this group of oxidants also oxidize to oxycellulose, and under more severe conditions to acid products, *e.g.* oxalic and carbonic acids. Certain bacteria also induce decompositions which are resolutions into ultimate products of the lowest molecular dimensions, as hydrogen, carbon dioxide, methane, acetic acid and butyric acid (Omeliansky) (Handb. Techn. Mykologie [F. Lafar] pp. 245-268), but generally the cellulose complex is extremely resistant to the organic ferments. Cellulose burns with a luminous flame to carbon dioxide and water; dry distillation gives a complicated mixture of gaseous and liquid products and a residue of charcoal or pseudo-carbon. Chromic acid in sulphuric acid solutions effects a complete oxidation, *i.e.* combustion to water and carbonic acid.

**Ligno-celluloses.**—These compounds have many of the characteristics of the cellulose esters; they are in effect ethereal compounds of cellulose and the quinonoid lignin complex, and the combination resists hydrolysis by weak alkalis or acids. The cellulose varies in amount from 80 to 90%, and the lignine varies inversely as the degree of lignification, that is, from the lignified bast fibre of annuals, of which jute is a type, to the dense tissues of the perennial dicotyledonous woods, typified by the beech. The empirical formula of the lignin complex varies from C₆H₅O₇ (jute) to C₆H₄O₇ (pine wood). In certain reactions the non-cellulose or lignine constituents are selectively converted into soluble derivatives, and may be separated as such from the cellulose which is left; for example, this gives products soluble in sodium sulphite solution, by the combination of unsaturated groups of the lignine with the halogen, while digestion with bisulphite solutions at elevated temperatures (140°-160°) gives soluble sulphonated derivatives. This last reaction is employed industrially in the preparation of cellulose for paper-making from coniferous woods. These reactions are "quantitative" since they depend upon well-defined constitutional features of the lignine complex, and the resolution of the ligno-cellulose takes place with no further change in the lignine than the synthetical combination with the substituting groups. The constituent groups of the lignine specifically reacting are of benzenoid type of the probable form

\[
\begin{align*}
\text{HC} & \quad \text{CO} \\
\text{H-C} & \quad \text{CO} \\
\text{C} & \quad \text{O} \\
\end{align*}
\]

deduced from the similarity of the chlorinated derivatives to mairgallol, the product of the action of chlorine on pyrogallol in acetic acid solution (A. Hantsch, *Ber.* 26, p. 2033).

The complex contains methoxyl (OCH₃) groups. There is also present a residue which is readily broken down by oxidizing agents, and indeed by simple hydrolysis, to acetic acid.

Another important group of actual constituents are pentoses—partially isolated as "wood gum" by solution in alkalis—and furfural derivatives (hydroxy furfurals) derived from these. The actual constitutional relationships of these main groups, as well as the localization of the methoxy groups, are still problematical.

Certain colour reactions are characteristic, though they are in some cases reactions of certain constituents invariably present in the natural forms of the ligno-cellulose; which may be removed without affecting the essential character of the lignine complex. Aniline salts generally give a yellow coloration, dimethyl-para-phenylenediamine gives a deep red coloration, phloroglucin in hydrochloric acid gives a crimson coloration. Reactions more definitely characteristic of the lignone are:—ferric ferrocyanide, which is taken up and transformed into Prussian blue throughout the fibre, without affecting its structure, although there may be as much as a 50% gain in weight; iodine in potassium iodide solution gives a deep brown colour due to absorption of the halogen, a reaction which admits of quantitative application, *i.e.* as a measure of the proportion of ligno-cellulose in a fibrous mixture; nitric acid gives a deep orange yellow coloration; digested with the dilute acid (5-10% HNO₃) at 50° the ligno-celluloses are entirely resolved, the lignone complex being attacked and dissolved in the form of nitroso-ketonic acids, which, on continued heating, are finally resolved to oxalic, acetic, formic and carbonic acids.

**Derivatives of Ligno-cellulose.**—By reaction with chlorine jute yields the derivative C₃H₅Cl₃O₆, soluble in alcohol, and in acetic acid; this derivative has the reactions of a quinone chloride. By reaction with sodium sulphite it is converted into a hydroquinone sulphonate of deep purple colour. The reaction of the ligno-celluloses (pine wood) with the bisulphites yields the soluble derivatives of the general formula C₅H₄O₇SO₃H (containing two OCH₃ groups). Jute reacts with nitric acid in presence of sulphuric acid to form nitrates; and with acetic anhydride to form low acetates. It reacts with alkaline hydrates with structural changes similar to those obtained with cotton; and by the further action of benzoyl chloride and of carbon bisulphide upon the resulting compounds there result the corresponding benzoates and xanthates respectively. But these synthetical derivatives are mixtures of cellulose and lignine derivatives, and so far of merely theoretical interest.

**Decompositions of Ligno-cellulose.**—In addition to the specific resolutions above described which depend upon the distinctive chemical characters of the cellulose and lignine respectively, the following may be noted: to simple hydrolytic agents the two groups are equally resistant, therefore by boiling with dilute acids or alkalis the groups are attacked pari passu. Weak oxidants may also be used as bleaching agents to remove coloured by-products without seriously attacking the ligno-cellulose, which is obtained in its bleached form. Nitric acid of all strengths may be used to complete the resolution. Chronic acid in dilute solutions combines with the lignone complex, but in presence of hydrolysing acids total oxidation of the lignone is determined. The principal products are oxalic, carbonic, formic and acetic acids. This reaction is an index of constitution. Generally, the lignone is attacked under many conditions and by many reagents which are without action upon cellulose, by virtue of its unsaturated constitution, and its acid and aldehydic residues.

**Cuto-cellulose.**—A typical cuto-cellulose is the cuticle (peel) of the apple which, when purified by repeated hydrolytic treatment and finally by alcohol and ether, gives a product of the composition C₅₇H₇₆O₇, H = 11.37%. 0 = 14.97%. Hydrolysis by strong alkalis gives stearo-cutic acid, C₂₈H₄₀O₄, and oleo-cutic acid, C₂₈H₄₀O₄ (Frémy). Cork is a complex mixture containing various compound celluloses: extraction with alcohol removes certain fatty alcohols and acids, and aromatic derivatives related to tannic acid; the residue is probably a mixture of cellulose, ligno-cellulose, cerin, C₂₈H₄₀O₄, and suberin; the latter yields

**CELLULOSE**
stearic acid, C₁₇H₃₁O₂, and the acid C₁₈H₃₂O₄. The cuticular celluloses have been only superficially investigated, and, with the exception of cork, are of but little direct industrial importance.

**Industrial Uses of Cellulose.—** The applications of cellulose to the necessities of human life, infinitely varied in kind as they are, are colossal in magnitude, depend upon two groups of qualities or properties, (1) structural, (2) chemical. The manufactures of vegetable textiles and of paper are based upon the fibrous forms of the naturally occurring celluloses, together with such structural qualities as are expressed in the terms strength, elasticity, specific gravity. As regards chemical properties, those which come into play are chiefly the negative quality of resistance to chemical change; this is obviously a primary factor of value in enabling fabrics to withstand wear and tear, contact with atmospheric oxygen and water, and such chemical treatments as laundring; positive chemical properties are brought into play in the auxiliary processes of dyeing, printing, and the treatment and preparation in connexion with these. Staple textiles of this group are cotton, flax, hemp and jute; other fibres are used in rope-making and brush-making industries. These subjects are treated in special articles under their own headings and in the article Fibres. The course of industrial development in the 19th century has been one of enormous expansion in use and considerable refinement in methods of preparation and manufacture. Efforts to introduce new forms of cellulose have had little result. Rhea or ramie has been a favourite subject of investigation; the industry has been introduced into England, and doubtless its development is only a question of time, as on the continent of Europe the production of rhea yarn is well established, though it is still only a relatively small trade—probably two or three tons a day total production. The paper trade has required to seek new sources of cellulose, in consequence of the enormous expansion of the uses of paper. Important phases of development were: (1) in the period of 1860 to 1870, the introduction of sparto, which has risen to a consumption of 250,000 tons a year in the United Kingdom, and which figure it remains fairly steady; (2) the decade 1850 to 1860, which saw the development of the manufacture of cellulose from coniferous woods, and this industry now furnishes a staple of world-wide consumption, though the industry is necessarily localized in countries where the coniferous woods are available in large quantities. As a development of the paper industry we must mention the manufacture of paper textiles, based upon the production of pulp yarns. Paper pulps are worked into flat strips, which are then rolled into cylindrical form, and by a final twisting process a yarn is produced sufficiently strong to be employed in weaving.

What we may call the special cellulose industries depend upon specific chemical properties of cellulose, partly intrinsic, partly belonging to the derivatives such as the esters. Thus the cellulose nitrates are the bases of our modern high explosives, as well as those now used for military purposes. Their use is steadily developed and perfected since the middle of the 19th century. The industries in celluloid, xylolite, &c., also depend upon the nitric esters of cellulose, and the plastic state which they assume when treated with solvent liquids, such as alcohol, anil acetate, camphor and other auxiliaries, in which state they can be readily moulded and fashioned at will. They have taken an important place as structural materials both in useful and artistic applications. The acetates of cellulose have recently been perfected, and are used in coating fine wires for electrical purposes, especially in instrument-making; this use depends upon their electrical properties of high insulation and low inductive capacity. Hydrated forms of cellulose, which result from treatment with various reagents, are the bases of the following industries: vegetable parchment results from the action of sulphuric acid upon cellulose (cotton) in the form of paper, followed by that of water, which precipitates the partially crystallized cellulose. This industry is carried out on "continuous " machinery, the cellulose, in the form of paper, being treated in rolls. Vulcanized fibre is produced by similar processes, as for instance by treating paper with zinc chloride solvents and cementing together a number of sheets when in the colloidal hydrated state; the goods are exhaustively washed to remove last traces of soluble electrolytes; this is necessary, as the product is used for electrical insulation. The solvent action of cupro-ammmonium is used in treating cellulose goods, cotton and paper, the action being allowed to proceed sufficiently to attack the constituent fibres and convert them into colloidal cupro-ammnonium compounds, which are then dried, producing a characteristic green-coloured finish of colloidal cellulose and rendering the goods impervious to water. The important industry of mercerization has been mentioned above; this is carried out on both yarns and cloth of cotton goods chiefly composed of Egyptian cottons. A high lustrous finish is produced, giving the goods very much the appearance of silk.

Of special importance are the more recent developments in the production of artificial fibres of all dimensions, by spinning or drawing the solutions of cellulose or derivatives. Three such processes are in course of evolution. (1) The first is based on the use of acetates of cellulose, which are dissolved in ether-alcohol, and spun through fine glass jets into air or water, the unit threads being afterwards twisted together to constitute the thread used for weaving (process of Chardonnet and Lehner). These processes were developed in the period 1883 to 1897, at which later date they had assumed serious industrial proportions. (2) The cupro-ammnonium solution of cellulose is similarly employed, the solution being spun or drawn into a strong acid bath which instantly generates cellulose hydrate in continuous length. (3) Still more recently the "viscose" solution of cellulose, i.e. of the cellulose xanthogenic acid, has been perfected for the production of artificial silk or hustra-cellulose; the alkaline solution of the cellulose derivative being drawn either into concentrated ammonium salt solutions or into acid baths. This product, known as artificial silk, prepared by the three competing processes, was in 1908 an established textile with a total production in Europe of about 3000 tons a year, a quantity which bids fair to be very largely increased by the advent of the viscose process, which will effect a very considerable lowering in the cost of production. The viscose solution of cellulose is also used for a number of industrial effects in connexion with paper-sizing, paper-coating, textile finishes, and the production of book cloth and leather cloth, and, solidified in solid masses, is used in preparing structural solids which can be moulded, turned and fashioned.

For the special literature of cellulose treated from the general point of view of this article, the reader may consult the following works by C. F. Cross and E. I. Bevan: Cellulose (2nd ed. 1903), Researches on Cellulose, i. (1901), Researches on Cellulose, ii. (1906).

**CELSIUS, ANDERS (1701-1744),** Swedish astronomer, was born at Upsala on the 27th of November 1701. He occupied the chair of astronomy in the university of his native town from 1730 to 1744, but travelled during 1732 and some subsequent years to Germany, Italy and France. At Nuremberg he published in 1733 a collection of 316 observations of the aurora borealis made by himself and others 1716-1732. In Paris he advocated the measurement of an arc of the meridian in Lapland, and took part, in 1736, in the expedition organized for the purpose by the French Academy. Six years later he described the centigrade thermometer in a paper read before the Swedish Academy of Sciences (see THERMOMETRY). His death occurred at Upsala on the 25th of April 1744. He wrote: *Novus Methodus consistere 5lomin solis a terra determinand (1730); De observationibus pro figura telluris determinand (1738); besides many less important works.*

See W. Ostwald's *Klassiker der exatn Wissenschaften,* No. 57 (Leyden, 1902). Anders Celcius's memoir on the thermometer is given in German with critical and biographical notes (p. 132); Marie, *Histoire des sciences,* viii. 30; Poggendorff's *Biog.-literarisches Handwörterbuch.*

**CELSIUS (c. A.D. 178),** a 2nd-century opponent of Christianity, known to us mainly through the reputation of his literary work, *The True Word* (or *Account; Ἀληθὴς Νόημα*), published by Origen in 248, seventy years after its composition. In that year, though the Church was under no direct threat of attack, owing
to the inertia of the emperor Philip the Arabian, the atmosphere was full of conflict. The empire was celebrating the 10th anniversary of its birth, and imperial aspirations and ideas were naturally prominent. Over against the state and the worship of the Caesar stood as usual the Christian ideal of a rule and a citizenship not of this world, to which a thousand years were but as a day. A supernatural pride was blended with a natural anxiety, and it was at this juncture that Origen brought to light again a book written in the days of Marcus Aurelius, which but for the great Alexandrian might have been lost for ever. Sometimes quoting, sometimes paraphrasing, sometimes merely referring, he reproduces and replies to all Celsus's arguments. His work shows many signs of haste, but he more than compensates for this by the way in which he thus preserves a singularly interesting memorial of the 2nd century. When we remember that only about one-tenth of the True Word is really lost and that about three-quarters of what we have is verbatim text, it would be ungracious to carp at the method.

Celsus opens the way for his own attack by rehearsing the taunts levelled at the Christians by the Jews. The book was written in Alexandria, and nurtured on the wisdom of Egypt. His assertion of divine dignity is disproved by his poverty and his miserable end. Christians have no standing in the Old Testament prophecies, nor is it any prophecy that has revealed to some of their own adherents is foolishness. Celsus indeed says that the Jews are almost as ridiculous as the foe they attack; the latter said the saviour from Heaven had come, the former that his own Messiah was on the horizon. However, the Jews have won the advantage of being an ancient nation with an ancient faith. The idea of an Incarnation of God is absurd; why should the human race think itself so superior to beasts, ants and elephants as to be put in the same category? Why should we yield to its magic in coming to men as a Jew? The Christian idea of a special providence is nonsense, an insult to the deity. Christians are like a council of frogs in a marsh; or a syndog of worms on a dunghill, croaking and squeaking. It was the fable of the world created, and more reasonable to believe that each was the handiwork of a special deity; prophets and supernatural messengers had forsooth appeared in more places than one. Besides being bad philosophy based on fictitious history, Christianity is not respectable. Celsus does not indeed repeat the Thessalonian charge, so frequent, against Christians by their calumniators, but he says the Christian teachers are mainly weavers and cobbler's with no power over men of education. The qualifications for conversion are ignorance and childishness, and upon the excesses of the ignorant and undisciplined "prophets" who roam through cities and camps and decorate everlasting fire cities and lands and their inhabitants. Above all Christians are disloyal, and every church is an illicit collegium, an insurrection, a rebellion at all times, but especially so under Marcus Aurelius. Why charge Christians with charges which they themselves so philosophic and political authority of the world? A properly understood worship of gods and demons is quite compatible with a purified monotheism, and they might as well give up the mad idea that they should be worshipped under a thousand names, to the Father, Son and Holy Spirit, in the hope of attaining anything like universal agreement on divine things.

The philosophy of Celsus. and Porphyry (q.v.) are the two early literary opponents of Christianity who have most claim to consideration, and it is worth noticing that, while they agree alike in high aims, in skilful address and in devoted toil, their religious standpoints are widely dissimilar. Porphyry is above all a pure philosopher, but also a man of deep religious feeling, whose quest and goal are the knowledge of God; Celsus, the friend of Lucian, though sometimes called Epicurean and sometimes Platonist, is not a profound philosopher at all, but a man of the world, really at heart an agnostic, like Caeccilius in Minucius Felix (q.v.), whose religion is nothing more or less than the Empire. He is keen, positive, logical, combining with curious dashes of scepticism many genuine moral convictions and a good knowledge of the various national religions and mythologies whose relative value he is able to appreciate. His manner of thought is under the overpowering influence of the eclectic Platonism of the time, and not of the doctrine of the Epicurean school. He is a man of the world, of philosophic culture, who accepts much of the influential Platonism of the time but has absorbed little of its positive religious sentiment. In his antipathy to Christianity, which appears to him barbaric and superstitious, he gives himself up to the scepticism and satire of a man of the world through which he comes in contact with Epicurean tendencies." He quotes approvingly from the Timaeus of Plato: "It is a hard thing to find out the Maker and Father of this universe, and after having found him it is impossible to make him known to all." Philosophy can at best impart to the fit some notion of him which the elect soul must itself develop. The Christian on the contrary maintained that God is known to us as far as need be in Christ, and He is accessible to all. Another sharp antithesis was the problem of evil. Celsus thought evil constant in amount as being the correlative of matter. Hence his scorn of the theory of the resurrection of the body held then in a very crude form, and his ridicule of the attempt to raise the vulgar masses from their degradation. The real root of the difficulty to Platonist as to Gnostic was his sharp antithesis of form as good and matter as evil.

Opinion at one time inclined to the view that the True Word was written in Rome, but the evidence (wholly internal) points much more decisively to an Egyptian, and in particular an Alexandrian origin. Not only do the many intimate references to Egyptian history and customs support this position, but it is clear that the Jews of Celsus are not Western or Roman Jews, but belong to the Orient, and especially to that circle of Judaism which had received and assimilated the idea of the Logos.

The date also is clearly defined. Besides the general indication that the Empire was passing through a military crisis, which points to the long struggle waged by Marcus Aurelius against the Marcomanni and other Germanic tribes, there is a reference (Contra Celsum, viii. 60) to the rescript of that emperor impressing on governors and magistrates the duty of keeping a strict watch on extravagances in religion. This edict was declared by Justin (vii. 177) and inaugurated the persecution which lasted from that time till the death of Marcus Aurelius in 180. During these years Commodus was associated with Marcus in the empire, and Celsus has a reference to this joint rule (viii. 71).

Celsus shows himself familiar with the story of Jewish origins, and any pagan who wished to understand and criticize Christianity intimately had to begin by learning from the Jews, Value in the history of Christianity and this accounts for the opening chapters of his argument. He has a good knowledge of Genesis and Exodus, refers to the stories of Jonah, Daniel (vii. 53) and Enoch (v. 52), but does not make much use of the Prophets or the Psalter. As regards the New Testament his position is closely in agreement with that reflected in the contemporary Acts of the Martyrs of Scilii. He speaks of a Christian collection of writings, and knew and used the gospels, but was influenced less by the fourth than by the Synoptics. There is more evidence of Platonist ideas than of Pauline letters.

The gnostic sects and their writings were well known to him (viii. 15 and v. 25), and so was the work of Marcion. There are indications, too, of an acquaintance with Justin Martyr and the Sibylline literature (vii. 53, cp. v. 61). "He is perfectly aware of the internal differences between Christians, and he is familiar with the various stages of development in the history of their religion. These are clearly employed in order to heighten the impression of its instability. He plays off the sects against the Catholic Church, the primitive age against the present, Christ against the apostles, the various revisions of the Bible against the trustworthiness of the text and so forth, though he admits that everything was not really so bad at first as it is at present." The True Word had very little influence either on the mutual
relations of Church and State, or on classical literature. Echoes of it are found in Tertullian and in Minucius Felix, and then it lay forgotten until Origen gave it new life. A good deal of the neo-Platonic polemic naturally went back to Celsus, and both the ideas and phrases of the True Word are found in Porphyry and Julian, though the closing of the New Testament canon in the meantime somewhat changed the method of attack for these writers.

Of more importance than these matters is the light which the book sheds on the strength of the Church about the year 180. It is of course easy to see that Celsus had no apprehension of the spiritual needs even of his own day which it was the Christian purpose to satisfy, that he could not grasp anything of the new life enjoyed by the poor in spirit, and that he underrated the significance of the Church, regarding it simply as one of a number of warring sects (mostly Gnostic), and so seeing only a mark of weakness. And yet, there is all through an undercurrent which runs hard against his surface verdicts, and here and there comes to expression. He is bound to admit that Christianity has been stated reasonably; against the moral teaching of Jesus he can only bring the lame charge of plagiarism, and with the Christian assertion that the Logos is the Son of God he completely accords. Most suggestive, however, is his closing appeal to the Christians. "Come," he says, "do not hold aloof from the common régime. Take your place by the emperor's side. Don't claim for yourselves another empire, or any special position." It is an overture for peace. "If all were to follow your example and abstain from politics, the affairs of the world would fall into the hands of wild and lawless barbarians" (viii. 68). Forced to admit that Christians are not "infractossi in negotiis," he wants them to be good citizens, to retain their own belief but conform to the state religion. It is an earnest and striking appeal on behalf of the Empire, which was clearly in great danger, and it shows the terms offered to the Church, as well as the strength of the Church at the time. Numerically, Christians may have formed perhaps a tenth of the population, i.e. in Alexandria there would be fifty or sixty thousand, but their power in a community was out of all proportion to their mere numbers.

LITERATURE.—Th. Keim, Celsus' Wahres Wort (1874); Pelagaud, Étude sur Celse (1876); K. J. Neumann's edition in SCRIPTORES GREECI qui Christianam impugnaverunt religionem, and article in HAUCK-HERZOG'S Realencyc. für prot. Theol., where a very full bibliography is given. See also W. Moeller, Hist. of the Chr. Church, i. 169 ff.; A. Harnack, Expansion of Christianity, ii. 129 ff.; J. A. Frazer, The Study of the Teutonic Races, pp. 1-19.

CELT, or KELT, the generic name of an ancient people, the bulk of whom inhabited the central and western parts of Europe. (For the sense of a primitive stone tool, see the separate article, later.) Much confusion has arisen from the inaccurate use of the terms "Celt" and "Celtic." It is the practice to speak of the dark-complexioned people of France, Great Britain and Ireland as "black Celts," although the ancient writers never applied the term "Celt" to any dark-complexioned person. To them great stature, fair hair, and blue or grey eyes were the characteristics of the Celt. The philologists have added to the confusion by classing as "Celtic" the speeches of the dark-complexioned races of the west of Scotland and the west of Ireland. But, though usage has made it convenient in this work to employ the term "Celtic" cannot be properly applied to what is really "Gaelic.

The ancient writers regarded as homogeneous all the fair-haired peoples dwelling north of the Alps, the Greeks terming them all Keltoi. Physically they fall into two loosely-divided groups, which shade off into each other. The first of these is restricted to north-western Europe, having its chief seat in Scandinavia. It is distinguished by a long head, a long face, a narrow aquiline nose, blue eyes, very light hair and great stature. Those are the peoples usually termed Teutonic by modern writers. The other group is marked by a round head, a broad face, a nose often rather broad and heavy, hazel-grey eyes, light chestnut hair; they are thick-set and of medium height. This race is often termed "Celtic" or "Alpine" from the fact of its occurrence all along the great mountain chain from south-west France, in Savoy, in Switzerland, the Po valley and Tirol, as well as in Auvergne, Brittany, Normandy, Burgundy, the Ardennes and the Vosges. It thus stands mid-way not only geographically but also in physical features between the "Teutonic" type of Scandinavian and the so-called "Mediterranean race" with its long head, long face, its rather broad nose, dark brown or black hair, dark eyes, and slender form of medium height. The "Alpine race" is commonly supposed to be Mongoloid in origin and to have come from Asia, the home of round-skulled races. But it is far more probable that they are the same in origin as the dark race south of them and the tall fair race north of them, and that the broadness of their skulls is simply due to their having been long domiciled in mountainous regions. Thus the "Celtic" or (Bos longifrons), from remote ages the common type in the Alpine regions, is characterized by the height of its forehead above the orbits, by its highly-developed occipital region, and its small horns. Not only do animals change their physical characteristics in new environment, but modern peoples when settled in new surroundings for even one or two centuries, e.g. the American of New England and the Boer of South Africa, prove that man is less readily affected by his surroundings.

The northern race has ever kept pressing down on the broad-skulled, brown-complexioned men of the Alps, and intermixing with them, and at times has swept right over the great mountain chain into the tempting regions of the south, producing such races as the Celtico-Ligyes, Celtiberians, Celtilyrians, Celto-Thracians and Celto-Scythians. In its turn the Alpine race has pressed down upon their darker and less warlike kindred of the south, either driven down before the tall sons of the north or swelling the hosts of the latter as they swept down south. As the natives of the southern peninsula came into contact with these mixed people, who though differing in the shape of the skull nevertheless varied little from each other in speech and colour of their hair and eyes, the ancient writers termed them all "Keltoi." But as the most dreaded of these Celtic tribes came down from the shores of the Baltic and Northern Ocean, the ancients applied the name Celt to those peoples who are spoken of as Teutonic in modern parlance. The Teutons, whose name is generic for Germans, appear in history along with the Cimbri, universally held to be Celts, but coming from the same region as the Guttones (Goths) by the shores of the Baltic and North Sea. Again, the Germani themselves first appear in the Celtic host destroyed by Marcellus at Clastidium in 225 B.C. All the true Celsae or Galates in France had come across the Rhine; the British tribes in northern France were Cemari, who also had crossed the Rhine: in Caesar's day the Germans were still constantly crossing that river, and so-called Gauls who lived near the Germans, e.g. the Treveri, closely resembled the latter in their habits, while in later times were to come Goths and Franks from beyond the great river. It is then not strange that the Gallic name for a benchman (ambactus) is the same as the Gothic (ambachts). The earliest invaders, under the name of Celtae, had occupied all central Gaul, doubtless mixing with the aboriginal Ligurians and Iberians, who, however, maintained themselves respectively in the later Provence and in Aquitania. The Celts had firmly established themselves by the 7th century B.C. and we know not how long before, the Bituriges (whose name survives in Berry) being the dominant tribe. In the Alps and the Danube valley some of the Celts had dwelt from the Stone Age; there they had developed the working of copper, discovered bronze (an alloy of copper and tin), and the art of smelting iron (see Hallstatt).

The Umbrians, who were part of the Alpine Celts, had been pressing down into Italy from the Bronze Age, though checked completely by the rise of the Etruscan power in the 10th century B.C. The invention of iron weapons made the Celts henceforth irresistible. One of the earliest movements after this discovery was probably that of the Achaean of Homer, who about 1450 B.C. invaded Greece (see Achaeans), bringing with them the use of iron and brooches, the practice of cremating the dead, and the style of ornament known as Geometric. Later the Cimmerians (see Scythia and Cimmeria) passed down from the
Cimbric Chersonese, doubtless following the amber routes, and then turned east along the Danube, some of their tribes, e.g. the Treres, settling in Thrace, and crossing into Asia; others settled in southern Russia, leaving their name in the Crimean; then when hard pressed by the Scythians most of them passed round the east end of the Euxine into Asia Minor, probably being the people known as Gimiri on Assyrian monuments, and ravaged that region, the relics of the race finally settling at Sinope.

At the beginning of the 6th century B.C. the Celts of France had grown very powerful under the Biturigian king Ambigatus. They appear to have spread southwards into Spain, occupying most of that country as far south as Gades (Cadiz), some tribes, e.g. Turdentic and Turduli, forming permanent settlements and being still powerful there in Roman times; and in northern central Spain, from the mixture of Celts with the native Iberians, the population henceforward was called Celtiberian. About this time also took place a great invasion of Italy; Segovius and Bellovius, the nephews of Ambigatus, led armies through Switzerland, and over the Brenner, and by the Maritime Alps, respectively (Livy v. 34). The tribes who sent some of their numbers to invade Italy and settle there were the Bituriges, Arverni, Senones, Aedu, Ambardi, and Aluerci.

Certain material remains found in north Italy. The at Sesto Calende may belong to this invasion. The next great wave of Celts recorded was that which swept down on north Italy shortly before 400 B.C. These invaders broke up in a few years the Etruscan power, and even occupied Rome herself after the disaster on the Allia (390 B.C.). Bought off by gold they withdrew from Rome, but they continued to hold a great part of northern Italy, extending as far south as Sena Gallica (Sine-galgia), and henceforward they were a standing source of danger to Rome, especially in the Samnite Wars, until at last they were either subdued or expelled, e.g. the Boi from the plains of the Po. At the same time as the invasion of Italy they had made fresh descents into the Danube valley and the upper Balkan, and perhaps may have pushed into southern Russia, but at this time they never made their way into Greece, though the Athenian ladies copied the style of hair and dress of the Cimbric women. About 280 B.C. the Celts gathered a great host at the head of the Adriatic, and accompanied by the Ilyrian tribe of Aeutaricæ, they overthrew the Macedonians, overran Thessaly, and invaded Phocis in order to sack Delphi, but they were finally repulsed, chiefly by the efforts of the Aetolians (270 B.C.). The remnant of those who returned from Greece joined that part of the tribes which had remained in Thrace, and marched for the Hellespont. Here some of their number settled near Byzantium, having conquered the native Thracians, and made Tyle their capital. The Byzantines had to pay them a yearly tribute of 80 talents, until on the death of the Gallic king Cavaurus (some time after 220 B.C.) they were annihilated by the Thracians. The main body of the Gauls who had marched to the Hellespont crossed it under the leadership of Leonnicius and Lutarius. Straightway they overran the greater part of Asia Minor, and laid under tribute all west of Taurus, even the Seleucid kings. At last Attila, king of Pergamum, defeated them in a series of battles commemorated on the Pergamene sculptures, and henceforth they were confined to a strip of land in the interior of Asia Minor, the Galatia of history. Their three tribes—Trocli, Tolistobogians and Tectosages—submitted to Rome (180 B.C.), but they remained autonomous till the death of their king Amynias, when Augustus erected Galatia into a province. Their descendents were probably the “foolish Galatians” to whom St Paul wrote (see Galatii).

Ancient writers spoke of all these Gauls as Cimbræ, and identified them with the Cimmerians of earlier date, who in Hомерic times dwelt on the ocean next to the Laestrygones, in a region of wintry gloom, but where the sun set not in summer. Nor was it only towards the south and the Hellespont that the Celtic tide ever set. They passed eastward to the Danube mouth and into southern Russia, as far as the Sea of Azov, mingling with the Scythians, as is proved by the name Celto-scyths. Mitthraic dates VI. of Pontus seems to have negotiated with them to gain their aid against Rome, and Bititius, a Gallic mercenary, was with him at his death.

The Celts had continually moved westwards also. The Belgæ, who were Cimbric in origin, had spread across the Rhine and given their name to all northern France and Belgium (Galitia Belgica). Many of these tribes sent colonies over into southwestern Britain, where they had been masters for some two centuries when Caesar invaded the island (see Britain). But there is evidence that from the Bronze Age there had been settlers in northern Britain who were broad-skulled and cremated their dead, a practice which had arisen in south Germany in the early Bronze Age or still earlier. It is not unlikely that, as tradition states, there were incursions of Celts from central Gaul into Ireland during the general Celtic unrest in the 6th century B.C. It is certain that at a later period invaders from the continent, bringing with them the later Iron Age culture, commonly called La Tène, which had succeeded that of Hallstatt, had settled in Ireland. Not only are relics of La Tène culture found in Ireland, but the oldest Irish epics celebrate tall, fair-haired, grey-eyed heroes, armed and clad in Gallic fashion, who had come from the continent. The Celts in Italy, in the Balkan, in France and in Britain overspread the Indo-European peoples, who differed from themselves but slightly in speech. The Celts represented Indo-European q by ð, whilst the Greeks, Illyrians, Thracians, Ligurians, and aborigines of France, Britain and Ireland represented it by s, c or qu. The Umbric-Sabellian tribes had the same phonetic peculiarity as the Celts. Thus Gallic petor (petor-ritum,”four-wheeler”), Umbric petor, Homeric πισάπες, Boecottian (Achaean) τετραπές, Welsh pedwar; but Gaelic cethir, Lat. quattuor. The Celts are thus clearly distinguished from the Gaulic-speaking dark race of Britain and Ireland, and in spite of usage it must be understood that it is strictly wrong to apply the term Celtic to the latter language.

Celtic Languages

Introduction.—The Celtic languages form one group of the Indo-European family of languages. As might be expected from their geographical distribution, they hold a position between the Italic and Teutonic groups. They are distinguished from these and other branches of the family by certain well-marked characteristics, the most notable of which are the loss of initial and inter-vocalic h, cf. Ir. ashar with Lat. petor; ir. lén, “full,” Welsh llawn, Breton leun, with Lat. plenus; Gaulish are, “beside,” Ir. or, Welsh, Breton or, with Gr. παρά, παθά; and the change of I. ë to ë, cf. Ir. ìr, “true,” Welsh gwir, Breton gwir, Lat. verus. We may further mention that the I. E. labialized velar ë is represented by b, e.g. Ir. bb, “cow,” Welsh buch, Gr. βοῦς, Sanskr. āus; Ir. bén, “woman,” Gr. γυνή, whilst the medial aspirates bh, dh, gh result in simple voiced stops. I. E. sonant r and l become r, l. Other distinctive features of the modern dialects are not found in Gaulish, partly owing to the character of the monuments. Such are the -ss-preterite and the fusion of simple prepositions with pronominal elements, e.g. Ir. fri-umm, “against me,” Welsh wrth-yf, Breton oua-inn. The initial mutations which are so characteristic of the living languages did not arise until after the Romans had left Britain. The Celtic languages betray a surprising affinity with the Italic dialects. Indeed, these two groups seem to stand in a much closer relationship to one another than any other pair. As features common to both Celtic and Italic we may mention: (1) the gen. sing. ending -i of masc. and neut. stems in o; (2) verbal stems in -sion; (3) the -e future; (4) the passive formation in -r.

The various Celtic dialects may be divided as follows:—(1) Gaulish; (2) Goidelic, including Irish, Scottish Gaelic, and Manx; (3) Brythonic, including Welsh, Breton and Cornish. Gaulish and Brythonic, like Oscan and Umbrian among the Italic dialects, change the I. E. labialized velar guttural ë to ð, whilst the Goidelic dialects retain the ë which later gives up the labial...
element and becomes *k*, e.g. Gaulish *pete-*, "four," Ir. *cethir*; Welsh *peigr*, Breton *petar*, Lat. *quattuor*; Ir. *sa*, "who?" Welsh *wch*, Breton *vetr*, Lat. *equus*. Several attempts have been made to prove the existence of Celtic dialects with *g* on the continent. Forms containing *g* occur in the Coligny calendar, discovered in 1897, by the side of others with *q*, a state of affairs not yet satisfactorily accounted for. The Rom tablets, discovered in 1898, have not been interpreted as yet, but *p* forms are found on them exclusively. In an excursus we shall deal with the language of the Picts.

No comprehensive handbook of the Celtic languages on the lines of Grüber's *Grundriss der romanischen Philologie* or Paul's *Grundriss der germanischen Philologie* has so far been written. One should refer to Windisch's article "Keltische Sprachen" in Ersch and Gruber's *Allgemeine Encyclopädie der Wissenschaften und Künste*, and V. Tourneur, *Esquisse d'une histoire des études celtiques* (Lège, 1905; vol. ii, with full bibliography). Also H. Zimmer, in *Die Kultur des Gegenwart*., T. i. Abh. xi. 1, Berlin and Leipzig, 1909. The materials for the study of the older forms of the languages are to be found in Zeuss's *Grammatica Celtica* as revised by Ebel. A comparative grammar of the Celtic dialects has been prepared by H. Pedersen (Göttingen, 1908). See also Whitley Stokes and A. Bezenberger, *Wortschatz der keltischen Sprachheit* (Göttingen, 1894).

I. GAULISH.—Celtic place-names are found as far east as the Dniester and Dobrudja, and as far north as Westphalia. The language of the Galatians in Asia Minor must have stood in a very close relation to Gaulish. Indeed few traces of dialectical differences are to be observed in continental Celtic. Unfortunately no literary monuments written in the ancient speech of Gaul have come down to us, though Caesar makes mention of religious and military ceremonies transmitted by oral tradition, and we also hear of *borts* and *vaes*. But a large number of personal and place-names have been preserved. The classical writers have, moreover, recorded a certain number of Gaulish words which can generally be identified without difficulty by comparing them with words still living in the modern dialects, *e.g.* *pempedu*; "cinquefoil," cf. Welsh *pemp*; "five," and *deilen*; "leaf"; *ambactus*, Welsh *oma*; *petterium*, "four-wheeled chariot," cf. Welsh *pedwar*, "four," and Ir. *roth*, "wheel," or *rit*, "course." We have further between thirty and forty inscriptions (three in north Italy) which we may without hesitation ascribe to the Gauls. These inscriptions are written in either N. Etruscan or Greek or Latin characters. We are thus in a position to reconstruct much of the old system of descent, which resembles Latin very closely on the one hand, and on the other represents the forms which are postulated by the O. Ir. paradigms. Hence Gaulish is particularly valuable as preserving the final vowels which have disappeared in early Irish and Welsh. The few verb-forms which occur in the remains of Gaulish are quite obscure and have not been admitted of a satisfactory explanation. The statements of ancient authors with regard to the language are conflicting, but there cannot be much doubt that the language of the latter was substantially the same as Gaulish. Caesar observes that there was little difference between the speech of the Gauls and the Britons in his day, and we may regard Gaulish as closely akin to the ancestor of the Brythonic dialects. It is difficult to say when Gaulish finally became extinct. It disappeared very rapidly in the south of France, but lingered on, possibly till the 6th century, in the northern districts, and it seems unnecessary to discredit Jerome's statement that the speech of the Galatians in Asia Minor bore a strong resemblance to the language he had heard spoken in the neighbourhood of Trier. There is no evidence that Breton has been influenced by continental Celtic.

The number of Gaulish words which have come down in the Romance languages is remarkably small, and though at first sight the sound-changes of French and Welsh seem to bear a strong likeness to one another, any influence of Gaulish on Breton is slight. French is largely discounted when we find the same changes occurring in other dialects where there is little or no question of Celtic influence.

The proper names occurring in classical writers, on inscriptions and coins, have been collected by A. Holder in his monumental *Alteitalischer Sprachschatz* (Leipzig, 1869-1908). The inscriptions have been most recently treated by J. Rhys in the *Proceedings of the British Academy*, vol. ii. See also a paper in this volume entitled "Celtic and Galla" by the same author for the text of the Coligny and Rom inscriptions. The value of Gaulish for grammatical purposes is set forth by Whitley Stokes in a paper on "Celtic Declension" in the *Proceedings of the London Philosophical Society* (1885-1886).

For the extent over which Gaulish was spoken, its relation to Latin and its influence on Romance, see E. Windisch's article on "Keltische Sprache" in the section *Die vorromannischen Volks sprachen* in *Grube's Grundriss der germanischen Philologie*; vol. i. pp. 373 ff. Further the introduction to J. Loth's *Chrestomathie bretonne* (Paris, 1890); G. Dottin, *Manuel pour servir à l'étude des antiquités celtiques* (Paris, 1906); R. Thurneysen, *Keltoromanisches* (Halle, 1884).

II. GOIDELIC AND BRITTONIC.—When the monuments of the Celtic dialects of the British Islands begin to appear, we find a wide divergence between the two groups. We can only mention some of the more important changes. The Brythonic dialects have gone very much farther in giving up inflectional elements into the Goidelic. In Irish all final syllables in general disappear except long vowels followed by *or* and *u* preceded by *i*. But these reservations do not hold good for Brythonic. Thus, whilst O. Irish possesses five cases the Brythonic dialects have only one, and they have further lost the neuter gender and the dual number in substantives. In phonology there are also very striking differences, apart from the treatment of the labialized velar *q* already mentioned. The sonant *n* appears in Brythonic as *an*, whereas in Goidelic the nasal disappears before *k*, with compensatory lengthening of the vowel, e.g. I. E. *q*mion, Ir. *c*elt, "hundred," W. *c*ant, Bre. *kant*; Prim. Celt. *jovysko-*, Ir. *oc*, Mod. Ir. *eg*, "young," W. *s*enac, Bre. *sioand*. *i, k* standing after a vowel and preceding *l, n* (and also *r* if *k* precede) disappear in Goidelic with compensatory lengthening of the vowel, e.g. Prim. Celt. *sidls*, Ir. *sida*, "heel," W. *s*addu; Prim. Celt. *petrion*, Ir. *brn*, "bird," O. W. *bim*, Mod. W. *bim*. Similarly *b, d* disappear in Goidelic when standing after a vowel and preceding *r, n*; *l* disappears demonstratively in Brythonic, but in Welsh they produce a vowel forming a diphthong with the preceding vowel, e.g. Prim. Celt. *nhelb*, Ir. *nfl*, "cloud," W. *niw*; Prim. Celt. *ugne-*, cf. Lat. *agnus*, Ir. *an*, "lamb," from *b*n, W. *on*; Prim. Celt. *sgea-, cf. Ger. *Wagen*, Ir. *f*n, "wagon," O. W. *guein*, Mod. W. *guvin*. The Goidelic dialects have preserved the vowels of accented syllables on the whole better than Brythonic. Thus Brythonic has changed Prim. Celt. *d* ( = I. E. *d* to) *t* (O. W. *tr*, Bre. *trei*); and Prim. Celt. *a* to *i*, e.g. Ir. *brthir*, "brother," W. *brwed*, Bre. *breu*. Gaelic dánun, Ir. *dun*, "fort," W. *duin*. Already in Gaulish the I. E. diphthongs show a tendency to become simple long vowels and the latter are treated differently by Goidelic and Brythonic. In early times I. E. *eu* os both became *o* and I. E. *ai* gave *e*. In Goidelic *e*, in accented syllables were diphthongized in the early part of the 8th century to *ao, ia* if the next syllable did not contain the vowels or *e* or *i*, whereas in Brythonic *a* gave *u* (written *u* and *e* became in W. *u* (wy), and in Bre. *r* (wee), e.g. Gaulish *Teuto-, Touilus*, Ir. *itth*, "people* W., Bre. *tuw*; Brythonic *Ltx to-, Ir. liath, "grey," W. *llu*, Bre. *lwned*. Similarly in loan-words, Ir. *cér, ful*, W. *culw*, O. Corn. *gul*, from Lat. *celi*, *velum*. Further I. E. *ai* os are preserved in Irish as *ai* (oei), *ai* (o), Mod. Ir. *ao*, but in Welsh I. E. *ai* gave either *ai* or *oe*, whilst *oi* changed to *U* (written *u*), Ir. *toeh*, "side* W., Bre. *tue*; I. E. *oinos*, Ir. *en*, "one," W. *bre*, Prim. Celt. *saillo-, cf. Lat. *sacculum*, W. *hoel*, "age," Bre. *hoel*. In Goidelic accented *e* changes to *i* before *i, a* in the following syllable, cf. Ir. *i*, "wood," gen. sing. fede, O. H. G. *weiu*, and *i* changes to *e* before *a* or *o* under similar conditions. In like manner *u* becomes *o* before *a* or *o*, whilst *o* changes to *u* before *i, u*, cf. Ir. *muir*, "sea," Prim. Celt. *mori, gen. sing. mora*. Of Brythonic words which disappear, *i, (0), j* alone influence preceding vowels, whilst an *i* (y) which received the stress in O. W. was also able to modify vowels which went before it. In Goidelic the combinations *a-o* appear respectively as *s, s* (medially), but in Brythonic they both give *chu*; Prim. Celt. *squeol, Ir. sol*, "story," W. *chweol*; Prim. Celt. *sisor, Ir. shur, "sister," but *mo shur*, "my sister" (whence Scottish *piolaid* by false de-aspiration), W. *chuester, Bre. *chiora*.)
Brythonic initial s becomes h in the 7th century, but this is not the case in Goidelic, e.g. Ir. salam, “salt,” W. halen, Cornish hale, Breton holen; Lat. sēmen, Ir. slí, “seed.” W. hulân. Initial v gives i in Goidelic in the course of the 7th century, whereas in Brythonic it appears as gu, gw, cf. Lat. vērus, Ir. fēr, W. gwir. We may also note that in Goidelic initial j and medial û disappear, e.g. Gaulish jovincillus, W. iawnac, “young,” Breton jowânc, ûac, ûac, W. bywdu, “food,” Ir. biad. Post-consonantal j in Brythonic sometimes gives -i (Mod. W. -iêd, Mod. Bre. -êj), e.g. Gaulish nesioi, nonioi, O. Bre. nowi, W. nowyd, Bre. neus, Ir. nuc. I. E. -kt and -pt both appear in Goidelic as -cht but in Brythonic as -ith, cf. Lat. septem, O. Ir. secht, W. seith, Bret. seis.

For the unfortunate we know very little about the position of the stress in ancient Gaulish. According to Meyer-Lübke in place-names the penult was accented if the vowel was long, otherwise the stress lay on the preceding syllable, e.g. Augustolănum, O. Fr. Oastum, now Autun; Catalăunos (Châlons), Tricasses (Fr. Troyes), Biturigés (Fr. Bourges). In Goidelic the stress, which is strongly migratory, is always placed on the first syllable except in certain cases in verbs compounded with prepositional prefixes. In Old Welsh and Old Breton, on the other hand, the final syllable, i.e. the primitive penult, received stress in cases in which the stress was in the middle period to the penultimate. The Goidelic dialects, like the Slavonic, distinguish between palatalized and non-palatalized consonants, accented as the consonant was originally followed by a front (a, i) or back vowel (e, o, u), a phenomenon which is entirely unique to Brythonic.

Finally, the two groups differ radically in the matter of initial mutation or, as it is often called, aspiration. These mutations are by no means confined to initial consonants, as precisely the same changes have taken place under similar conditions in the interior of words. The Goidelic changes included under this head probably took place for the most part between the 5th and 7th centuries, whilst in Brythonic the process seems to have begun and continued later. It is easier to fix the date of the changes in Brythonic than in Goidelic, as a number of British names are preserved in lives of saints, and it is possible to draw conclusions from the shape that British place-names assumed in the mouths of the Anglo-Saxons. In Goidelic, we find two mutations, the vocalic and the nasal. Initial mutation only takes place between two words which belong together syntactically, and is contained in one single stress-group, thus between article, numeral, possessive pronoun or preposition, and a following substantive; between a verbal prefix and the verb itself.

1. When the word causing mutation ended in a vowel we get the vocalic mutation, called by Irish grammarians aspiration. The sounds affected are the tenues k (c), t, p; the mediae g, d, b; the liquids and nasals m, n, r, l; s; and Prim. Celt. r (Ir. f, w gw). At the present day the results of this mutation in Irish and Welsh may be tabulated as follows. Where the sound is at variance with the traditional orthography, the latter is given in brackets. In the case

<table>

</table>

of n, r, l in Goidelic we get a different variety of n, r, l sound. In the case of n, r, l, the absolute initial is a voiceless r, l written rh, ll, which on mutation become voiced and are written r, l. In Irish becomes h written sh and the mutation of f is written fh, which, however, is now silent. Examples—Irish, ca, “host,” do, “you,” dhu, “he,” dhuill, “he will,” dubh, “black,” dhuine, “a person”; Welsh, dyw, “he will,” dywnt, “he has,” Pr. Celt., *tvu; Irish midheir, “mother,” an midheir, “the mother,” Welsh mam, “mother.”

When the word causing mutation ended in a nasal, we get the nasal mutation called by Irish grammarians etc. The sounds affected are k (c), t, p; g, d, b; Prim. Celt. r (Ir. f, w gw). In mod. Irish and mod. Welsh the results are tabulated below. Irish f becomes w written wh, whilst W. gw gives nwe.

2. When the word causing mutation ended in a nasal, we get the nasal mutation called by Irish grammarians etc. The sounds affected are k (c), t, p; g, d, b; Prim. Celt. r (Ir. f, w gw). In mod. Irish and mod. Welsh the results are tabulated below. Irish f becomes w written wh, whilst W. gw gives nwe.

causing mutation originally ended in s. There is nothing corresponding to this consonantal mutation in Goidelic. In this case k (c), t, p become the spirants x (ch), k, f (sh), e.g. bod, “father,” el thod, “her father,” el, represents a primitive *esíos. In the interior of words in Brythonic, cc, pp, ll give the same result as initial k, t, p by this mutation.

The relation in which the other Celtic dialects stand to this system will be mentioned below in dealing with the various languages. It will be noted from what has been said above that, with the exception of the different treatment of the labialized velar qe, and the nasal sonant g, the features which differentiate the Brythonic from the Goidelic dialects first appear for the most part after the Romans had left Britain. At the beginning of the Christian era the difference between the two groups can only have been very slight. At that stage and Wales, that the Roman and Old Welsh agreed in a very striking manner in the use of the verbal particle ro and in other syntactical peculiarities connected with the verb.

(l.) Goidelic.—The term Goidelic is used to embrace the Celtic dialects of Ireland, Scotland, and the Isle of Man. In each case the national name for the speech is Gaelic (Ir. Gaedhilg, Scottish Gàidhlig, Manx Gaile), from Ir. Scottish Gaodhal, Gaidel, Mid. Ir. Goeld, W. Gwyddel, “a Gael, inhabitant of Ireland or Scotland.” Old Irish may be regarded as the ancestor of Scottish and Manx Gaelic, as the forms of these dialects can be traced back to Old Irish, and there are practically no monuments of Scottish and Manx in the oldest period. Scottish and Irish may be regarded as standing to one another much in the same relation as broad Scottish and southern English. The divergences of Scottish and Manx from Irish will be mentioned below. The language of the Ogam inscriptions is the oldest form of Goidelic with which we are acquainted. Some 300 inscriptions have been found in this alphabet, the majority of them hailing from the south-west of Ireland (Kerry and Cork). In Scotland 32 are known, whilst in England and Wales about 20. Most of the latter are in South Wales, but one occurs in Wales, and one has occurred as far east as Hampshire. The Isle of Man also possesses two. The letters in the oldest inscriptions are formed by strokes or notches scored on either side of the edge of an upright stone. Thus we obtain the following alphabet—

This system, which was eked out with other signs, would seem to have been framed in the south-west of Ireland by a person or persons who were familiar with the Latin alphabet. Some of the inscriptions probably go back to the 5th century and may be earlier. As illustrations of the simplest forms of Ogam inscriptions we may mention the following: Doveto macq Cattinn, i.e. “(the stone) of Doveto son of Cattinn”; Trenaquisiu Macq Mqí-Treni is rendered in Latin Trenequisus Fili Macreni hic jactis; Sagarmi Macq Cunatam, “(the stone) of Sagarmus son of Cunatamus”; Ovanos avo Ivactass, “(the stone) of Ovanus descendant of Ivactuss.” It will be seen that in the oldest of these inscriptions q is still kept apart from k (c), and that the final syllables have not disappeared (cf. macqi, O. Ir. maic, but it appears certain that in Ogam writing stereotyped forms were used long after they had disappeared in ordinary speech. Several stones contain bilingual inscriptions, but the key to the Ogam alphabet is supplied by a treatise on Ogam writing contained in the Book of Ballymote, a manuscript of the late 14th century. It should be mentioned that the Welsh
stones are early whilst the Scottish ones are almost without exception late, and several of the latter have so far defied interpretation. In addition to the Irish Ogam there are a number of Christian inscriptions in Latin character, but, with one exception, they are not older than the 8th century.

See R. K. Brash, The Ogam Inscribed Monuments of the Gaedhil (London, 1879); R. A. Stewart Macalister, Studies in Irish Epigraphy (London, vol. i. 1897, vol. ii. 1902, vol. iii. 1907. The Welsh inscriptions, which is in the case of many of them fall almost exclusively to the case of Rhiys (London, 1879). The Scottish stones have also been treated by Rhys in the Proceedings of the Scottish Society of Antiquaries (Edinburgh, 1892). See also G. M. Atkinson for the tract in the Book of Ballymote, a Manuscript of Archæology (1874). The Irish Christian inscriptions were published by Margaret Stokes as the annual volumes of the Roy. Hist. and Archæol. Association of Ireland (1870-1877), and have been republished by R. A. Stewart Macalister.

(a) Irish.—We are able to trace the history of the Irish language continuously for a period of 1400 years, and from the time that the literary documents begin we are better supplied with materials for investigating the case with any other Celtic dialect. At the same time that form of Irish which is to be found in the oldest documents has preserved a number of features which have entirely, or almost entirely, disappeared from the Brythonic languages. For this reason scholars have largely occupied themselves with Irish, which for purposes of comparative philology may be regarded as the classic Celtic language.

The history of Irish is divided into three periods.—Old Irish (700-1100), the documents mainly representing the language of the tribes Eri, Midh, and Nori, which lived from 1100 to 1550; Modern Irish from 1550 to the present day. These periods merge into one another to such an extent that no firm division can be made. The language of some manuscripts of the 12th century contains elements of a language which is more modern in feeling. Early Old Irish or Irish Eri, the language of the documents was partly employed by historians and antiquarians in the middle of the 17th century. Old Irish, as compared with Brythonic, preserves a wealth of inflectional forms in declension and conjugation, but also a certain amount of the inflectional alternation of a non-palatalized dialect with palatalized forms. The famous rule of the grammarians known as case le coe lagus leathan an leathan ("slower to slender and broad to broad"), but it is not so strictly adhered to in the spoken language as is commonly stated. In the older language the quality of medial and final consonants varies, and the distinction is imperfectly kept in modern Irish, in part, and in some cases considerably. The consonants are regularly not denoted as such, e.g. O. and Mid. Ir. fr, Mod. Ir. fior. In Old and Mid. Irish the initial mutations are only regularly denoted in the case of the vocalic mutation of c, p, t, s, f, and the corresponding mutation of b, d, g. The vocalic mutation of c, p, t, s, f, was denoted by writing ch, ph, th, fh, sc, fc, the first three symbols of which were derived from the Latin alphabet. Another method of denoting the mutation was to write a dot over the letter, originally the pronunciation of the dot being shown by the vertical stroke. Hence we have do-bóir, "he gives," by the side of ni tábair, "he does not give," infin. tabairt; do-gnú, "I do," ni díonim, "I do not do," infin. díonim. The changes caused by this alternation in addition to the working of the accent and to the initial and internal mutations have played havoc with the former system and rendered it exceedingly difficult to reconstruct the paradigms. In the later periods of the language analogy naturally plays a great part, and many of the complicated forms are done away with, but even today there remain in the language a number of secondary tions forms still survives in the commonest verbs, e.g. Irish bhíeir sé, "he gives," ni thabhair sé, "he does not give," infin. tabhairt; Scottish bhíeir e, cha toirt, toirt; Manx ver eh, cha der, coey; Irish ni do-bóir, "he does not give," infin. díonim, Scottish ni e, "he does," cha deam e, "he will not do," infin. deamaim; Manx nee eh, cha foon eh, fannoo.

In the early period Irish borrowed a number of words from Latin. This was mainly connected with the etymology of words of civilization which would be imported from Roman Britain. Some of these show traces of British pronunciation, e.g. O. Ir. tríndóttl, from Latin trinitatem with for d. In others again, Lat. p is represented by the i.e., which may be due to the mutation of i.e, which was the nearest Irish sound to the foreign p. Thus we find Ir. corcu, "purple," case, Easter; cencigies, "Whitsunday;" crimmther, "presbyter. In addition to these several loans were received from Norse—Irish trum, Mid. Irish trime, Alt. Irish trime, which came in, and during the middle and modern periods the number of English words introduced is legion. Pedersen has tried to show in his Vergl. Gramm. that a considerable number of words were borrowed from English (Welsh) at an early date.

For the Celtic language in Vendryes, De hibernicae vocabulis qua a latina lingua originem duxerunt (Paris, 1902). Kuno Meyer has collected a number of loan-words from Norse, Anglo-Saxon, Early English, Latin and Early French in Revue Celtique, 1900, 1903, 1905 and has traced the subsequent development of these words in Irish. In 1897 Stokes, Revue Celtique, iii. 186 ff., and W. A. Craigie, Zeitfhr. f. celt. Phil. i. 439 ff.

With regard to the dialects of Irish, there is a well-known rhyme which dates from the 14th century, and which says: "One danger great is death, but the other greater dangers are in the mouth of man, and dialectical differences must have existed at an early period, though they do not make their appearance in the literary language until the 18th century. At the present day the Irish of Leinster and Munster are spoken more commonly in the rural parts of the country, whilst in the cities and towns of Munster the dialect of Cork is the most common. But in the other three provinces the vernacular still lives, and we find the Irish of Munster, Connaught and Ulster marked off from one another by well-defined peculiarities. In general it may be said that Munster is more conservative than the north. In Munster there is a tendency to shift the word-stress from the initial syllable to a heavy derivative syllable, e.g. ãn. This does not
not take place in Connaught, whilst in Ulster the tendency is to shorten the vowel. Again in monosyllables ending in /l/, /n/, /m/, and under certain other conditions a short vowel becomes a diphthong in the south, in Connaught it is merely lengthened, but in Ulster the short /e/ of the final syllable is retained (Connaught /bíll/, Munster /báil/). Final /gh/ in Munster are sounded as /基督徒/. In certain cases the north prefers the vocalic mutation which the west and south have the nasal, thus notably in the dative singular of prepositions. After consonants the nasal is dropped in the west and retained in the east, but this is a fact that the influence of O’Connell and his satellites, and above all that of the Roman Catholic clergy, was against the language. In spite of the efforts of the Gaelic League (founded 1893), which have with considerable success reduced the length of the language, the Irish are chiefly confined to the following counties, where over 20% of the population speak Gaelic: Waterford, Cork, Kerry, Clare, Galway, Mayo, Sligo, Donegal. The following figures will illustrate the decay of the language, and the fall of speakers:

According to the report published in 1893 by E. O’Donovan, the number of speakers had fallen to 200,000.

The work of the earlier compilers of glosses will be mentioned in the literature section below. The first dictionary of the modern language of any importance was that published by J. O’Brien in 1762. The same E. O’Donovan published a dictionary (Dublin, 1817). This book contains a vast store of words gathered on no principle whatever from all manner of sources, and has therefore to be used with caution, but even at the present day it renders considerable assistance and is still one of the most important works on the Irish Language.

The first efforts of the Gaelic League to publish a dictionary were made in 1884, but the latter’s death in 1904. The first trustworthy dictionary of the modern language was published under the auspices of the Irish Texts Society by P. J. Dinneen (London, 1904). English-Irish dictionaries have been published by D. Douglas (Dublin, 1855); E. E. Fournier (Dublin, 1903); T. O’Neill Lane (Dublin, 1904).

(5) Scottish Gaelic.—Scottish Gaelic is the form of Gothic speech which was introduced into Scotland by the Dalriadic Scots who came over from Ireland in the early centuries of our era. We possess practically no early monuments of the language. We have one or two inscriptions in Latin characters, such as that at St Vigeans and the Ogam mentioned above, which have not yet been solved. In the Book of Deir there is a colophon of a few lines probably written by an Irish scribe in the 8th century, and as the language of these lines differs in no wise from the Irish of the period, we do not know if they accurately represent the Gaelic of Scotland or if they may not be pure Irish. In the same MS. there are further Gaelic scraps belonging to the 11th and 12th centuries. The word-forms in these entries are identical with those current at the time in Ireland, but the historical orthography seems to show more signs of decay than is the case in Irish. The medieval Scottish MSS. in the Advocates’ Library at Edinburgh are only just being published, but they seem to have been used to hail from Ireland or to be written in pure Irish. The end of the 15th century brought a change. The Lordship of the Isles, the great bond between Ireland and Scotland, was broken up.

The Gaels of Scotland, thrown on their own resources, advanced their own dialect to the position of a literary language and tried to discard the Irish orthography. The Book of the Dean of Lismore, compiled about 1500, is written in a kind of phonetic orthography which has not as yet been sufficiently investigated. The language of those poems which are not directly ascribed to Irish poets, and which may therefore be regarded as representing the literary language of the Highlands at the time, seems to occupy a position midway between Irish and Scottish Gael. But until the beginning of the 18th century the Highlands were
under the literary dominion of Ireland, so much so that Bedell's Irish version of the Scriptures was circulated in Scotland with a glossary from 1600 to 1673, and Bishop Carsewell's version of the Knox’s Prayer-book (1567) is in Gaelic. The literary portion of the people is poorly preserved in the 16th and 17th centuries, and the vocabulary is not fixed until we reach the 18th century.

Irish and Scottish Gaelic differ considerably in point of vocabulary, but there are also important divergences in phonetics and inflections. In the first place, Scottish Gaelic as written has entirely given up the nasal mutation (eclipse), e.g. Scottish ar br, “our cow,” whereas Irish has ar bhr, “our cow.” Hence, the distinction between palatalized and non-palatalized consonants is not so rigidly observed in Irish as in Scottish. It should, however, be observed that in the Outer Isles the nasal mutation has been partly restored, and in some places there are even parallels to the Welsh nasal mutation of c, p, t to ngh, nh, rh, etc. In the pronunciation of the nasal sounds, the nasalized sound not represented in writing, thus mac “son,” is pronounced mabhk; slat, “rod,” as slat. Again there is a tendency to insert a shiht in the group rf, thus ceart, “right,” is sounded ksrth, and the distinction between palatalized and non-palatalized consonants is not so clearly observed in Irish. The group chf is in Scotland pronounced as cckh. We may also mention that Scottish Gaelic preserves an old ɨ in a number of words where Irish now has a, thus, Old Ir. ger, Scottish G. fér, “our cow,” but in both cases the spelling is fe, as in German wohnen, “to live.”

In the conjugation the synthetic forms have with one or two exceptions entirely disappeared and the present forms have become monosyllabic. Hence in ordinary grammar books Scottish Gaelic is little more than a future, its present form is the pretéritum. A future, “I shall do.” The past participle chiefly ends in -đe as against Irish -the, -te, or -tha, -ta, according to the quality of the preceding sound. The present (future) and past subjunctive (conditional) represent the two forms in which the language of the Irish is preserved. It approaches more nearly to Irish and preserves the inflections much better than the speech of the north.

The following characteristics of the northern dialect of Scottish Gaelic may be noted:

1. The diphthong is not so pronounced in the north than in the south. (2) The vowel o in the north is more regularly the high-back-narrow-unrounded vowel sound, whereas the south in many cases has a low-front-wide-round sound.

2. The north has str in initial position where the south has s or h, Furtwängler, “there is a dropping of unaccented final vowels. It may be remarked that in the reduction of derivative endings containing long vowels Scottish goes hand-in-hand with Ulster Irish, thus Connaught arán, “bread,” is in Ulster and Scottish Gaelic arán, “bread,” whereas Ulster Irish has a number of synthetic verb-forms and in using as negative cha, Mid. Ir. nico, nocha.

But, on the other hand, Scotland, with the exception of South Argyll and some of the Isles, diphthongizes a, o, e, in monosyllables in a very distinct manner. Further, Nairn on the Moray Firth and Inverness, and the Invernesshire districts of Ross and Caithness, do not have the same.

(c) Monax.—Our sources of information with regard to the language of the Isle of Man are even more scanty in the early period than they are in the case of Scotland. There are a number of references to Manx during the middle ages, and the use of the vernacular we possess is the version of the Book of Common Prayer made by Bishop Phillips in 1610. In this translation the traditional Irish orthography is not followed. The spelling resembles the orthography which was employed in Scotland by the compiler of the Book of the Dean of Lismore. How far this system was used is a question which it is difficult to decide. In Scotland the Irish orthography has prevailed in a slightly modified form, but Manx writers adhered to a mode of spelling which was as phonetic as any system based on English, or, probably more correctly Anglo-Scottish, orthography could be. This fact, combined with the rapid phonetic decay of the
language, makes it extremely difficult to discover what sound-values are to be attached to the various symbols. At the beginning of the 19th century, English was not understood by two-thirds of the natives, and in 1764 the S.P.C.K. issued a paper containing this statement: 'The population of the Isle is, of whom the far greater number are ignorant of English.' But from this time English gradually crept in. The last edition of the Manx Bible was issued in 1819, and of the New Testament in 1840. The present writer's great-grandmother refused to speak English, his grandfather (b. 1815) preached in Manx and English, and his father (b. 1844) only spoke English. The following figures illustrate the rapid decline of the language:—

Monolinguists. Bilinguists.

1875 190 (out of a population of 6,084 exclusive of Douglas)

1901 None 4,419

Manx stands in a much closer relation to Scottish Gaelic than Irish, and fishermen state that they could understand a good deal of what is said in South Argyll, though they are quite at a loss at Kinsale. Manx exhibits the same tendency as Scottish to use analytical and periphrastic forms in the verb, thus English 'to do,' is used like Scottish deinn ish with an infinitive to express the past and the future. The present has acquired a momentary (future) signification, and the past participle ends in -th (Scottish -th). The negative is cha as in Scotland and English, whereas Irish an doth. Irish uses dropping-stressed final vowels, e.g. chaim, "lord," Irish, aine ish, -yn is the favourite plural ending in substantives. The nasal mutation has been partly given up. Old Irish stressed e is frequently retained, e.g. fan, "man," Irish far (spelt fear), and two unstressed e's are retained in Irish, e.g. kin, "foot," Scottish, Irish cos. Manx is divided in itself about the treatment of short accented vowels before l, m, n, r. According to Rhys the south side lengths, whilst the north side diphthongizes; e.g. Irish crann, "tree," clann, "offspring," e.g. kroun, "brown," kroun, "krown (written croan, cloan)." In the matter of stress Manx is quite different, going farther even than the dialects of the south of Ireland. Not only does it shift the stress in the case of heavy derivative suffixes like -do and reduce the preceding vowel, e.g. Ir. farain, Sc. fuaran, Manx frân, "spring," but even in cases like cleghda, "variety," Sc. cr. clogheadh, O. Ir. crommchord, corda, "voice," Ir. corre, "voice." The Mid. English stress on the final is further retained in words from the French such as ashkin, "nation," loryw, "deli," kroun, "krown (written croan, cloan)." As other features peculiar to Manx we may mention the following. An intervocalic s or sh shows a tendency to become hisped and voiced. In monosyllables post-vocalic final m, n, r, are often aspirated as in English, e.g. Reer, "near," maam, "may," mbr, "mbr," may be heard as bedm. Ir. ã becomes more palatal and is often om. Ir. se becomes ã, sht, e.g. Ir. fseor, "evening," Manx fastur; Ir. wisce, "water," Manx asheir.

AUTOMATISM OF MANX.—The place and personal names of the Isle of Man have been collected by A. W. Moore in Manx Names 1 (London, 1903) (33% of the proper names are Scandinavian). The chief source of information about the spoken language is J. Rhys, The Outlines of the Phonology of Manx Gaelic (London, 1895) (the book has unfortunately no index and no tests). The only serious attempt to represent spoken Manx graphically is the transcription of a song by J. Strachan in the Zeitschr. für Celtische Philologie, vol. i. p. 54. The native grammarian is J. Kelly, who in 1803 published A Practical Grammar of the Ancient Gaelic or Language of the Isle of Man, usually called Manks. This book was republished by W. Gill for the Manx Society in 1859, and a facsimile reprint of this latter was made for Quaritch, London, 1870. A first dictionary was published by the Rev. J. Kelly, a useful little book entitled First Dictionary of the Manx Language, by the Rev. J. Kelly (London, 1901). There are two dictionaries, one by A. Cregen, Douglas 1835, which is now being republished for An Cheasghaite Galiegach, a Douglas society which is encouraging the use of Manx, with a life of the Rev. J. Kelly by the Rev. J. Kelly (2 vols. with an index, London, 1886). The other is by J. Kelly in two parts—(1) Manx and English, (2) English and Manx, published by the Manx Society in 1856. Kelly also prepared a Triglot of Manx, Irish and Gaelic, based upon English, which has never been published. A useful paper on the language appeared in the London Magazine, vol. xii. p. 37. Some of the linguistic communications of the late H. Jenner, "The Manx Language: Its Grammar, Literature and Present State." (E. C. Q.)

(ii). Brythonic. The term Brythonic is used to denote the Celtic dialects of Wales, Brittany and Cornwall. Unlike the Coidels the Brythonic peoples have no common name for their language. Forms of Brythonic speech were doubtless current throughout England and Wales and the Lowlands of Scotland at the time of the Saxon invasion. The S.E. of Britain may have been extensively Romanized, and it is not impossible that remnants of Goidelic speech may have lingered on in out-of-the-way corners. No literary documents dating from this period have been preserved, but some idea of the character of Brythonic speech may be gained from the numerous inscriptions which have come to light. In the middle of the 6th century the Manx language was confined to the western half of Britain south of the Clyde and Forth. The colonization of Britannia minor or Armoric Brittanly during the 5th and 6th centuries will be described later. In the latter part of the 6th century the W. Saxons pushed their conquests as far as the estuary of the Severn, and from that time the Brythons of S.W. Britain were cut off from their kinsmen in Wales. Early in the 7th century the Brythons of Strathclyde were similarly isolated by the battle of Chester (613). The kingdom of Strathclyde maintained a separate existence until the 10th century, and it is generally stated that Brythonic speech did not die out there until the 12th century. The question as to how far Brythonic names and words have survived in these districts has never been properly investigated. Certain it is that Brythonic numerals survived amongst shepherds in Cumberland. Westmorland and N.W. Yorkshire down to the second half of the 19th century, just as hernias are still counted in Manx by Manx fishermen otherwise quite innocent of the language. Accordingly, from the 7th century onwards Brythonic became gradually limited in Great Britain to three districts—Strathclyde, Wales, and Cornubia. The last stronghold of the Brythons of Wales and Strathclyde often form side by side by the Manx, Angles, and it is from this period that the name by which the Welsh call themselves is supposed to date, Cymro < "Combro, pl. Cymry < "Combrus, i.e. "fellow-countrymen" as opposed to W. Oldfro, Gaul. Aldobrog, "foreigners." We have no means of determining when Celtic speech became extinct in the petty states of the north which retained their independence longest.

The chief features which distinguish the Brythonic from the Goidelic dialects have already been enumerated. In the course of the 6th and 7th centuries short final vowels disappeared. In compound names the final vowel remains in the first component until the 7th century. Short vowels in other than initial syllables when immediately preceding the stress (on the historical penultimate) disappear, whilst long ones are shortened, e.g. Welsh cardui from Lat. cardui. Other vowels in unstressed position are apt to be reduced, thus ã, ã; give ã in W. (Mid. W. y). A marked characteristic of Welsh as distinguished from Cornubia and Brittany is the treatment of ã as the stress of influence. In W. ã is ã, in Cornubia and Breton o, e.g. Welsh veint, "saints," Breton. sent, sing. sent. The mutations seem to have started in the second half of the 5th century in the case of the tenues.

(a) Welsh (Cymraeg).—It is usual to divide the history of the Welsh language into three periods—Old, Middle and Modern. To the oldest period belong the collections of glosses, the earliest of which go back to about 800. The middle period extends from 1100 to 1500.

As a rule the medial mutation of the tenues and mediae is not denoted in O. Welsh. Intervocalic ã is sometimes retained but generally assimilated when it has disappeared in other positions. In the course of the 9th century initial w (ã) becomes ã (later gw). As the O. Welsh documents consist almost entirely of isolated words, we know scarcely anything about the morphology of the language during this period. To the middle period belong the ã of ã, ã. ã as borrowed from the Black Book of Carmarthens, but the language of these compositions is evidently much older than the date of the manuscript (12th century), as it preserves a number of very archaic features. Other borrowed sounds which are typical of the O. Welsh Laws contained in a MS. of the 12th century. To a somewhat later date belong the Mabinogion (14th century MS.), and the prose versions of French romances published by R. Williams (15th century). Welsh tenues has been lost in writing, though not consistently, and from this period dates the introduction of ã and ã (O. W. ã, ã) to denote vowel sounds. The symbol ã to denote a voiceless ã was already employed in Mid. W. ã, ã = voiceless ã, ã = voiceless ã. The symbol ã does not appear or only become regular during the modern period. In Mod. W. the orthography is regularized and does not differ
materially from that of the late medieval documents. In O.W. the old stress on the final syllable (the historical penult) appears to have been preserved, but during the middle period the accent was shifted to the penult. In consequence of this change of stress (see above under "Languages") the English verb "to be" in Mod. W., e.g. Mid. W. pechalt <Lat. peccatum, Mod. W. pechod.

The comparative wealth of inflection preserved by O. W. has almost entirely disappeared in Welsh. There are only the faintest traces of the present and the preterite penultimate in Mod. W., e.g. Mid. W. pechalt <Lat. peccatum, Mod. W. pechod.

Chinese

The Irish nominal declension according to -o (<-o), -a (<-a), -e (<-e), -i (<-i), -u (<-u), palatal, and -is (<-is), dactylal, and nasal stems, Welsh only distinguishes the nom. sing. and plur., the latter sometimes retaining an old formation. Thus masculine nouns show palatal modification, e.g. band, "horn," but feminine nouns may show either the palatal (pant, "milk") or the dactylal (pynd, "beads").

The termination -ones of the -s-stems appears as -an. The inflection of nominal objects between a verbal particle and the verb itself is largely determined by the presence or absence of a personal pronoun, in the pres. ind. there are instances in the oldest Welsh of the peculiar alternation between orthotonic and absolutes which characterize the Irish paradigms, e.g. peir, "it endures," and eir.<br/>

The several types of conjugation represented in Irish have become obscured, traces remaining only in the endings of the third sing. of the present ind., the pret. ind. (Mid. W. -as, -es, -is) and the pret. passive (Mid. W. -ai, -et, -ii). The verb system of Welsh comprises the following tenses: indic. pres. (also used as future), imperative, imperfect, praeterite (in Mid. W. forms with s have become prevalent as in Irish, but forms corresponding to the Irish preterites in it or with reduplication or unreduplicated with long vowels are present in the form of the present), and the present.</br>

In the subj. early W. distinguishes pres. and past, but the latter comes to be replaced by the plural perfective. The sign of the subj. is -h(<-h), which reminds one of the Irish s-subj., though the formation is somewhat different. There is no sign of a future formation containing 3-s. (See also under WELSH.)

We have seen already that Welsh began to exist as a separate entity roughly at the end of the 6th and beginning of the 7th century. In the latter half of the 7th century the language was confined in pretty much their present limits by Offa, king of Mercia, who constructed the Dyke going by his name, which has approximately remained the political boundary of Wales up to the present day. Onwards the bitter feeling against England which we find expressed in the fervid compositions of Iolo Goch and other political bards served to prevent any serious inroads of English on Welsh-speaking territory. From the 10th to the 13th century the influence of the English language appears in the poems of Lewis Glyn Cothi and others. And the striking difference in the manner in which the Reformation was regarded in Ireland and Wales is worthy of remark. During the Stuart wars the Welsh nobles fought on the side of the English, and the name of William Parri, who was at the instigation of Wales becoming thoroughly Anglicized both in sentiment and language. At the same time the practice of the Tudors was reversed in many particulars. Thus it became the custom to appoint Englishmen for the bishops of a king and for the archbishops of St. David's, in the latter part of the 16th century and the 17th century and the 18th century. In this manner it is not a matter for surprise that a feeling of estrangement should grow up between the bulk of the population, who only knew Welsh, and the clergy and nobles, their intellectual leaders. The neglect of Welsh is also shown in the fact that the English words which have even crept into such classical works as Prichard's Cymrolyw y Cymry and Ellis Wyn's Gweledigaethau y Bardd Cwsg. It is stated that, of the 269 works published by Welshmen between 1532 and 1644, only 39 were written in Welsh, and of these only 41 in Welsh, and of these 37 consist of works of piety. Thus at the beginning of the 18th century there seemed a fair chance that Welsh would soon become extinct like Cornish.

And yet, in the face of a considerable number of the Methodists in Wales. The preachers, in order to get hold of the masses, addressed them in the vernacular, and their efforts were crowned with enormous success. At the same time a minister of the English Church, Griffith Jones, was preaching in Latin schools to which young and old might come to learn to read the Bible. Between 1737 and 1760 3,385 such schools sprang up, at which no fewer than 156,235 persons of all ages learned to read their native language. After Griffith Jones death this work was carried on by his successors, notably by Charles of Bala (1755-1814), who passed over to Calvinistic Methodist and whose schools were transformed after the model of the Sunday schools instituted in 1758 by Robert Raikes. Charles of Bala was largely instrumental in the foundation of these schools and his work was continued in many other parts of Wales. At the same time he provided a sufficient number of Bibles and Testament at very moderate prices. Bishop Morgan's version of the Scriptures made in 1688 (final revision 1620) represents the speech of North Wales which had remained more or less less free from English influence, so that the language of the Welsh Bible is rightly regarded as the literary model. Three-fourths of the inhabitants of Wales belong to the various Nonconformist sects, and therefore pass almost without exception through the Sunday school, where they are drilled in its sole object of study, the Welsh Bible.

The increasing employment of Welsh owing to the Nonconformist movement has awakened a new interest in the past history of the principality. A society calling itself the Cymdeithas y Cymraeg was founded in London in 1751, and during the succeeding half-century two periodicals exclusively in Welsh were started. The recent structure of the poet and literary circles of the present century, and the fertility of the pen of the Welshman are thus explained.</br>

The revived. The origin of these literary festivals is shrouded in obscurity. It is recorded that a S. Welsh prince, Gruffydd ap Rhys, held a festival lasting forty days in 1135 to commemorate a victory over the Normans. It was, however, only 157 years later that the Nonconformist Sunday school, the pupil and the cedist were regarded as the most potent factors in resisting the inroads of the English language and what is now known as Welsh. Wales may be called the political and social history of the language is treated in great detail by H. Zimmer, "Der Pan-Keltismus in Grossbritannien und Irland," in Preussische Jahrbücher, vol. xii., (1898).

In the literature schools in Wales the use of Welsh has been permitted since 1893.

With regard to the extent to which Welsh is spoken a detailed map is given in J. E. Southall's Welsh Language Census of 1891 and the work of H. G. Jenkins and W. D. Gray. An account of the Deed about 2 m.W. of Conwa's Quay to Aberthaw in Glamorgan would practically include all those districts where Welsh is spoken by 60% of the population, and considerable deductions would have to be made for parts of Flint, Montgomery, most of Radnor and the north of Carmarthen. The coastal peninsula, South Glamorgan, or S. Pembrokeshire. Over much of Anglesey 97% of the population spoke Welsh and in parts of Cardiganshire 98.3%.

Of a total population in 1901 of 2,012,876, 929,824 were recorded as speaking Welsh. This is a very living language may be gathered from the following statistics. Between 1801 and 1898 no fewer than 8,259 volumes were published in the vernacular, whilst in 1895 there were appearing regularly 12 weekly and 19 monthly periodicals, and 25 weekly papers. In 1900 the number was probably greater. The danger for Welsh lies rather in the direction of internal decay. The speech of the people is saturated with English words and idiom, and the desire to be "modern" prevails instead of returning to the classical models of the 17th century.

Much remains to be done as regards the classification of the modern Welsh dialects. It is usual to divide them into four groups—

1. The three chief points on which N. and S. diverge is the pronunciation of the vowels i, u, y, which in the S. all tend to become e. The difference between N. and S. was noticeable as early as the 16th century. See Beiträge zur Geschichte des cymrischen Grammatik (Leipzig, 1887), also Rev. Celt. in Berlin, 64 ff., 113 ff., T. Darlington, "Some Dialectal Boundaries in Mid-Wales," Trans. of the Hon. Soc. of Cymrodorion, 1900-1901. The other dialects of the Welsh language, which are spoken in the south-west of Wales, are the W. of Glamorgan and the S. of the same county, and the W. of Monmouthshire, which is also spoken in the south-west of the county. W. Evans, The Text of the Mabinogion (Oxford, 1887); The Mabynian
Archaeology of Wales (1801-1807; reprinted Denbigh, 1870); W. F. Skene, The Four Ancient Books of Wales (2 vols., Edinburgh, 1868); Aneurin Owen, Ancient Laws and Institutes of Wales (London, 1841); facsimile edition by A. W. Wade-Evans, Welsh Medieval Law (Liverpool, 1987); A. P. Evans, The Prose Mabinogion (2 vols., Oxford, 1887); R. Williams, Selections from the Hengwrt Manuscripts (London, 1876-1892); J. E. Southall, Wales and Her Language (Newport, 1892). The earliest Welsh grammar was published as long ago as 1154 by Llywarch, precentor of the Monastery of the Holy Cross, as an appendix to the Revue celtique (Paris, 1883). An account of the language was prefixed to Owen Pughe's Dictionary (1803). During the 19th century many manuals of indifferent value saw the light of day, the first new edition of the Dictionary of the Welsh Language (Wrexham, 1835, 1876), (still, the most complete work), the same author also published a companion volume of Welsh Lexicon (Wrexham, n.d.); W. Spurrell, A Grammar of the Welsh Language (Carmarthen3, 1870); E. Anwyl, A Welsh Grammar (4th ed., 1903). There are also reprints and other manual for beginners—T. Jones, A Guide to Welsh (Newport, 1883); J. Evans, The Elements of Welsh Grammar (Newport, 1903). —The first Welsh dictionary was compiled by William Salesbury (London, 1547); facsimile reprint, London, 1877; W. Owen Pughe, A Dictionary of the Welsh Language (2 vols., London, 1833; reprinted Denbigh, 1870); W. Spurrell, Welsh-English and English-Welsh Dictionary (Llanelly, 1904), second edition (reprinted 2 vols. Wrexham, n.d.), and many others. A dictionary on a large scale was planned by D. Silvan Evans and subsidized by the government. Only A-DD has, however, appeared (Carmarthen, 1893-1901), but this has never been completed. (For pronunciation and the corrections. A survey of Welsh periodical literature is contained in T. M. Jones's Llyndysaith tâ Nghwelad (Treffynnon, 1893). For Welsh folklore see J. Rhys, Celtic Folklore, Welsh and Manx (Oxford, 1890); T. J. Jones, Dictionnaire Breton, (Revue celt., iii. 419 ff. See also G. Dottin, Revue de synthèse historique, vi. 317 ff.; H. Zimmer and L. C. Stern in Kultur der Gegenwart, Teil 1, Abt. xi. (E. C. Q.)

(b) Breton.—Breton (Bretonek) is the name given to the language spoken by those Britons who fled from the south-west of England to Armorica (see BRITANNY) in the 5th and 6th centuries. The period of migration has not yet been thoroughly investigated. The first migration probably took place about 450. The Dumnonii and Cornovii founded small states in Brittany, or Britannia Minor, as it was termed, and were followed in the second half of the 6th and into the 7th century by a long stream of refugees (cf. J. Loth, L'Emigration bretonne, Paris, 1883; A. de la Borderie, Histoire de la Bretagne, vol. i., 1905).

In the earliest stages it is difficult to distinguish Breton from Welsh. The history of the language may be divided into Old Breton from the 7th to the 11th centuries, Middle Breton from the 11th to the 14th, and Modern Breton from the 14th to the present day. The original material we possess consists of glosses and names occurring in lives of saints, Frankish authors, and charters. However, we find a few characteristics which serve to show that the old glosses are really Breton. Thus certain vowels are preserved in alliteration (au, av) in Old Breton, but remains é in Breton. Breton gr. becomes g in French. Further, in O. W. pretonic é is weakened to an indeterminate sound written ą and later y, a phenomenon which does not occur in Breton, e.g. the accent is withdrawn during the middle period from the final vowel in the case of such words as celt. et cæter. In Breton, e.g. kelt. cælebr. In Breton, kelt. ă is weak, which is a feature that is preserved in the modern language in written and later in Old Breton they pass into zl, which in the modern language appear as er, el; e.g. Mod. Br. lalr, Mod. Br. laler, ropper, W. ller, lat. later, later. Welsh ylalr, ylaler, ylalr, yllîr, W. alll; Br. aurren, "lord," I. latram, W. allorw, alorw, Corn. alorw; and, more important still, ih, y (W. dd) become s, s, e.g. Mid. Br. deneff, "sword," Mod. Br. kette, W. cyddyf. The orthography only serves to indicate pronunciation very slowly, and it is only until 1859 that we find any attempt made to give a complete representation of the spoken language. A Jesuit priest, Julien Maunois (Br. Maner), published a manual in which a new spelling is employed, and it is usual to date Modern Breton from the appearance of this book, although in reality it may not have appeared until somewhat later. It is certain, however, that the initial mutations are consistently denoted in writing (medially they are already written in the 11th century), and the differences between the dialects first come into view at this time. As in Welsh the accent is withdrawn during the middle period from the final vowel in the penultimate (except in the Vannes dialect), which causes the modern unstressed vowel to be reduced in many cases. Again, in Old Welsh and Old Breton a short stressed vowel in words of one syllable was lengthened, e.g. W. lîd, "father," pl. lîdau, but in Modern Breton the accent tends to lengthen all stressed vowels. Breton has gone its own way in the matter of initial mutation. The nasal mutation has been entirely given up in the initial position, whilst a new mutation appears, viz. the diphthongisation of i before k, t after a few words which originally ended for the most part in i or ch. The vocalic mutation of initial k in Breton is c'h. We may also make mention of one or two other points which distinguish Modern Breton from the other subdialects. First, the combination ng, e.g. Mid. Br. tooe, Mod. Br. mione, has given up the combination and ended up in the Old Breton k, etc., “sick,” I. claf, M. Ir. clarn. Finally after r and l and sometimes in monosyllables after a vowel is represented in Breton by c'h, whilst in Old Breton in the case we find a vowel and in the other nil, e.g. Br. ech. “we know.”

The numerical value of the Welsh mb, md immediately preceding the stress appear in the modern language as mm, nn, but in Breton we find mp, nt, e.g. Br. kanid, “candle,” W. canwyll, L. candze, Br. kemper, “confluence (in sense),” breezer, i.e. cembre, i.e. cembre.

With regard to the extent of country over which Breton is spoken we shall do well to note the seats of the old Breton bishoprics. These were Quimper, St Pol de Léon, Tréguier, St Brieuc, St Malo, Dol and Vannes. Under Count Nominoe the Bretons succeeded to mock the Frankish yoke (841-845) and founded an independent state. At this time of greatest political expansion the language boundary was formed by a line which started roughly a little to the west of Morbihan and included the smaller country up to the mouth of the Loire. During the next three centuries, however, in consequence of political events which cannot be enumerated here, we find French encroaching rapidly on Breton, and the old dioceses of Quimper and Léon were absorbed. The situation in the Celtic countries in general has been amply described in a recent work by Comte (J. Loth, Revue celtique, xxvii. 374-493). So that since the 13th and 14th centuries the boundary between French and Breton begins in the north about Flousa (west of St Brieuc Bay), and comes down to the estuary of the Sèvre Niortaise. To say, the Breton speakers are confined to the department of Finistère and the west of the departments Côtes-du-Nord and Morbihan. Lower Brittany contains a population of 1,560,000, of whom roughly 1,250,000, or Breton, living in the three departments of Côtes-du-Nord, Morbihan, and Lower Brittany, have been reduced to 768,000 in 1876, 679,000 in 1885, and over 500,000 in 1898. There is an infinity of dialects and subdialects in Brittany, but it is usual to divide them into four groups. These are the dialects of A. Léon, or the Lower Brittany; the Côtes-du-Nord and a part of Morbihan; (3) Tréguier in the Côtes-du-Nord and Finistère; (4) Vannes in Morbihan and a portion of the Côtes-du-Nord. The first three resemble one another fairly closely, but the speech of Vannes has gone its own way entirely. The dialect of Léon is regarded as the literary dialect, but its close connection with the language of ancient Gaul is an advantage. The modern language is unfortunately saturated with words borrowed from French. For its vocabulary and grammar the reader is referred to Cornouailles, and its literature to the Breton of Finistère. The language is one of the most interesting in their literature to the Breton of Finistère. The language is one of the most interesting in the world, and the study of its literature is one of the most rewarding. The quotations given are from the standard work of Cornouailles, and its literature to the Breton of Finistère. The language is one of the most interesting in the world, and the study of its literature is one of the most rewarding.
example fired a number of writers with zeal for their native tongue and the clergy became interested. Under their auspices manuals of Breton were published and the language was utilized in a number of schools. A society called the Association Bretonne was founded in 1838, and under this body the Breton movement did not slow down. It is easy to discover, this Breton awakening was declared to be contrary to the interests of the state, and all the means at the disposal of a highly centralized government like that of France were used to throttle the movement. Down to the present day the use of Breton is strictly forbidden in all the state schools, and the influence of the Roman Catholic clergy has for the most part been hostile to the language. However, the advantage of the government was that the Breton population is not homogeneous and there were always in Breton the dialects of the people living on the coast. The same is true of inland Breton, in which the dialects have disappeared.

In 1898 was founded the Union Régionaliste Bretonne, the most important section of which endeavours to foster the national spirit in conjunction with the Comité de protection du breton, founded 1896. In 1899 the annual meeting of the U.R.B. was modelled on the lines of the Irish Oireachtas, the Welsh Eisteddfod and the Scottish Mòd, and festivals of this kind have been held ever since. Many Breton newspapers publish columns in Breton, thus At Breizh (Vannes) and At Breizh (Lorient) (in French). Carlhaw (in Breton) frequently devotes half its columns to the language. But there is also a weekly four-page newspaper which is wholly in Breton. This is Kroz ar Vretoned, edited by F. Véllée and published at St Brieuc, Breizh; and there is a literary periodical in Breton, Vannetais, which is printed from a French press in Paris and is read in Breton. The first is At Vro, edited by the poet Jaffrenou, and in 1908 in its fifth year.

The second is Dihunamm, written in the dialect of Vannes and started in 1905. The third is Peizh ha Breizh (Lorient, 1898-1904).

III. LANGUAGE OF THE ANCIENT PICTS.—The evidence from which we can draw any conclusions as to the affinities of the language of the Picts is so extremely scanty that the question has been the subject of great controversy. The Picts were first mentioned by Eumenius (A.D. 297), who regarded them as having inhabited Britain in the time of Caesar. In the year 358 they were described by Ammianus Marcellinus as invading the Roman province of Britain in conjunction with the Irish Scots. In Columba's time we find the whole of Scotland east of Drumblain and north of the Forth divided into two kingdoms—north and south Pictland—and it is reasonable to identify the Picts, at any rate in part, with the Caledonians of the classical authors. Galloway and Cowan were also inhabited by Picts. Following the language of the Picts is noticed in the Brittonic languages, and mentions of the Britons, Picts, Scots, Irish and English. The fact that the Picts are known in history have aroused considerable discussion. It seems natural to connect Lat. Picti with the Pictones and Pictavi of Gaul, but in Irish they are known as Cruithne, which appears in Welsh as Prydyn, "Picti"; cp. Prydwen, “Britain,” forms corresponding to the earliest Greek name for these islands, Ἰπποδαυλία.

Three conflicting theories have been held as to the character of the Pictish language. Rhy's, relying on the strange character of the Scottish Ogam inscriptions, pronounces it to be non-Celtic and non-Indo-European. In this he has been followed by Zimmer, who bases his argument on the Pictish rule of succession. Skene maintained that the Picts spoke a language nearly allied to Godic, whilst Stokes, Loth, Macbain, D'Arbois and Meyer are of opinion that Pictish was more closely related to Welsh and Breton.

In 936 the "Welsh" were driven out of Exeter by the Welsh. In 1066 the Welsh were driven out of Cornwall by the Welsh. In 1100 the Welsh were driven out of Cornwall by the Welsh. In 1204 the Welsh were driven out of Cornwall by the Welsh. In 1354 the Welsh were driven out of Cornwall by the Welsh. In 1454 the Welsh were driven out of Cornwall by the Welsh. In 1504 the Welsh were driven out of Cornwall by the Welsh. In 1594 the Welsh were driven out of Cornwall by the Welsh. In 1694 the Welsh were driven out of Cornwall by the Welsh. In 1794 the Welsh were driven out of Cornwall by the Welsh. In 1894 the Welsh were driven out of Cornwall by the Welsh. In 1994 the Welsh were driven out of Cornwall by the Welsh.
to Brythonic. Of personal names mentioned by classical writers we have Calgacus and Argentocorbus, both of which are certainly Celtic. The names occurring in Ptolemy’s description of Scotland we have a decidedly Celtic character, and they seem to, bear a greater resemblance to Brythonic than to Goidelic, witness such tribal designations as Epiddi, Cornavii, Dannonii, Decantae, Novantae. In the case of all these names, however, it should be borne in mind that they probably reached the writers of antiquity through Brythonic channels. Bede mentions that the east end of the Antonine Wall terminated at a place called in Pictish Pean-fashel, and in Saxon Pennellun. Pean resembles Old Welsh pen “head.” Old Irish cenn, and the second element may possibly be connected with Gaelic fál, Welsh gwasel, “rampart.” The names of the kings in the Pictish chronicles are not an absolutely trustworthy guide, as owing to the Pictish rule of succession the bearers of the names may in many cases have been Brythons. The names of some of them occur in one source in a Goidelic, in another in a Brythonic form. It is of course possible that the southern part of Pictish territory was divided between Goidels and Brythons, the population being very much mixed. On the other hand there are a number of elements in place-names on Pictish ground which do not occur in Wales or Ireland. Such are pet, piti, “farm” (?), fer, father, foder, “lower” (?). Aber, “confluence,” on the contrary, is pure Brythonic (Gaelic inner). Though the majority of scholars are of opinion that Pictish was nearly akin to the Brythonic dialects, we are entirely in the dark as to the manner in which that language was ousted by the Goidelic speech of the Dalriadic Scots. In view of the comparatively unimportant part played for a considerable period in Scottish affairs by the colony from Ireland, it is well-nigh incredible that Pictish should have been supplanted by Gaelic.

IV. HISTORY OF CELTIC PHILOLOGY.—For many centuries the affinities of the Celtic languages were the subject of great dispute. The languages were in turn regarded as descended from Hebrew, Teutonic and Scythian. The first attempt to treat the dialects comparatively was made by Edward Lhuyd in his Archaeologia Britannica (Oxford, 1707), but the work of this scholar seems to have remained unnoticed. A century later Adelung in Germany divided the dialects into true Celtic (=Goidelic) and Celtic insular (=Brythonic). But it was a long time before it was generally recognized that these languages belonged to the Indo-European family. They were exclusively by Bopp in his comparative grammar, though he did not fail to notice certain analogies between Celtic and Sanskrit. James Pritchard was the first to demonstrate true relationship of the group in his Eastern Origin of the Celtic Nations (London, 1831), but his conclusions were not accepted. As late as 1836 Pott denied the Indo-European connexion. A year later Pictet resumed Pritchard’s arguments, and Bopp himself in 1838 admitted the languages into the charmed circle, showing in an able paper entitled Über die keltischen Sprachen that the original mutations were due to the influence of terminations now lost. But it was reserved to a Bavarian historian, J. C. Zeuss (1806-1856), to demonstrate conclusively the Indo-European origin of the Celtic dialects. Zeuss, who may worthily rank with Grimm and Diez among the greatest German philologists, rediscovered the Old Irish glosses on the continent, and on them he reared the magnificent structure which goes by his name. The Grammatica Celtica was first published in 1833. The material contained in the monumental work was greatly extended by a series of important publications by Whitley Stokes and Hermann Ebel, so much so that the latter was commissioned to prepare a second edition, which appeared in 1871. Stokes has rendered the greatest service to the cause of Celtic studies by the publication of countless texts in Irish, Cornish and Breton. In 1870 the Revue celtique (vol. xxviii.) was founded by Henri Gaidoz, whose mantle later fell upon H. d’Arbois de Jubainville. In 1879 E. Windisch facilitated the study of Irish by publishing a grammar of Old Irish, and a year later a volume of important Middle Irish texts with an exhaustive glossary, the first of its kind. Since then Windisch and Stokes have collaborated to bring out some of the greatest monuments of Irish literature in the series of Irische Texte. The text of the Würzburg glosses was published by Zimmer (1881) and by Stokes (1887), and that of the Milan glosses by Ascoli. An important step forward was the discovery of the laws of the Irish accent made simultaneously by Zimmer and Thurneyssen. This discovery led to a thorough investigation of the difficult verb system of Old Irish—a task which has largely occupied the attention of Strachan in England, Thurneyssen and Zimmer in Germany, and Pedersen and Sanau in Denmark. In a sense the publication of the Thesaurus Palacohibernicus (Cambridge, 1901-1903) may be regarded as marking the close of this epoch. The older stages of Irish have hitherto so monopolized the energies of scholars that other departments of Celtic philology save Breton have been left in large measure unworked. J. Strachan had begun to tap the mine of the Old Welsh poems when his career was cut short by death. J. Loth and E. Ernauld have concentrated their attention on Breton, and can claim that the development of the speech of Brittany has been more thoroughly investigated than that of any other Celtic language. The number of periodicals devoted entirely to Celtic studies has increased considerably of recent years. In 1896 K. Meyer and L. C. Stern founded the Zeitschrift für celtische Philologie (now in its 7th volume), and in 1897 the Archiv für celtische Lexigraphie began to appear under the direction of K. Meyer and W. Stokes. As a supplement to the latter Meyer has been publishing his invaluable contributions to Middle Irish lexicography. In Ireland a new periodical styled Éiriu was started by the Irish School of Learning in 1904. The Scottish Celtic Review, dealing more particularly with Scottish and Irish Gaelic, began to appear in 1903, and the Transactions of the Gaelic Society of Inverness are in the 25th volume. For Wales we have Y Cymmodor since 1877, and the Transactions of the Hon. Society of Cymmodorion since 1892, and for Brittany the Annales de Bretagne, published by the Faculty of Letters at Rennes (founded 1886).

See V. Tourneur, Esquisse d’une histoire des études celtiques (Liège, 1905). (E. C. Q.)

Celtic Literature

1. Irish Literature.—In the absence of a native coinage it is extremely difficult to say when the use of letters was introduced into Ireland. It is probable that the Latin alphabet first came in with Christianity. With the exception of the one bilingual Ogam inscription as yet discovered in Ireland (that at Killeen Cormac) all the inscriptions in Roman letters are certainly later than 500. Indeed, apart from the stone reading “LIE LUGUAEDON MACCI MENEUH,” they are all contemporary with or later than the Old Irish glosses. With regard to the Ogam inscriptions we cannot make any confident assertions. Owing to the lack of criteria for dating certain Irish sound-changes accurately it is impossible to assign chronological limits for the earlier stones. The latter cannot be later than the 5th century, but there is nothing to show whether they are Christian or not, and if pagan they may be a century or two earlier. It is true that the heroes and druids of the older epics are represented in the stories as making constant use of Ogam letters on wood and stone, and as the story of civilization described in the oldest versions of the Ulster sagas seems largely to go back to the beginning of the Christian era, it is not impossible that this peculiar system of writing had been
framed by them. The Ogam system is certainly based on the Latin and not the Greek alphabet, and was probably invented by some person from the south of Ireland who received his knowledge of the Roman letters from traders from the mouth of the Loire. It may, however, be regarded as certain that the Ogam script was never employed in early times for literary purposes. We are told that the Gaulish druids disdained to commit their lore to writing, although they were familiar with the use of Greek letters, and their Irish confrères probably resembled them in this respect. Tradition connects the codification of the Brehon Laws with the name of Patrick, and there is reason for believing, as we shall see later, that the greatest Irish epic was first committed to writing in the 7th century.

The great bulk of Irish literature is contained in MSS. belonging to the Middle Irish period (1100-1550), and in order to be able to treat this literature as a whole it will be convenient for us to deal first with those documents which are termed Old Irish, especially as the contemporary remains of the literature of the earlier period are almost exclusively of a religious nature. Most of the Old Irish documents have been edited by Stokes and Strachan in the *Thesaurus Palaeohibernicus*, and where no reference is given the reader is referred to that monumental work. The extraordinary outburst of intellectual activity in Ireland from the 6th to the 7th centuries and the compositions of Irishmen in the Latin language, belong to the history of medieval European literature and fall outside the scope of this article. For the *Confession of St Patrick* and his "Letter to the Subjects of Coroticus" see *Patrick*. The only Irish document ascribed to the saint is the strange so-called "Hymn," the *fiath fada*, more properly *fóid fada*, "the cry of the deer." This is a rhetorical incantation which is said to have rendered the saint and his companions invisible to King Loiglaoi and his druids. The Trinity and powers of nature are invoked to help him to resist spells of women and smiths and wizards. The hymn, which contains a number of strange grammatical forms, is undoubtedly referred to in the Book of Armagh, and may very well go back to the 7th century, The Latin hymns contained in two MSS. dating from the end of the 8th or beginning of the 9th century, a Trinity College, Dublin, MS., and a MS. belonging to the Franciscan monastery in Dublin, are of interest to us as exhibiting the influence of the native metrical system. Quantity and elision are ignored, and rhymes, assonances, alliterations and harmonies abound in true Irish fashion. The line consists of two units which commonly contain either seven or eight syllables apiece. The earliest and best-known of these religious poems are the *Hymn of Secundinus* (Sechnall d. 447) on St Patrick, and the two hymns attributed to St Columba (d. 597) beginning "Noli pater" and "Altus prostrator," the latter of which exhibits some of the peculiarities of the so-called Hibernian Latin of the *Hesperica Fawina* and the *Loric* of Gildas. The date of the Irish hymns in the *Liber Hymnorum* ranges, according to Stokes and Strachan, from the 7th to the 11th centuries. Ultán’s hymn on St Brigid beginning "Brigí be bíbhíatha," which is by far the most artistic of the collection, was perhaps composed in the 7th century. Definite metrical laws had evidently been elaborated when this poem was written. The best is iambic, but the natural accent of the words is rigidly observed. The long line consists of two units of five syllables each. The rhymes are dissyllabic and perfect. Alliteration is always observed in the latter half of each line and assonances are found knitting up the half-lines. The short prayer ascribed to Ninine or to Fiacc is a highly alliterative piece without rhyme, the date of which cannot be fixed. The well-known hymn on St Patrick traditionally ascribed to Fiacc, bishop of Sletty, and the piece beginning "Sén Dé," traditionally ascribed to Colmán, are assigned on linguistic grounds to the beginning of the 9th century. The lines going by the name of "Sanctán’s Hymn" probably belong to the same century, whilst the metrical catalogue of marvels performed by St Brigit contains such a medley of older and later forms, probably due to interpolation, that it is impossible to determine its age. The few lines entitled "Mael-Ísu’s Hymn" are the most recent of all and probably belong to the 11th century.

(Mael-Ísu d. 1086). The Patrickian documents by Muirchuí Macchu Machthêni, who professed to write at the command of Bishop Aed of Sletty (d. 698), and by Tircháín, who is said to have received his information from Bishop Ullán (d. 656), are contained in the Book of Armagh, a MS. compiled by Ferdiomnach in 897. These documents, like the *Life of St Columba* by Adamnan, the MS. of which was written by Doroibne, abbot of Hi (d. 713), contain a number of names and forms of great importance for the study of the language.

The earliest pieces of connected prose in Irish are three:-

(1) The Cambray Homily, contained in an 8th-century codex at Cambray copied by a continental hand from a MS. in the Irish character; the language is very archaic and dates from the second half of the 7th or the beginning of the 8th century; (2) the additions to the notes of Tircháin on the life of St Patrick in the Book of Armagh; these seem to go back to the early 8th century; (3) the tract on the Mass in the Stowe Missal, which is in all probability nearly as old as the Cambray Homily, though contained in a 9th or 11th century MS.

Of especial interest are the spells and poems found in the Stowe Missal and two continental MSS. The Stowe MS. (now deposited in the Royal Irish Academy) contains three rather badly preserved spells for a sore eye, a thorn and disease of the urine. A St Gall codex has preserved four Irish incantations of the 8th and 9th centuries. These are respectively against a thorn, urinary disease, headache and various ailments. Another charm, which is partly obscure, occurs in the 10th-century codex preserved at the monastery of St Paul in Carințhia. The same MS. also contains (1) a humorous poem treating of the doings of a bookish writer and his favourite cat Pangur Bàn; (2) a riddling poem ascribed to Subine Geilt, a king who is said to have lost his reason at the battle of Moira (A.D. 637); (3) verses extracted from a poem ascribed to St Moling (d. 697), who may very well have been the actual author; (4) a poem in praise of some Leinster princeling called Aed.

For our knowledge of the older language, however, we have to rely mainly on the numerous glosses scattered about in a large number of MSS., which it is impossible to enumerate here. Indeed, such an enumeration is now rendered superfluous owing to the publication of the *Thesaurus Palaeohibernicus*, in which all the various glosses have been collected. For our purpose it will be sufficient to mention the three most important codices containing Old Irish glosses. These are as follows:—(1) The Codex Paulinus at Würzburg, which contains the thirteen epistles of St Paul, and the Epistle to the Hebrews, with a great mass of explanatory glosses, partly in Latin, partly in Irish, partly mixed. The chief source of the commentary is the commentary of Pelagius, who is often cited by name. The date of this highly important MS. is much disputed; part of the Irish glosses seem to date from about 700, whilst the rest may be placed a little before 800. (2) The Codex Ambrosianus, formerly at Bobbio, now at Milan, which contains a commentary on the psalter with a large number of Irish glosses. In their present state these glosses were copied in the first half of the 9th century. (3) Glosses on Friscian contained in four MSS., from which the most important is the Codex Sangallensis, dating from the middle of the 9th century. Apart from the biblical glosses and scholia the other chief texts or authors provided with Irish glosses are Augustine, Bede, the Canons, the Computus, Eutychius, Juvenicus, Philargyrius, Prudentius and Servius.

The Milan and the St Gall codices just mentioned both contain several short poems in Irish. In two stanzas in the Swiss MS. we find expressed for the first time that keen sympathy with nature in all her moods which is so marked a feature of Irish and Welsh verse.

Two ponderous religious poems have now to be noticed. To Oengus the Culdee is attributed the lengthy *Félire* or Calendar of Church Festivals, consisting of 465 quatrains in *rinnard* metre, one for each day in the year. The language of this dry compilation, which is heavily glossed and annotated, points to 800 as the date of composition, and Oengus, who is stated to have
lived about that time, may well have been the author. This calendar has been twice edited by W. Stokes with an English translation, the first time for the Royal Irish Academy (Dublin, 1888), and again for the Bradshaw Society (London, 1905).

It may perhaps be as well to enumerate here the later Irish martyrologies. (1) The Martyrology of Tallaght (Tamlacht), founded on an 8th-century calendar, but containing additions down to 900 (ed. D. H. Kelly, Dublin, 1857). (2) The metrical Martyrology of O’Gorman, c. 1166-1714, edited by Stokes for the Bradshaw Society (London, 1893). (3) The Martyrology of Donegal, an important compilation in prose made by Michael O’Clery in 1630, edited by J. H. Todd (Dublin, 1864). The composition which wrongly assigned to Oengus the Culdee is the Saltair na Rann or Psalter in Quatrains, contained in an Oxford MS. (Rawlinson B 502) and published without a translation by Stokes (Oxford, 1883). The work proper consists of 150 poems corresponding to the number of Psalms in the psalter, but 12 poems have been added, and in all it contains 2098 quatrains, chiefly in dehíde metre of seven syllables. The poems are mainly based on biblical (Old Testament) history, but they preserve a large measure of medieval sacred lore and cosmogony. The psalter received additions as late as 905, and the Oxford MS. belongs to the time of the Royal Irish Academy. Here, the famous Amra or Eulogy of St Columba, commonly attributed to Dallán Forgaill, a contemporary of the saint, but Stokes takes the view that it was written in the 9th century, and is intentionally obscure. The oldest but not the best copy of the Amra is preserved in the Trinity College, Dublin, MS. of the Liber Hymnorum, but it also occurs in L. and elsewhere. It invariably appears heavily gloss-laden, and the glosses and commentary added thereto are out of all proportion to the text. This piece, which is not extant in its integrity, was probably intended as artificial alliterative prose, but, as we have it, it is a medley of isolated phrases and irrelevant comment.

During the 9th and 10th centuries Ireland was harried by the Vikings, and a host of scholars seem to have fled to the continent, carrying with them their precious books, many of which are preserved in Italy, Switzerland, Germany and elsewhere. Hence very few early Irish MSS. are preserved in Ireland itself. When the fury of the storm was past, Irish scholars showed increased interest in the old documentary literature, and began to carry off and MSS. mislabeled codices. The earliest of these collections, such as the Cín of Drúim Snéchta, the Yellow Book of Slane, the Book of Dubhdaileithe, the Psalter of Caisle, exist no longer, though their names have come down and certain of them were known in the 17th century. However, copies of a goodly portion of the contents of these old books are preserved to us in one form or another, but mainly in a series of huge miscellaneous codices ranging in date from the 12th to the 16th century. The oldest is Lebor na hArdre, or Book of the Dun Cow, preserved in the Royal Irish Academy and published in facsimile (Dublin, 1870). This MS. was compiled in part in the monastery of Clonmacnoise by Moelmuire MacCelechair, who was slain in 1106. The Book of the Dun Cow (where necessary we shall abbreviate as L.U.) derives its name from a legend that Claran of Clonmacnoise (d. 544) took down the story of the Táin Bó Cúalnge on a parchment made from the hide of his favourite cow. The name seems to have been wrongly applied to the 11th-century MS. in the 15th century. L.U. is almost entirely devoted to romances, the stories which it contains belonging mainly to the Ulster cycle. The next MS. in point of age is the Book of Leinster (abbreviated LL.) now in Trinity College, Dublin.

It was transcribed by Finn, son of Gorman, bishop of Kildare (d. 1160). LL. also contains a large number of romances in addition to other important matter, mainly historical and genealogical, bearing more particularly on the affairs of Leinster. The Yellow Book of Lecan (YBL.), also in Trinity College, Dublin, was written at different times by the MacFíbris family, but chiefly by Gilla Isra, son of Donnchad Mór MacFíbris about 1391. The MacFíbris were hereditary scribes and genealogists to the O'Dowds, chiefs of the Hy Fiachrach (Co. Sligo). YBL. contains a vast amount of romance, and is indispensable as supplementing and checking the contents of LL. and L. The most extensive collection of all is the Book of Ballymote (BB.), now belonging to the Royal Irish Academy, which was compiled about the beginning of the 15th century by various scribes. The book was in the possession of the chiefs of Ballymote for more than a century. In 1522 it was purchased by the O'Donnells for 140 milch cows. BB. only contains little romantic matter, but it has preserved the most valuable historical and genealogical material. The contents of the Leabhar Breac (L.B.), or Speculck Book, now in the Royal Irish Academy, are chiefly ecclesiastical and religious. L.B. seems to have been compiled in large measure before 1544. All these five codices have been published in facsimile by the Royal Irish Academy with a description of their contents. Two important Mid. Ir. MSS. in the Bodleian (Rawlinson B 512 and Laud 610), containing a good deal of romantic material, are also published in facsimile by Henry Frowde. Other MSS. which require special mention are (1) The Great Book of Lecan, compiled in the year 1417 by Gilla Isra Mór MacFíbris for the Royal Irish Academy, (2) The Book of Lismore, the property of the Duke of Devonshire at Lismore Castle. This codex was compiled in the latter half of the 15th century from the lost book of Monasterboice and other MSS. Its contents are described in the introduction to Stokes's Lives of Saints from the Book of Lismore (Oxford, 1890). (3) The Book of Fermy in the Royal Irish Academy. The contents are described in the introduction to O’Beirne Crowe’s edition of the Táin Bó Fraích (Dublin, 1870). (4) The Book of Hy Maine recently acquired by the Royal Irish Academy. The scribe who wrote it died in 1372. O’Curry, O’Longan and O’Beirne Crowe drew up a MS. catalogue of the Irish MSS. in the Royal Irish Academy, and O’Donovan performed the same service for the Trinity College, Dublin, collection. A brief account of the Irish MSS. in TCD. will be found in Abbott’s Catalogue of the MSS. in that library. O’Curry also drew up a list of the Irish MSS. in the British Museum, and S. H. O’Grady has printed part i. of a descriptive catalogue of this collection (London, 1901), part ii. by T. O’Maille. The twenty-six MSS. in the Franciscan monastery in Dublin are described by J. T. Gill, published in the Report of the Commission on Historical MSS. W. F. Skene catalogued the collection of MSS. in the Advocates’ Library, Edinburgh, a printed catalogue of which has been issued by D. Mackinnon (Edinburgh, 1909; see also Trans. Gaelic Soc. of Inverness, xvi. 285-309).

In order to give some idea of the enormous extent of Irish MS. material we may quote some calculations made by O’Curry, who states that if the five oldest vellum MSS. were printed the result would be 9400 quarto pages. Other vellum MSS. ranging in date from 1300 to 1600 would fill 9500 pages of the same size, whilst the innumerable paper MSS. belonging chiefly to the early 18th century would cover no less than 30,000 pages. The well-known French scholar, D’Arbois de Jubainville, published in 1883 a tentative catalogue of Irish epic literature. His work is by no means complete, but his figures are instructive. He mentions 953 Irish MSS. containing epic matter preserved in Irish and English libraries. To these have to be added another 56 in continental libraries. Of this mass of material 133 Irish and British MSS. and 35 continental MSS. were written before 1600. He should, however, be stated that the same subject is treated over and over again, and much of the later material is absolutely valueless.

Before we pass on to the consideration of the literature itself, it will be well to make a few preliminary observations on the nature of the language in which the pieces are written and on the status of the poet in medieval Ireland. The language in which the huge miscellaneous codices enumerated above are contained is called by the general name of Middle Irish, which is a very wide term. Irish scribes often copied their original somewhat mechanically, without
becoming to change the language to that of their own time. Thus in many parts of LL. we find a thin Middle Irish veneer on what is largely Old Irish of the 8th or 9th century. Hence such a MS. often preserves forms which had been current several centuries before, and it may even happen that a 14th or 15th century MS. such as YBL. contains much older forms than a corresponding passage in LL. Of recent years several scholars—
 notably Strachan—have devoted much attention to the Old Irish verb-forms, so that we have now safe criteria for establishing with some degree of certainty the age of recensions of stories and poems preserved in late MSS. In this way a number of compositions have been assigned to the 9th, 10th and 11th centuries, though actual written documents belonging to this period are comparatively rare.

It remains for us to say a few words about the fíli, the professional literary man in Ireland. The fíli (from the stem vel- to see) Welsh, Breton, gwelet, " to see") appears to have been originally a diviner and magician, and corresponds to the sages, ollamh, of the ancient Gauls mentioned by classical writers. In Ireland he is represented as sole possessor of three methods of divination: the imbas forannó, tirteal sid, or "divining fire" of the Tain celebrated cycle. The first two of these were forbidden by Patrick, but they seem to have survived as late as the 10th century. Part of the tremendous influence exercised by the fíli was due to the belief in his powers of satire. By reciting a satirical poem or incantation he was able to raise boîches on the face of and so disfigure anyone who aroused his displeasure. Numerous cases of this occur in Irish literature.

The origin of the science of the fíli is sometimes traced back to the Dagda, one of the figures of the Irish pantheon, and they were held in such esteem that the annalists give the obituaries of the head-ollamh as if they were so many princes. With the introduction of Christianity they seem to have gradually superseded the druid, and their functions are therefore very wide. We are told that they acted in three capacities: (1) as storytellers (for ceomne or scéilda); (2) as judges (brihtem), including the professions of arbitrators, legislators and lawyers; (3) as poets proper (forcere). We are here only concerned with the fíli in his capacity of story-teller and poet. In accordance with the minute classification of the various ranks of society in early Ireland, the social status of the literary man was very carefully defined. The degrees vary slightly in different documents, but the following list of ten from the Senchus Mór is very instructive: (1) The highest degree is the ollamh (ollacc), who knows 350 stories; (2) the druth, 175 stories; (3) the dlí, 80 stories; (4) the cana, 60 stories; (5) the dois, 50 stories; (6) the macfuirmid, 40 stories; (7) the fichlocon, 30 stories; (8) the drísa, 20 stories; (9) the taman, 10 stories; (10) the ollabar, 7 stories. In LL. we are told that the stories (scéide) are divided into primary and secondary, and that the latter are only obligatory on the first four of the grades enumerated. Again, certain styles of composition seem to have been the monopoly of certain grades. Thus the poem which was most highly rewarded and demanded the highest technical skill was called the ammain, and was the exclusive right of the ollamh. A notable instance of this kind of composition is the Amra of Columba, attributed to Dallán Forgall. The higher grades were allowed a number of attendants, whom the kings had to support along with the poet himself. Thus the fichlocon had two and the dois four attendants. In the 6th century Dallán Forgall, the chief fíli of Ireland, claimed the right to be attended by thirty fíli, which was the number of the train allowed to the supreme king. The reigning monarch, Aed MacAinmirech, weary of the pretensions of the poets, attempted to banish them, which led to the famous assembly of Druim Ceta, where Columba intervened and reduced the number to twenty-four (the train of a provincial king). In the plan of the hall of Tara, preserved in LL. and YBL., the sui liotre or doctor in theology has the seat of honour opposite the king. The ollamh brihtem or supreme judge or lawyer ranks with the highest rank of nobility, whilst the ollamh fíli is on a footing with the nobleman of the second degree.

We have already stated that the stories which formed the stock-in-trade of the poets were divided into primary and secondary stories. Of the latter there were 100, but little is known of them. However, several more or less complete lists of the primary stories have come down to us. The oldest catalogue (contained in LL.) gives the titles of 187 of these tales arranged under the following heads—destruction, cow-spoils, courtships, battles, caves, navigations, violent deaths, expeditions, eloopenmes and confabulations; together with the following, which also reckon as prime-stories—irruptions, visions, loves, hostings and migrations. Of these stories sixty-eight have been preserved in a more or less complete form. The tales enumerated in these catalogues, which in their substance doubtless go back to the 8th or even to the 7th century, fall into four main categories: (1) the mythological cycle, (2) the Cuchulinn cycle, (3) the Finn cycle, (4) pieces relating to events of the 5th, 6th and 7th centuries. Meyer has estimated that of the 550 titles of epic tales in D’Arbois’s Catalogue about 400 are known to us, though many of them only occur in a very fragmentary state; and about 100 others have since been discovered which were not known in 1883. The task of the fíli was evidently a very laborious one. It is commonly stated to have extended over twelve years, at the end of which time the student was thoroughly versed in all the legendary, legal, historical and topographical lore of his native country, in the use of the innumerable and excessively complicated Irish metres, in Ogam writing and Irish grammar. The instruction in the schools of poetry seems to have been entirely oral, and the course consisted largely in learning by heart the verses in which the native lore was enshrined. These schools of learning existed in one form or another down to the 17th century. In the early days the fíli is represented as employing a mysterious archaic form of speech—doubtless full of obscure kennings—which was only intelligible to the initiated. An instance of this bírfa feinse, as it was termed, is the piece entitled Acolam an Dá Shaidd (Colloquy of the Two Sages, Rev. coll. xxvi. 4 fl.). In this piece two fíli of the 1st century A.D. are represented as contending in this dialect for the office of chiel, on ibrum of Ireland, much to the chagrin of King Conchobar, to whom their speeches were unintelligible. It was in consequence of this that Conchobar ruled that the office of fíli should no longer carry with it of necessity the office of judge (bríthem). It ought to be observed that the church never showed itself hostile to the fíli, as it did to the druids. Dubthach, chief fíli of Ireland in the time of St. Patrick, is represented as the saint’s constant companion, and the famous Flann Mainistrech (d. 1056), though a layman and fíli, was head of the monastery school at Monasterboice.

Before leaving the subject of the literary classes, we must notice an inferior grade of poet—the bard. Like the official fíli, the bard was divided into grades. There were both patrician and plebeian bards, each subdivided into eight degrees, having their own peculiar metres. Like the fíli the bard had to go through a long course of study, and he was generally attached to the house of some chieftain whose praises he had to sing. In course of time the office of fíli became extinct, owing to a variety of causes, and from the 13th to the 16th century we find the hitherto despised family bard stepping into the place of the most influential literary man in Ireland. His importance was fully realized by the English government, which did its best to suppress the order.

The medieval romances form by far the most important part of Irish literature, and it is to them that we shall first turn our attention. Two main groups of stories have to be distinguished. The one is the Ulster cycle, with Conchobar and Cúchulinn as central figures. The other is the Southern or Leinster-Munster cycle, revolving round Finn and Ossian. Further stories dealing with mythological and historical personages will be mentioned in their turn.

The Ulster cycle may be regarded as Ireland’s most important contribution to the world’s literature. The chief and at the same time the lengthiest romance in which the heroes of this group figure is the great epic, the Táin Bó Cúalnge or the
Cattle-raid of Cooley (Co. Louth). Here we find ourselves in a world of barbaric splendour, and we are constantly reminded of the Iliad, though the Irish epic from a purely literary point of view cannot bear comparison with the work of Homer. The main actors in the drama are Conchobar, king of Ulster, the great warrior Cuchulinn (see CUCHULINN), Ailill and Medb, king and queen of Connaught, and Fergus, Conchobar’s predecessor as king of Ulster, now in exile in Connaught. These persons may or may not have actually lived, but the Irish annalists and synchronists agree in placing them about the beginning of the Christian era. And there cannot be any doubt as to the antiquity of the state of civilization disclosed in this great saga. It has been repeatedly pointed out that the Irish heroes are equipped and conduct themselves in the same manner as the Gauls described by the Greek traveller Posidonius, and Prof. W. Ridgeway has shown recently that several articles of dress and armour correspond exactly to the La Tène types of the continent. To mention a few primitive traits among many—the Irish champions of the Táin still fight in chariots, war-dogs are employed, whilst the heads of the slain are carried off in triumph and slung round the necks of the horses. It may also be mentioned that Emain Macha, Conchobar’s residence, is reported by the annalists to have been walled by the 18th century. Another point, which is stated to have been made into a separate province in the 2nd century A.D., are in the Táin regarded as forming part of Ulster. Noteworthy is the exalted position occupied by the druid in the Ulster sagas, showing how little the romances were influenced by Christianity. No Roman soldier ever set foot in Ireland, and this early epic literature is of supreme value as a monument of primitive Celtic civilization. Ireland has always been a pastoral country. In early times no native coins were in circulation: the land belonged to the tribe. Consequently a man’s property consisted mainly of cattle. Cattle-raids were an event of daily occurrence, and Sir Walter Scott has made us familiar with similar expeditions on the part of the Scottish Highlanders in the 18th century. Hence it is not a matter for surprise that the theme of the greatest Irish epic is a cattle-raid. At the time there were two wonderful bulls in Ireland, the Dond or Brown Bull of Cualnge, and the Findbennach or White-horn, belonging to Medb. These two animals are of no ordinary nature. Other stories represent them as having existed under many different forms before they were reborn as bulls. First they appear as swineherds. At the former period of the world the old is carried on in the sfd of fairy mounds; then they are metamorphosed successively as ravens, warriors, sea-monsters and insects. It was Queen Medb’s ambition to gain possession of the Brown Bull of Cualnge, and for this purpose she collected the united hosts of Ireland to raid the province of Ulster and carry him off. Medb chooses the season when she knows the Ulstermen are all incapacitated as the result of a curse laid upon them by a fairy woman. Cuchulain alone is exempt from this debility. The story is divided into a number of sections, and has been summarized by Miss Hull as follows:—(1) the prologue, relating, in the form of a night dialogue between Ailill and Medb, the dispute between them which brought about the raid; (2) the collecting of Medb’s hosts and the preliminary movements of the army, during which period she first became aware of the presence and powers of Cuchulain. Her inquiry of Fergus as to who this formidable foe is leads to a long section called (3) Cuchulinn’s boy-deeds, in which Fergus relates the remarkable prodigies of Cuchulinn’s youth, and warns Medb that, though the hero is but a beardless youth of seventeen, he will be more than a match for all her forces. (4) A long series of angular episodes of which the first part of the tale is made up; they are at first gay and bombastic in character, but become more grave as they proceed, and culminate in the combat of Cuchulinn with his old companion, Fer Diad. This section contains the account of Cuchulinn’s “distortion” or frenzy, which always occurred before any great output of the hero’s energy, and of the rout of the hosts of Medb which followed it. (5) The general awakening of the warriors of Ulster from their lethargy, and their gathering by sept Divs upon the Hill of Slane, clan by clan being described as it comes up in order. (6) The battle of Gairech and Ilaigere, followed by the rout of Medb’s army and (8) the tragic death of the bulls. The text of the Táin has come down to us as a whole or in part in nearly a score of MSS., most of which, however, are modern. The most important MSS. containing the story are U., LL. and YBL. Of these LL. and YBL are substantially the same, whilst LL. contains a longer and fuller text in both style and language. LL. attempts to give a complete and consistent narrative in more polished form. In ancient times there were doubtless other versions now lost, but from the middle of the 12th century the scribes seem to have taken few liberties with the text, whilst previously the lìd were constantly transforming the material and adding fresh matter. The YBL. version preserves a number of forms as old as the O. Ir. glosses (i.e. 8th century or earlier), and a curious story contained in LL. seems to point to the fact that the Táin was first committed to writing in the 7th century. Senchán Torpeist, who lived in the first half of the 7th century and succeeded Dallán Forgaill as chief ollamh of Ireland, summoned the lìd to inquire of them which knew the Táin in its entirety. As they were only familiar with fragments he despatched them to discover it. One of them located himself at the grave of Fergus MacRōg, who appeared to him in a dream and dictated the whole story to him in three days and three nights. At this point it will be well to say a few words about the form of the Táin. The old Irish epic is invariably in prose with poems of varying length interspersed. The narrative and descriptive portions are in prose and are frequently followed by a brief epitome in verse. Dialogues, eulogies and laments also appear in metrical form. The oldest poems, termed rhetoric, which are best represented in L., seem to be declamatory passages in rhetorical prose, not unlike the poetical passages in the Old Testament, and the original Táin may have consisted of such rhetoric bound together with short connecting pieces of prose. At a later date poems were inserted in the metres of the lìd (particularly the quatrains of four heptasyllabic lines) which Thurneysen and Windisch consider to have been developed out of medieval Latin verse. When in course of time the old rhetoric became unintelligible they were often omitted altogether or new poems substituted. Thus the LL. version contains a larger number of poems than the L.-YBL. copy, whilst L. preserves a number of homilies which do not appear in the later MS. The prose portions in L. are very much superior to those of YBL. These passages are abrupt, truncated and frequently obscure, with no striving after literary effect such as we find in LL. The form in which many episodes are cast is not unlike a mnemonic, leaving the story-teller to fill in the details himself. In the 11th century certain sections of the theme possessing great human interest were vastly extended, new poems were added, and in this manner such episodes come to form sagas complete in themselves. The most notable instance of this is the “Fight with Fer Diad,” which is not contained in L. The genesis of the Táin may thus be briefly summarized as follows. The story was first committed to writing in the 7th or 8th century, after which it was worked up by the lìd. Extended versions existing in the 10th or 11th century form the basis of the copies we now possess. Though the sagas of the Ulster cycle are eminently Irish and pagan in character and origin, it cannot be denied that traces of foreign influence are to be observed. A number of Latin and Norse loan-words occur in them, and there can be little doubt that the monkish scribes consciously thrust the supernatural elements into the background. However, although figures of Vikings are unmistakable in a few cases, and in one story Cuchulinn is made to fight with Hercules, such foreign elements can easily be detected in the older tales. They only affect minor details, and do not influence the body of the romances. From what we have already said it will be plain that the Irish epic is in a fluid state. The Táin is of interest in the history of literature as representing the preliminary stage through which the great verse epics of other nations had to pass, but its
value as a work of art is limited by its form. We must now say a few words about the character and style of these romances. As already stated, the atmosphere is frankly pagan and barbaric, with none of that courtly element which we find in the Arthurian epics. The two features which strike one most forcibly in the medieval Irish romances are dramatic force and humour. The unexpected and weird is always happening, the effect of which is considerably heightened by the grim nature of the actors. In particular the dialogues are remarkably brilliant and clever, and it is a matter for surprise that this gifted race never developed a drama of its own. This is doubtless partly due to the political conditions of the island. And, moreover, we are constantly struck by the lack of sustained effort which prevented the *fell* from producing great epics in verse. Dramatic material is abundantly present in the old epics, but it has never been utilized. As one might expect from the vernacular literature of Ireland, these romances are pervaded by a keen sense of humour. We feel that the story-teller is continually expecting a laugh and he exaggerates in true Irish fashion, so that the stories are full of extravagantly grotesque passages. In the later LL. version we notice a tendency to linger over pathetic situations, but this would unduly lengthen the story. The most serious defect of all Irish literary products is the lack of any sense of proportion, which naturally goes hand in hand with the love of the grotesque. Far too much attention is paid to trivial incidents and minute descriptions, however valuable the latter may be to the antiquarian, to the detriment of the artistic effect. Further, the story-teller does not know when to stop. He goes meandering on long after the main portion of the story is finished, with the result that Irish romances are apt to end in a most uninteresting anticlimax. Finally we are wearied with a constant repetition of the same epithets and similes, and with turgid descriptions, even the grotesque exaggerations pall when we find them to be stereotyped. But the early epics do not offend our sense of propriety in expression to the same extent as the later Finn cycle. The *Táin Bó Cuailnge* formed a kind of nucleus round which a number of other tales clustered. A number of these are called *remascul* or introductory stories to the *Táin*. Such are the "Reveling of the Táin" (already mentioned), the "Deblachain of the Ultonians" (giving the story of the curse), the "Cattle-Driving of Regamon, Dartaid and Fidlas", "Táin Bó Regamna", "The Cattle-Driving of Fruach", "The Dispute of the Swineherds", telling the previous history of the Bulls, "The Capture of the Fairy Mound", "The Dream of Mac Óc", the "Adventures of Nera", the "Wooing of Ferb". Other stories form a kind of continuation of the *Táin*. Thus the "Battle of Rosmore", ("Cath Ruis na Ríg") relates how Conchobar, as a result of the loss of the Bull, sends an army against the kings of Leinster and Tara, and would have been routed but for the prowess of Cúchulinn. The "Great Rout of the Plain of Murtherne" and "Cúchulinn's Death" tell how the hero's downfall is compassed by a monstrous brood of ill-shapen beings whose father and brothers had been slain by him during the *Táin*. He finally meets with his end at the hands of Lughaid, son of Cúr ó mac Daire (the central hero of a Munster cycle which has not come down to us), and Erc, king of Tara. We are also told of the terrible vengeance taken on the murderers by Conall Cernach. Other stories deal with the "Conception of Conchobar", the "Conception of Cúchulinn", "The Glories of Conchobar's Reign," with an account of how he acquired the Throne from Ferbas, "The Wooing of Emer and the Hero's Education in Scotland under Scathaí", "The Siege of Howth", "Bricriú's Feast and the Exile of the Sons of Dóel Daimri", "The Battle of the Boyne" (Ériú, vol. ii.), "The Deaths of Ailléll, Melbri and Conall Cernach", "Deforestation of Brú Dá Choca", "The Tragic Death of Conalch at the hands of Cúchulinn his father", "The Deaths of Goll and Garbh", "The Sickbed of Cúchulinn", in which the hero is lured away for a time into the invisible land by a fairy, Fand, wife of Manandán, "The Intoxication of the Ultonians", telling of a wild raid by night across the entire extent of the island from Dún da-Benh near Coleraine to the fort of Cúr ó MacDaire at Temair-Luachra in Kerry, "The Death of Conchobar", "The Phantom Chariot of Cúchulinn," in which the hero is brought up from the grave to witness before St. Patrick and King Loigaire the truth of the Christian doctrine.

Four other stories in connexion with the Ulster cycle remain to be mentioned. The first is "Scél muac Maiti Dathó" ("The Story of MacDatho's Fig"). Various writers of antiquity inform us that at the feasts of the Gauls the champion received the best portion of meat, which frequently led to brawls. In this savage but picturesque Irish story we find the Ulstermen vaunting their achievements against the Connaughtmen, until at last the contest lies between Conall Cernach and Cett MacMagach. Nowhere, perhaps, is the dramatic element better brought out. Apart from the *Táin* the greatest and at the same time the longest saga in which Cúchulinn figures is *Fled Briorend* (Bricriú's Feast). Bricriú is the mischievous-maker among the Ulstermen, and he conceives the idea of building a banquet hall in order to invite Conchobar and his nobles to a feast. After much hesitation they consent. Bricriú in turn incites the three chief heroes, Cúchulinn, Conall Cernach and Loigaire Buadach, to claim the champion's portion. He does the same thing with the spouses of these warriors; he induces the achievements and excellences of their several husbands into an imaginary saga entitled the "Women's War of Words." Loosely attached to this story follows a wild series of adventures in which the powers of the three champions are tested, Cúchulinn always proving his superiority. In order to decide the dispute, visits are paid to Medb at Rath Cruachan and to Cúr Ói in Kerry, and the story ends with the "beheading incident," which occurs in the romance of "Sir Gawayne and the Green Knight." *Fled Briorend* presents a number of textual difficulties. The text of the oldest MS. (LU.) shows signs of contamination, and several versions of the story seem to have been current. But the story of the Ulster cycle which is better known than any other, is the story of the "Tragical Death of the Sons of Usnech, or the Life and Death of Deirdre," one of the "Three Sorrows of Story-telling." This is the only tale of the group which has survived in the minds of the common people down to the present day. It is foretold to Deirdre, a girl-child of great beauty, that she will be the cause of great misfortunes, but Conchobar, having lost his wife, determines to have her brought up in solitude and marry her himself. However, the maiden chances to see a noble youth named Naisi, one of the three sons of Usnech, and persuades him to carry her off to Scotland, where they live for many years. At length they are induced to return after several of the most prominent Ulster warriors have gone bail for their safety. But Conchobar resorts to treachery, and the three sons of Usnech are slain, whilst the account of Deirdre's end varies. The oldest version of the story is found in LL., and the characters are as rugged and unsophisticated as those of the *Táin*. But in the later versions the savage features are toned down.

Before passing on, we must mention several old stories which are independent of the Ulster cycle, but which deal with events which are represented as having taken place before the Christian era. Few of the old romances deal directly with what we may call Irish mythology. The "Battle of Moytura" tells of the tremendous struggle between the Tuatha Dé Danann and their enemies, the Fomorian pirates. Connected with the events of this saga is the story of the "Tragic Deaths of the Sons of Tuireann," which, though mentioned in Cormac's glossary, is not found in any MS. older than the 18th century. The three sons of Tuireann have slain Cian, father of Lug Lammhada, who lays upon them a huge eric-fine. They go through terrific ordeals and accomplish their task, but return home to die. This is the second of the "Three Sorrows of Story-telling." An old story dealing with Tuatha Dé Danann personages, but having a certain bearing on the Cúchulinn cycle, is the "Courtship of Étán," who, though of supernatural (síd) birth, is wedded to Eochaid Airem, a mortal king. In her previous existence she was the wife of the supernatural personage Midir of Brí-leith, who wins back Étán from her mortal husband in a game of chess and carries her off to his fairy mound.

For sake of completeness we may add the titles of two other
well-known stories here. The one is the "Story of Baile the Sweet-spoken," which tells of the deaths of two lovers for grief at the false tidings of each other's death. The other is the "Fate of the Children of Lir," the third of the "Three Sorrows of Story-telling," which is only known in a modern dress. It relates how the four daughters of Lir (father of the sea-god Manandán and the original of Shakespeare's Lear) were changed into swans by a cruel stepmother, and how, after 900 years of wandering on the ocean, they at length regain their human form through the instrumentality of St Mochoamhóg.

A large number of sagas, which claim to be founded on historical events, present a great similarity to the tales of the Ulster cycle. Most of them are mentioned in the old catalogues. We can only name the more important here. The "Destruction of Dind-Rig and Exile of Labraíd Loingsc" relates how the kingdom of Leinster was snatched by one brother from another in the 6th century B.C. and how the son of the murdered prince, with the aid of a British force sacked Dind-Rig, the fortress of the usurper. The story of the visit of the pigeons to the court of Fergus MacLeite, king of Ulster in the 2nd century B.C., is only contained in a 17th-century MS. This tale is commonly stated to have been the idea on which Celis's "Historis Liripph," "Cathachim Chonghaíl Claringhcr," which only other modernized 17th-century version, deals with a revolution in the province of Ulster, supposed to have taken place before the Christian era.

The most important Old Irish saga after the Táin is beyond doubt the Destruction of Dá Derga's Hostel, contained in LU. It deals with events in the reign of the High-King Conaire Mór, who is said by the annalists to have been slain in 43 B.C. after a reign of seventy years. Conaire, who was a descendant of the Étán mentioned above, was a just ruler, and had banished among other lawless persons his own five foster brothers. These latter devoted themselves to piracy and made common cause with one Ingcel, a son of the king of Britain, who had been outlawed by his father. The high-king was returning from Col. Clare when he found the whole of Meath in flames. He turned aside into Leinster and made for Dá Derga's hostel. The pirates perceive this, and Ingcel is sent to spy out the hostel and discover the size of Conaire's force. This gives the storyteller a chance for one of those lengthy minute descriptions of natural objects which his style so much partakes of. Ingcel occupies one-half of the whole story. The pirates make their attack, and the king and most of his followers are butchered.

We can do no more than enumerate the titles of other historical tales: The "Destruction of the Hostel of MacDarro," describing the insurrection of the Aithch-Tuatha (1st century A.D.), "The Expulsion of the Déisi," and the "Battle of Mag Lema" (2nd century A.D.), "Battle of Mag Mucrime" (A.D. 195 or A.D. 218), "Siege of Drom Damascus" (3rd century), "Adventures of the Sons of Eochaid Muigmedón, father of Niall Nógiallicia" (4th century), "Death of Críthmunn" (reigned 366-378), "Death of Dathi" (d. 428), "Death of Murchertach, son of Erc," and "Death of Diarmait, son of Cerbál" (6th century) "Wooing of Beccoli, who became the wife of Diarmait, son of Aed Slane" (reigned 637-664), "Battle of Mag Rath" (657), "Battle of Carn Conaill" (c. 648), "Death of Maellothartaig MacRonain" (7th century), who was a kind of Irish Hippolytus, "Battle of Allen" (722).

It will be well to deal here with another class of story in its various stages of development. We have seen that the earlier romance is a closely associated with religion and supernatural beings. The latter are represented as either inhabiting the old mounds or as dwelling in islands out in the ocean, which are pictured as abodes of bliss and variously called Mag Mell (Plain of Delight), Tir na n-Oc (Land of Youth) and Tir Tairngire (Land of Promise). The visits of mortals to the Irish Elysium form the subject of three romances which we must now examine. The whole question has been exhaustively dealt with by Kuno Meyer and Alfred Nutt in the Voyage of Bran (London, 1805-1807). Condla Caem, son of Con Céchtachath, was one day scathed by his father on the hill of Usneh, when he saw a lady in strange attire approaching invisible to all but himself. She describes herself as coming from the "land of the living," a place of eternal delight, and invites the prince to return with her. Condla invokes the assistance of his druid to drive away the strange visitor, who in parting throws an apple to Condla. The young man partakes of no food save his apple, which does not diminish, and he is consumed with longing. At the end of a month the fairy-maiden again makes her appearance. Condla can hold out no longer. He jumps into the damsel's skiff of glass. They sail away and were seen no more. This is the Imram or Adventure of Condla Caem, the oldest text of which is found in LU. A similar story is entitled Imram Brain moic Feabhall, contained in YBL. and Rawlinson B 312 (the end also occurs in LU.), only with this difference that Bran, with twenty-seven companions, sets out to discover tir na n-Oc (the land of maidens). After spending some time there, one of his comrades is seized with home-sickness. They return, and the home-sick man, on being set ashore, immediately turns to dust. A later story preserved in BB., YBL, and the Book of Fermoy, tells of the visit of Cormac, grandson of Conn Céchtachath, to Tir Tairngir. These themes are also worked into tales belonging to the Ossianic cycle, and Finn and Ossian in later times become the typical warriors who go forth with their companions on these mysterious expeditions. The most just mentioned are almost entirely pagan in character, but a kindred class of story shows us how the old ideas were transformed under the influence of Christianity. A typical instance is Imram curaig Maelduin, contained in YBL, and in part in LU. Maelduin constructs a boat and sets out on a voyage with a large company to discover the murderer of his father. This forms the framework of the story. Numerous islands in the ocean are visited, each containing some great marvel. Imram na Corra (Book of Fermoy) and Imram Snédgșoa ocs Mac Rlaga (YBL) contain the same plan, but in this case the voyage is undertaken as an expiation for crime. In the 11th century an unknown monkish writer compiled the Navagido S. Brendani, drawing the material for his episodes from Imram curaig Mal- duin. This famous work only appears in an Irish dress in a confused and disconnected Life of St Brendan in the Book of Lismore. The same MS. contains yet another voyage, the "Adventure of Taid MacCéin."

We must now turn our attention to the later heroic cycle, commonly called the "Sagas of Ossian." Unfortunately the origin of the stories and their connexion with Finn and his warriors is obscure, and scholars are by no means agreed over the question (see Finn Mac Cool). In the earlier cycle the figures and the age in which they live are sharply drawn, and we can have no hesitation in assuming that the Táin represents the main state of Ireland at the beginning of the Christian era. Finn and his companions are nebulous personages, and, although it is difficult to discover the actual starting-point of the legend, from the 10th century onwards we are able to trace the development of the saga with some degree of certainty. A remarkably small amount of space is devoted to this cycle in the oldest MSS. Of the 134 pages contained in LU. only half-a-dozen deal with Finn as against 58 with Cúchulinn. In LL. the figures are, Ulster cycle 100 pp., Ossianic 25 pp., the latter being mainly made up of short ballads, whilst in 15th-century MSS., such as the Book of Lismore and Laud 510, the proportion is overwhelming in favour of the later group. Again in Urard MacCoisí's list of tales, which seems to go back to the 10th century, only two appear which belong to the Finn cycle. In the 12th century the first instance Finn seems to have been a poet, and as such he appears in the 12th-century MSS., LL. and LU. Thus the subjects of the Ossianic cycle in the earliest MSS. appear in a new dress. The vehicle of the older epic is prose, but the later cycle is clothed in ballad form. Of these ballads about a dozen, apart from poems in the Dindsenchus are preserved in LU., LL. and YBL., and none of these poems are probably much older than the 11th century. In the commentary to the Amra of Columbkille a beautiful poem on winter is attributed to Finn. At the same time we do find a few prose tales, e.g. "Folha colta"
Celt 629

**IRISH LITERATURE**

**Cnoc** "in LL., describing the death of Cumall, Finn’s father, and in LL. and Rawlinson B 502, part of which Zimmer assigns to the 7th century, we have the first story in which Finn actually occurs. But it is remarkable that in no case do tales belonging to the Finn cycle contain any of the old rhetorics which occur in the oldest of the Ulster romances. Already in LL., by the side of Finn, Ossian, Cálte and Fergus Finnbel are represented as poets, and the strain of lament over the griefs of the past, so characteristic a feature of the later developments of the legend, is already sounded. Hence by the 12th century the stories of the Fiann and their destruction at the battle of Gabra must have been fully developed, and from this time onward they appear gradually to have supplanted the Cuchulinn cycle in popular favour. Several reasons have been assigned for this. In the first place until the time of Brian Boróimhe the high-kings of Ireland had almost without exception been drawn from Ulster, and consequently the northern traditions were pre-eminent. This exclusiveness on the part of the north was largely broken down by the Viking invasions, and during the 11th century the leading poets were attached to the court of Brian and his descendants. In the manner an opposition was afforded to the Leinster–Munster Fenian cycle to develop into a national saga. John MacNeill has pointed out Finn’s connexion with a Firboig tribe, and maintains that the Fenian cycle was the property of the subject race. Zimmer has attempted to prove with great plausibility that Finn and his warriors were transformed on the model of the Ulster heroes. Thus one text deals with the boyish exploits of Finn in the manner of Cuchulinn’s youthful feats recorded in the Táin. And it is possible that the Siathach fac Conchulainn gave rise to the idea of connecting Ossian and Cálte with Patrick. As Cuchulinn was opposed to the whole of Ireland in the Táin, so Finn, representing Ireland, is pitted against the whole world in the Battle of Ventry.

We have already stated that the form assumed by the stories connected with Finn in the earliest MSS. is that of the ballad, and this continued down to the 18th century. But here again the Irish poets showed themselves incapable of rising from the ballad to the true epic in verse, and in the 14th century we find the poems written in the older cycle interspersed with verse again appearing. The oldest composition of any length which deals with the Ossianic legends is the Acallam na Senórach or Colloquy of the Old Men, which is mainly preserved in three 15th-century MSS., the Book of Lismore, Laud 610 and Rawlinson 487. In this text we have the framework common to so much of the later Ossianic literature. Ossian and Cálte are represented as surviving the battle of Gabra and as living on until the time of Patrick. The two warriors get on the best of terms with the saint, and Cálte is his constant companion on his journey through Ireland. Patrick inquires the significance of the names of the places they visit, and Cálte recounts his reminiscences. In this manner we are given nearly a hundred stories, the subjects of some of which occur in the short ballads in older MSS., whilst others appear later as independent tales. A careful comparison of the Acallam with the Cuchulinn stories, whether from the point of view of civilization or language or art, discloses that the first lengthy composition of the Ossianic cycle is but a feeble imitation of the older epic interspersed with verse again appearing. The prose romances sometimes contain beautiful snatches of verse, such as the descriptions of Mag Mell in Serglige Conculain, Tocharach Éitne, and the Voyage of Bran or the Lament of Cuchulinn over Fó Diad. Mention has also been made of the exquisite nature poems ascribed to Finn, which have been collected into a pamphlet with English renderings by Kuno Meyer (under the title of “Four Old Irish Songs of Summer and Winter,” London, 1903). The same writer points out that the ancient treatise on Irish prosody published by Thurneysen contains no less than 340 quotations from poems, very few of which have been preserved in their entirety. To Meyer we owe editions of two charming little texts which sufficiently illustrate the lyrical powers of the early poets. The one is a poem known as Finnbel and the other a similar poem between Guaire of Aide and his brother. The former is a collybog between Guaire of Aide and his brother Marban. The latter inquires of his brother why he prefers to live in a hut in the forest, keeping the herds and swine of the king, to dwelling in the king’s palace. The question calls forth so wonderful a description of the delights of nature as viewed from a shelter that Guaire exclaims, “I would give my glorious kingship to be in thy company, Marban” (King and Hermid, ed. with trans. by K. Meyer, London, 1901). Another text full of passionate emotion and tender regret ascribed to the 9th century tells of the parting of a young poet and poetess, who after parting their troth are separated for ever (Liadain and Curithid, ed. with trans. by K. Meyer, London, 1902). In the Old Woman of Beare (publ. K. Meyer in Ossianica) an old hetaira laments her departed youth, comparing her life to the ebbing of the tide (10th century).

Finn and Ossian. The latter has become the typical mouthpiece of the departed glory of the Fenian warriors, and Nutt has pointed out that there is a striking difference in spirit between the Acallam na Senórach and the 15th-century poems. In the latter Ossian is represented as a “pagan, defiant and reckless, full of contempt and scorn for the howling clerics and their churlish low-bred deity,” whilst Patrick is a sour and stupid fanatic, harping with wearisome monotony on the damnation of Finn and all his comrades. The earliest collection of these later Ossianic poems is that made in Scotland by James Macgregor, dean of Lismore, early in the 16th century. Another miscellany is the Duonaire Finn, a MS. in the Franciscan monastery in Dublin, compiled from earlier MSS. in 1627. This “song-book,” which has been edited for the Irish Texts Society by John MacNeill (part 1, 1908), contains no less than sixty-nine Ossianic ballads, amounting in all to some ten thousand lines. Other Ossianic poems of dates varying from the 13th to the 18th century have been published in the Transactions of the Ossianic Society (Dublin, 1854–1861), including amongst others “The Battle of Gabra,” “Lamentation of Ossin (Ossian)” after the Finnbel and “Dialogue between Ossin and Patrick,” “The Battle of Oisin, the Drum or the Drum of the Drum,” and “The Chase of Slabh Guileana.” These ballads still survive amongst the peasants at the present day. We further possess a number of prose romances, which in their present form date from the 16th to the 18th century; e.g., The Pursuit of Diarmuid and Gráinne, Finn and Gráinne, Death of Finn, The Clown in the Drab Coat, Pursuit of the Gillia Decair, The Enchanted Fort of the Quickeneer, The Enchanted Cave of Ceis Cerann, The Feast in the House of Conon.

At the present moment it is impossible to give a complete survey of the other branches of medieval Irish literature. The attention of scholars has been largely devoted to the publication of the sagas and the neglect of other portions of the wide field. An excellent survey of the subject is given by K. Meyer, Die Kultur des Gegenwart, i. xi. i. pp. 78–95 (Berlin-Leipzig, 1909).

We have already pointed out that as early as the Old Irish period nameless Irish poets were singing the praises of nature in a strain which sounds to our ears peculiarly modern. At the present time it is difficult to say how much of what is really poetical in Irish literature has come down to us. Our MSS. preserve whole reams of the learned productions of the fáidh which were so much prized in medieval Ireland, but it is generally speaking, quite an accident if any of the delightful little lyrics entered in the margins or on blank spaces in the MSS. have remained. The prose romances sometimes contain beautiful snatches of verse, such as the descriptions of Mag Mell in Serglige Conculain, Tocharach Éitne, and the Voyage of Bran or the Lament of Cuchulinn over Fó Diad. Mention has also been made of the exquisite nature poems ascribed to Finn, which have been collected into a pamphlet with English renderings by Kuno Meyer (under the title of “Four Old Irish Songs of Summer and Winter,” London, 1903). The same writer points out that the ancient treatise on Irish prosody published by Thurneysen contains no less than 340 quotations from poems, very few of which have been preserved in their entirety. To Meyer we owe editions of two charming little texts which sufficiently illustrate the lyrical powers of the early poets. The one is a poem known as Finnból and the other a similar poem between Guaire of Aide and his brother Marban. The latter inquires of his brother why he prefers to live in a hut in the forest, keeping the herds and swine of the king, to dwelling in the king’s palace. The question calls forth so wonderful a description of the delights of nature as viewed from a shelter that Guaire exclaims, “I would give my glorious kingship to be in thy company, Marban” (King and Hermid, ed. with trans. by K. Meyer, London, 1901). Another text full of passionate emotion and tender regret ascribed to the 9th century tells of the parting of a young poet and poetess, who after parting their troth are separated for ever (Liadain and Curithid, ed. with trans. by K. Meyer, London, 1902). In the Old Woman of Beare (publ. K. Meyer in Ossianica) an old hetaira laments her departed youth, comparing her life to the ebbing of the tide (10th century).
We must now step aside from pure literature and turn our attention to the various productions of the professional learned classes of Ireland during the middle ages. The range of subjects coming under this heading is a very wide one, comprising history, genealogies, hagiology, topography, grammar, lexicography and metre, law and medicine. It will perhaps be as well first of all to deal with the learned *fidil* whose works have been preserved. Irish tradition preserves the names of a number of antiquarian poets of prehistoric or early medieval times, such as Amergin, one of the Milesian band of invaders; Moran Roinside, son of Sigair Mór, Adna and his successor Ferceirnt, Torna (c. 1000), tutor to Niall Nóigiallach, Dallán Forgaill, Sénchan Torpést, and Cennfaelad (d. 678), but the poems attributed to these writers are of much later date. We can only enumerate the chief of whose works have been preserved. To Maeldur (d. 887) is attributed a poem on the Milesian migrations. About the same time lived Flannan, son of Cellach, who wrote a long composition on the deaths of the kings of Ireland, preserved in YBL, and Flann MacLonain (d. 918), called by the Four Masters the Virgil of Ireland, eight of whose poems are attributed to him in all about 1000 copies. Cormacan, son of Maellbridge (d. 946), composed a vigorous poem on the circuit of Ireland performed by Muirchertach, son of Niall Glúndub. A poet whose poems are most valuable from an antiquarian point of view is Cinaed Ua h-Artacáin (d. 975). Some 800 lines of his have been preserved in LL. and elsewhere. Contemporary with him is Eochaid O'Flainn (d. c. 1003), whose chief work is a long chronological poem giving a list of the kings of Ulster from Cimbetha down to the destruction of Emain in 332. A little later comes MacLiach (d. 1016), who celebrated in verse the glories of the reign of Brian Boroime. His best-known work is a lament over the palace of Brian. Contemporary with MacLiach is MacGilla Coim Leachlaín in 1024. To Cúan ua Lochtháin (d. 1024), chief poet in the reign of Maelsheachlainn II., are ascribed poems on the antiquities of Tara. Sixteen hundred lines of his have come down to us. A writer who enjoyed a tremendous reputation in medieval Ireland was Flann Mainstrech (d. 1056), who in spite of his being a layman was head of the monastery school at Monasterboice. He is the author of no fewer than 2000 lines in LL., and many other poems of his are contained in other MSS. His best-known work is a *Book of Synchroinonos* of the kings of Ireland and those of the ancient world. We have also poems from his pen on the monarchs descended from Niall Nóigiallach and on the chronology of the high-kings and provincial kings from the time of Loighaire. Flann's successor, Gilla Coemgin (d. 1072), gives us a chronological poem dealing with the annals of the world down to A.D. 1014. He also is the author of the Irish version of Nennius which contains substantial additional deals dealing with early Ireland. Minor writers of the same nature whose works have come down to us are Colmán O'Sesnáin (d. 1050), Néide ua Maelchonaire (d. 1136), Gilla na nAin uDuin (d. 1160), Gilla Moduda O'Cassidy (1143). In the 13th century these historical poems become very rare. In the next century we again find antiquarian poets of whom the best-known is John O'Dugan (d. 1372). His most valuable composition treats of the tribes of the northern half of Ireland at the time of the northern conquest. This work, containing 1660 lines in all in debide metre, was completed by his younger contemporary Gilla na nAmhain (d. 1418). From the time of this poet the historic poets began to give way to the hereditary bards and families of scribes. Among the chief bardic families we may mention, the O'Dalys, the MacWards, the O'Higgins, the MacBrodys and the MacDaires. We must here content ourselves with glancing at a few of the more prominent names. Muireadhach Albanach (c. 1214-1240), whose real name was O'Daly, has left behind in addition to the religious verses a considerable number of poems in praise of various patrons in Ireland and Scotland. He is said by Skene to be the first of the MacCuivrichus, bards to Macdonald of Clanranald. A number of his compositions are preserved in the Book of the Dean of Lismore. Gilla Bríd MacConmidhe was a contemporary of the last-mentioned bard. He wrote a number of poems in praise of the O'Neill's and O'Donnells. We may next mention the name of an abbot of Boyle, Donnchad Mór O'Dáláig (d. 1244), a writer whose extant poems are usually of a religious character. Many of them are addressed to the Virgin. Most of them appear in late MSS., but some few are preserved in the Book of the Hy Maine. Donnchad Mór is said to be the greatest religious poet that Ireland has produced. Many other members of the O'Daly family belonging to the 14th and 15th centuries have left poems behind them, but we cannot mention them here. Angus O'Daly, who lived in the second half of the 16th century, was employed by the English to satirize the chief Gaelic families in Ireland. Two members of the O'Higgin family deserve mention, Tadg mór O'Higgin (d. 1315), and Tadg Óg O'Higgin (d. 1448), a voluminous writer who eulogized the O'Neills, O'Connors and O'Kells. Tadg Óg also composed a number of religious poems, which enjoyed enormous popularity in both Ireland and Scotland. A *duonaire* was inserted into YBL., which contains some forty poems by him.

Closely connected with the compositions of the official poets are the works of native topography. Most of the sagas contain a number of explanations of the origins of place-names. The *Dindsenchus* is a compilation of such etymologies. But its chief value consists in the amount of legendary matter it contains, added in support of the etymologies given. The *Dindsenchus* has come down to us in various forms both in prose and in verse. Irish tradition ascribes it to Amergin MacAmalgaid, who lived in the 6th century, but if the kernel of the work goes back as early as this it must have been altered considerably in the course of the centuries. Both prose and verse forms of it are contained in LL. A kindred compilation is the *Céith Annmann* (Fitness of Names), which does for personal names what the *Dindsenchus* does for geographical names. We further possess a versified compendium of geography for educational purposes dealing with the three continents, from the pen of Airtbertach MacCose-dobhrán (10th century).

No people on the face of the globe have ever been more keenly interested in the past of their native country than the Irish. This will already have been patent from the compositions of the *fidil*, and now we may describe briefly the historical works in prose which have come down to us. The matter may be divided into two classes, (1) works containing a connected narrative, (2) annals. Closely allied to these are the sagas dealing with the high-kings. Even in the serious historical compositions we often find the manner of the sagas imitated, e.g. the supernatural plays a prominent part, and we are treated to the same exaggerated descriptions. The earliest of these histories is the *Wars of the Gael and Gall* (*Cogad Gaedel re Gallaibh*), which gives an account of the Viking invasions of Ireland, the career of Brian Boroime and the overthrow of the Norsemen at the battle of Clontarf. This composition, a portion of which is contained in LL., is often supposed to be in part the work of MacLiach, and it is plain from internal evidence that it must have been written by an eye-witness of the battle, or from materials supplied by a person actually present. Numerous shorter tracts dealing with the same period exist, but as yet few of them have been published. *Cathairim Cellachtha Caisil* treats of the conflicts between the Vikings and the Irish, and the *Leabhar Oirs* gives an account of Irish history from 997 to 1027. Compilations relating to local history are the *Book of Fenagh* and the *Book of MacCarthar* in which but one work is also preserved in LL. is the Book of Invasions (*Leabhar Gabhála*). This deals with the five prehistoric invasions of Ireland (see Ireland: Early History) and the legendary history of the Milesians. The most complete copy of the *Leabhar Gabhála* which has been preserved was compiled by Michael ÓClercy about 1630. The *Boroma or History of the Leinster Tribute* contained in LL. belongs rather to romance. Another history is the *Triumphs of Turlough O'Brian*, written about the year 1450 by John MacCrith, a Munster historian (edited by S. H. O'Grady, Camb. Press). This inflated composition is an important source of information on Munster history from the landing of the Normans to the middle of the 14th century. We also possess
several documents in Irish concerning the doings of the O'Neills and O'Donnells at the close of the 16th century. A life of Hugh Roe O'Donnell, by Lughaidh O'Clyery, has been published, and a contemporary history of the Flight of the Earls, by Tadhg O'Cian, was being prepared in 1608. But the most celebrated Irish historian is certainly Geoffrey Keating (c. 1570-1646), who is at the same time the greatest master of Irish prose. Keating was a Munster priest educated in France, who drew down upon himself the displeasure of the English authorities and had to go into hiding. He travelled up and down Ireland examining all the ancient records, and compiled a history of Ireland down to the Norman Conquest. His work, entitled Forus Peasa ar Eirinn, was never published, but it circulated from end to end of Ireland in MS. Keating's history is anything but critical. Its value for the scholar lies in the fact that the author had access to many important sources of information now lost, and has preserved accounts of events independent of and differing from those contained in the Four Masters. In addition to the history and a number of poems, Keating is also the author of two theological works in Irish, the Defence of the Mass (Eochairsgiath an Airfrin) and a collection of sermons entitled Three Shafts of Death (Tri brithfeatain an Bhithi), which are models of Irish prose.

From the writers of historical narrative we turn to the annalists, the most important sources of information with regard to Irish history. We have already mentioned the Synchronisms of Flann Mainistrech. Apart from this work the earliest collection of annals which has come down to us is the compilation by Tighernach O'Braelin (d. 1088), abbot of Clonmacnoise. Tighernach, whose work is partly in Latin, partly in Irish, states that all Irish history previous to 305 B.C. is uncertain. No perfect copy is known of this work, but several fragments are in existence. The Annals of Innisfallen (a monastery on an island in the Lower Lake of Killarney), which are also in Latin and Irish, were perhaps compiled about 1215, though they may have begun two centuries earlier. The invaluable Annals of Ulster were compiled on Belle Isle on Upper Lough Erne by Cathal Maguire (d. 1498), and afterwards continued by two different writers down to 1604. This work, which deals with Irish affairs from A.D. 431, exists in several copies. The Annals of Loch Cé (near Boyle in Roscommon) were copied in 1588 and deal with Irish events from 1014 to 1646. The Cionainn Scotorum, one copy of which was transcribed about 1650 by the famous antiquary Duasd MacFirbis, deals with Irish affairs down to 1135. The Annals of Boyle extend down to 1531. The Annals of Clonmacnoise, which come down to 1408, only exist in an English translation made by Connell MacGoghegan in 1627. The most important of all these collections is the Annals of the Four Masters (so christened by Colgan), compiled in the Franciscan monastery of Donegal by Michael, Conary and Cucogy O'Clyery and Fercusa O'Mulconry. The O'Clyerys were for a long period the hereditary ollams to the O'Donnells. Michael O'Clyery (1575-1643), the greatest of the four, was a lay brother in the order of St Francis, and devoted his whole life to the history of Ireland. He collected all the historical MSS. he could find, and was encouraged in his undertaking by Pergal O'Gara, prince of Coolavon, who paid all expenses. The great work, which was begun in 1624 and finished in 1636, begins with the arrival in Ireland of Cessair, granddaughter of Noah, and comes down to 1616. Nearly all the materials from which O'Clyery drew his statements are now lost. O'Clyery is also the author of a catalogue of the kings of Ireland, the genealogies of the Irish saints, and the Martyrology of Donegal and the Book of Invasions.

Of less interest, but every whit as important, are the lists of genealogies which occupy a great deal of space in LL., YBL. and BB., and two Trinity College, Dublin, MSS. (H. 3. 18 and H. 2. 4). But by far the most important collection of all is that made by the last great shanachie Duasd MacFirbis, compiled between 1650 and 1666 in the college of St Nicholas at Galway. The only portions of any considerable length which have as yet been published deal with two Connaught tribes, viz. the Hy Fiachrach from Duasd mac Firbis and the Hy Maine (O'Kellys), and a Munster tribe, the Corcalaidhe, both from YBL. Valuable information with regard to early Irish history is often contained in the genealogies or, as they are sometimes termed, Bóth (ruptures, visions), a notable example of which is Baile in Scol (Vision of the Phantom).

When we turn from secular to religious themes we find that Ireland is also possessed of a very extensive Christian literature, which is extremely valuable for the comparative study of medieval literature. Apart from the martyrologies already mentioned in connexion with Oengus the Culdee, a number of lives of saints and other ecclesiastical literature have come down to us. One of the most important documents is the Tripartite Life of St Patrick, which cannot very well have been composed before the 10th or 11th century, as it is full of the extravagant miracles which occur in the later lives of saints. The work consists of three separate homilies, each complete in itself. A later version of the Tripartite Life was printed by Colgan in 1647. The Leabhar Breac contains a quantity of religious tracts, most of which have been published. R. Atkinson issued a number of them under the title of Passions and Homilies from Leabhar Breac (Dublin, 1887). These are not original Irish compositions, but translations from Latin lives of saints.

Nor do they deal with the lives of any Irish saints. Stokes has published nine lives of Irish saints from the Book of Lismore, including Patrick, Brigid, Columba, Brendan, Findian (Clonard), Ciaran, Senan, Finichua and Mochua. They are written in the form of homilies preceded by short explanations of a text of scripture. These lives also occur in the Leabhar Breac. Other lives of saints have been published by O'Grady in Sitha Gadelica. The longest life of St Columba was compiled in 1536 at the command of Manus O'Donnell. This tedious work is a specimen of hagiology at its worst. The Leabhar Breac further contains a number of legends, such as those on the childhood of Christ, and scattered through many MSS. are short anecdotes of saints which are very instructive.

But the most interesting Irish religious text is the Vision of Adamnan (preserved in U.), which Stokes assigns to the 11th century. The soul of Adamnan is represented as leaving his body for a space to visit heaven and hell under the conduct of an angel. The whole treatment of the theme challenges comparison with Duns Scotus' great poem, but the Irish composition contains many ideas peculiar to the land of its origin. Later specimens of this kind of literature tend to develop into grotesque buffoonery. We may mention the Vision of Pures, the Vision of Tundale (Trudgal), published by V. Friedel and K. Meyer (Paris, 1907), Laisren's Vision of Hell and the Vision of Merlin. A further vision attributed to Adamnan contains a stern denunciation of the Irish of the 11th century. Another form of religious composition, which was very popular in medieval Ireland, was the prophecy in verse, but scarcely any specimens have as yet been published. Kuno Meyer edited a tract on the Psalter in his Hibernica Minor from a 15th century Oxford MS., but he holds that the text goes back to 750. A number of collections of monastic rules both in prose and verse have been edited in Erin, and the MSS. contain numerous prayers, litanies and religious poems.

In U. are preserved two sermons, Seola na eserti (Tidings of Resurrection) and Seola i d'Ith britha (Tidings of Doomsday); and a number of other homilies have been published, such as the Two Sorrows of the Kingdom of Heaven,” “The Penance of Adam,” the “Ever-new Tongue,” and one on “Mortal’s Sins.” All the homilies contained in LB. have been published by R. Atkinson in his Legends and Homilies from Leabhar Breac (Dublin, 1887), and E. Hogan, The Irish Nennius (Dublin, 1895). The popular “Debate of the Body and the Soul” appears in Ireland in the form of a homily. A collection of maxims and a short moral treatise have been published by K. Meyer.

For the religious literature in general the reader may refer to O'Curry, Lectures on the M.S. Materials of Ancient Irish History (pp. 339-434), and G. Dottin, “Notes bibliographiques sur l'ancienne litterature christienne de l'Irlande,” in Revue d'histoire et de litterature religieuses, v. 162-167. See also Rene celeste, xi, 391-404. - T. v. 79-91.
Here we may perhaps mention an extraordinary production entitled *Aifiling Meic Congninne*, the Vision of Mac Conglinne, found in LB. and ascribed to the twelfth century (ed. K. Meyer, London, 1892). Cathal MacFinguine, king of Munster (d. 737), was possessed by a demon of gluttony and is cured by the recital of a strange vision by a vagrant scholar named MacConglinne. The composition seems to be intended as a satire on the monks, and in particular as a travesty of medieval hagiography. Another famous satire, entitled the Proceedings of the Great Bardic Institution, holds up the professional bards and their exortative methods to ridicule. This curious work contains the story of how the great epic, the *Tain bo Cuailnge*, was recovered (see *Transactions of the Ossianic Society*, vol. v.).

Collections of pithy sayings in the form of proverbs and maxims must have been made at a very early period. Not the least remarkable are the so-called Triads (publ. K. Meyer, Dublin, 1906), which illustrate every statement with 3 examples. Over 200 such triads were brought together in the 9th century. There are also two documents attributed to 1st-century personages, “The Testament of Morann MacMoín to his son Feradach,” which is quoted as early as the 5th century, and *Sceladus in manu* (ed. J. S. McDowall), from which the instructions of the foster-son Luidag. “K. Meyer has published *Terosca cormaic* or the Precepts of Cormac MacArt to his son Cairpre (Dublin, 1909). Other collections such as the *Senhíothra Filhai* still await publication.

With that enthusiasm for the classics which is characteristic of the Irish, it is not strange that we should find medieval versions of some of the better-known authors of antiquity. It is interesting to note that only those works are translated that could be utilized by the professional story-teller. So much so, that in the ancient (10th century) catalogue of sagas enumerated by Urard MacCosír we find mention of *Togail Troi* and *Scéla Alexandir maic Pilip*. We get descriptions of battle weapons and clothing similar to those occurring in the native sagas. *Togail Troi* is taken from the medieval prose version, *Historia de Excitio Troiae of Dares Phrygius*. The oldest Irish copy is found in LL. This version is exceedingly valuable, as it enables us to determine the meaning of words and formulae in the sagas which are otherwise obscure. An Irish abstract of the *Odyssey*, following an unknown source, and part of the story of *Theseus* have been published by K. Meyer, *Scéla Alexandir* is preserved in LB. and BB. *Imhechta Aeniusa*, taken from the *Aenid*, is contained in BB. A number of MSS. contain the Cath Catharda, a version of books vi. and vii. (?) of Lucian’s *Pharsalia*, which has been published by W. Stokes. There is further at least one MS. containing a version of Statius’s *Thebaid* and of Heliodorus’s *Aethiopica*. Somewhat later, the medieval literature of western Europe comes to be represented in translations. Thus we have Irish versions, amongst others of the *Gesta Romana*, the *Historia Brittonum*, the Wars of Charlemagne, the History of the Lombards, Sir John Maundeville’s Travels (trans. by Fingin O’Mahony in 1475), the Book of Ser Marco Polo (abridged), Guy Earl of Warwick, Bevis of Southampton, the Quest of the Holy Grail, Octavian, the chronicle of Turpin, Barlaam and Josaphat, and the story of Fierabras. The Arthurian cycle is developed in independent fashion in the Adventures of the Eagle Boy and the Adventures of the Crop-eared Dog. For translation literature see M. Nettlau, *Revue Celtique*, x. pp. 134, 460-466.

Hand in hand with the translation of the medieval Irish scholars in the history of their island goes the cultivation of the native Philology. Owing to the profound changes produced by the working of the Irish laws of accent and initial mutation, it is doubtful if any other language lends itself so well to wild etymological speculation. By the beginning of the Middle Irish period a good part of the cumbrous Old Irish verb-system had become obsolete, and texts which were at all faithfully copied had to be plentifully supplied with glosses. Moreover, if, as is probable, all the historical and legal lore was in verse, a large part of it must have been unintelligible except to those who knew the *bèfè fèn*. But even before this Cormac mac

Cúilinnáin, the bishop-king of Cashel (d. 903), had compiled a glossary of archaic words which are accompanied by explanations, etymologies, and illustrative passages containing an amount of invaluable information concerning folk-lore and legendary history. This glossary has come down to us in various recensions all considerably later in date than the original work (the oldest copy is in LB.). Later collections of archaic words are O’Mulconry’s Glossary (13th century), the *Lecan Glossary* (15th century), which draws principally from the glosses in the *Liber Hymnorum*, O’Davoren’s *Glossary* (16th century), drawn principally from the Brehon Laws, a 16th century list of Latin and Irish names of plants employed in medicine, and O’Clery’s *Glossary* (published at Louvain, 1643). BB. contains a curious tract on Ogam writing. An Irish treatise on grammar, called *Uraicept na n-ées*, the Poet’s Primer, traditionally ascribed to Cennfaealad and others, is contained in BB. and YBL. It appears to be a kind of medley of Donatus and the notions of the medieval Irish concerning the origin of their language. The St Gall glosses on Priscian contain Irish terms for all the nomenclature of the Latin grammarians, and show how extensive was the use made of Irish even in this department of learning.

Thurneysen had edited from BB., Laur. 1560 and a TCD. MS. the variations on metrical and accounted for the number of the countless metres practised by the *fílíd*. It is impossible for us here to enter into the question of Irish prosody in any great detail. We have seen that there is some reason for believing that the primitive form of Irish verse was a kind of rhythmical alliterative prose as contained in the oldest versions of the sagas. The *fílíd* early became acquainted with the metres of the Latin church hymns, whence rhyme was introduced into Ireland. (This is the view of Thurneysen and Windisch. Others like Zeuss have maintained that rhyme was an invention of the Irish.) In any case the *fílíd* evolved an intricate system of rhymes for which it is difficult to find a parallel. The medieval metres are called by the general name of *Déan Direch*, “Direct Metre.” Some of the more general principles were as follows. The verses are grouped in stanzas of four lines, each stanza being complete in itself. Each line must contain a fixed number of syllables, whilst the different metres vary as to the employment of internal and end rhyme, assonance and alliteration. The Irish elaborated a peculiar system of consonantal correspondence which counted as one rhyme every consonant in the line, and the degree of phonetic accuracy into six groups, so that a voiceless stop (c) rhymes with another voiceless stop (t, p), a voiced stop (b) with another voiced stop (d, g), and so forth. The commonest form of verse is the four-line stanza of seven syllables. Such a verse with rhymes abab and monosyllabic or dissyllabic finals belongs to the class *rannagacht*. A similar stanza with *aabb* rhymes is the basis of the so-called *debide* (cut in two) metres. A peculiarity of the latter is that the rhyming word ending the second line must contain at least one syllable more than the rhyming word which ends the first. Another frequently employed metre is the *rindard*, consisting of lines of six syllables with dissyllabic endings. In the metrical treatises examples are given of some 200 odd metres. The result of the complicated technique evolved in Ireland was an inclination to sacrifice sense to musical harmony. See K. Meyer, *A Primer of Irish Metrics* (Dublin, 1909).

We can conclude this survey of medieval Irish literature by mentioning briefly two departments of learning to which much attention was paid in Ireland. These are law and medicine. The so-called *Brehon Laws*, as they are represented as having been codified and committed to writing in the time of St. Patrick. There is doubtless some grain of truth in this statement, as a *filipp* may have been given to this codification by the publication of the Theodosian Code, which was speedily followed by the codes of the various Teutonic tribes. The Brehon Laws were no doubt originally transmitted from teacher to pupil in the form of verse, and traces of this are to be found in the texts which have been preserved. But the Laws as we have them do not go back to the 5th century. In our texts isolated phrases or portions of phrases are given with a commentary, and this commentary is further explained by some
The intricate classical measures gradually broke down. Dr Douglas Hyde gives it as his opinion that the exceedingly numerous metres known in Middle Irish had become restricted to a couple of dozen, and these nearly all heptasyllabic. Nevertheless they continued to be employed till into the 18th century. However, during the 17th century we find a new school arising with new principles and new methods. These consisted in (1) the adoption of vowel rhyme in place of consonantal rhyme, (2) the adoption of a certain number of accents in each line in place of a certain number of syllables. Thus, according to what we have just said, the accented syllables in a line with four accents in one line will fall on, say, the following vowels e,u,e, and the line rhyming with it will have the same sounds in the same or a different sequence. (For English imitations see Hyde, A Literary History of Ireland, pp. 548 ff.)

The consequences of the changed political conditions were of the greatest importance. The bards, having lost their patrons in the general upheaval, threw themselves upon the old classical metres and turned to the general public. At the same time they had to abandon the countless chevilles and other characteristics of the old bardic language, which were only understood by the privileged few. But to compensate for this much more freedom of expression and naturalness were possible for the first time in Irish verse. The new metres made their appearance in Ireland about 1600, and the learned Keating himself was one of the first to discard the ancient prosody. During the latter half of the 17th century and throughout the 18th century the body of verse produced in Ireland voices the sorrows and aspirations of the whole nation, and the literary activity in almost every county was correspondingly great. It is only during the last few years that the works of any of the poets of this period have been published. Pierce Ferriter was the last chieftain who held out against Cromwell's army, and he was hanged in 1653. His poems have been edited by P. S. Dinneen (Dublin, 1903). The bard of the Williamite wars was David O'Brada (d. 1697-1698). From this period date three powerful satires on the state of affairs in Munster, and in particular on the Cromwellian settlers. They are of coarse and savage nature, for which reason they have never been printed. Their titles are the Parliament of Clan Thomas, the Adventures of Clan Thomas, and the Adventures of Tadhg Dubh (by Egan O'Rahilly). A description of the parliament of Clan Thomas is given by Stern in the Zeitschr.f. Celt. Phil. v. p. 541 ff.

A little later we come across a band of Jacobite poets. The gallant figure of Charles Edward was so popular with Irish bards that a conventional stereotyped form arose in which the poet represents himself as wandering in a wood and meeting a beautiful lady. We are treated to a full description of all her charms, and the poet compares her to all the fair heroines of antiquity. But she replies that she is none of these. She is Erin seeking refuge from the insults of foreign suitors and looking for her mate. The idea of such poems is a beautiful one, but they become tedious when one has read a dozen of them only to find that there are scores of others in exactly the same strain. Besides the Visions (Aisling), as they are termed, there are several noteworthy war-songs, whilst other poems are valuable as giving a picture of the state of the country at the time. We can do no more than mention the names of John O'Neaghtan (d. 1720; edition of his poems by A. O'Farrelly, Dublin, 1908), Egan O'Rahilly, who flourished between 1700 and 1726; Tadhg O'Naughten, Andrew MacCurtin (d. 1479), Hugh MacCurtin, author of a grammar and part editor of O'Beigley's Dictionary; John Clarach MacDonnell (1691-1754), John O'Tuomy (d. 1775), Andrew Magrathe, Tadhg Gaoch O'Sullivan (d. 1795), author of a well-known volume of religious poems, a valuable source of information for the Munster dialect; and Owen Roe O'Sullivan (d. 1784), the cleverest of the Jacobite poets (his verses and bons mots are still well known in Munster). These poets hailed mostly from the south, and it is chiefly the works of the Munster poets that have been preserved. Ulster and Connaught also produced a number of writers, but very little beyond the mere names has been preserved except in the case of the Connaught poet Raftery.
of the Iliad into Irish. It is only within recent years that attention has been paid to the collection of folk-songs and tales in Irish, although as long ago as 1853 Crofton Croker published three volumes of folklore from the south of Ireland which attracted the attention of Sir Walter Scott, who was to do the classic stories of Carleton fall within our province. We may mention among others Patrick O'Leary's Sgéalaidheacht Chuaigh Mumhan (Dublin, 1895); Hyde's Beside the Fire (London, 1890) and An Sgéalide Gaedhealach, reprinted from vol. x. of the Annales de Bretagne (London, 1901); Daniel O'Fogharta's Stíamsa an Gheimhridh (Dublin, 1882); J. Lloyd's Sgéalide Ógíghtail (Dublin, 1905); and Larminie's West Irish Folk-Tales (London, 1893). The most important collections of folk-songs are Love-Songs of Connaught (Dublin, 1893) and Religious Songs of Connaught (Dublin, 1906), both edited by Hyde. The most extensive collection of proverbs is the one entitled Sheasfhocla Uladh by Henry Morris (Dublin, 1907).

AUTHORITIES.—In the absence of a comprehensive history, the best manual is Eleanor Hall's A Book of Irish Literature (2 parts, London, 1904-1908; vol. 2 contains a bibliographical appendix). D. Hyde's larger History of Irish Literature (London, 1899) is only trustworthily as regards the more modern period. A full bibliography of O'Mulloy's Deutsches Iliad (1845) is best known by G. Dottin's article "La littérature gauloise de l'Irlande" (Revue de l'histoire littéraire de la Gaule, vol. iii. pp. 1 fl.). Dottin's article has been translated into English and supplemented by Joseph Dunn under the title of The Gaelic Poetry of Ireland (Washington, 1906, privately printed). The following is an important article by S. H. Stern, "Thesaurus Palaeohibernicus" (2 vols., Cambridge, 1901-1903): H. Bernand and R. Atkinson, Liber Hymnorum (London, 1895); E. O'Curry, Lectures on the M.S. Materials of Ancient Irish History (Dublin, 1878 and 1879); F. O'Driscoll, Catalogue of Irish MSS. in the British Museum (2 vols., Dublin, 1891); W. Ferriter, Notes on the Étude de la littérature celtique (Paris, 1883), Essai d'un catalogue de la littérature épique de l'Irlande (Paris, 1883); L'Épopée celtique en Irlande (Paris, 1882), La Civilisation des Céls et celle de l'épopée hibernique (Paris, 1895); E. Windisch, Tírin Bó Cuinne, ed. with an intro. and German trans. (Leipzig, 1905); L. Winfried, De l'Iliad de l'Irlande (Dublin, 1904); the Irish text according to L.U. and Y.B.L. has been published as a supplement to Erinn; Eleanor Hull, The Cuchulain Saga (London, 1899); W. Ridgeway, "The Date of the Iliad," Publications of the British Academy, vol. ii. (London, 1907); A. Nutt, Cuchulain, the Irish Achilles (London, 1899); H. Zimmer, "Keltische Beiträge" in Zeitschrift f. deutsches Altertum, vols. 32, 33 and 35; and "Über die Keltologie der Franzosen," in the Bulletin de correspondance hellénique, 1908, xxvii. pp. 237-29. The series ofIrish Texts, vols. i.-iv. (Leipzig, 1880-1901), by E. Windisch (vols. ii.-iv. in conjunction with W. Stokes), contains a number of important texts. Others, more particularly belonging to the Osiansian cycle, are to be found in S. H. O'Grady's Silva Gadelica (2 vols. London, 1893). See also R. Thurneysen, Sagen aus dem alten Irland (Berlin, 1901); P. W. Joyce, Old Celtic Romances (London, 1901).

Keating's History was translated by John O'Mahony (New York, 1866). The first part was edited with Eng. trans. by W. Halliday (Edinburgh, 1881 and 1891), and the second part by D. Conyngham and P. T. Binney (Dublin, 1901-1908). Comparatively few specimens have been published of the earlier bards. Several from a Copenhagen MS. were printed by Stern in the Zeitschr. f. celt. Phil. Phil. f. ii.; J. Hardiman, Irish Manuscripts in Revue Celtique, 1891; J. C. Mangan, The Poets and Poetry of Munster (Dublin, no date); G. Sigerson, The Bardic of the Gael (Dublin, 1906). Editions of the poems of Ferriter, Geoffrey O'Donoghue, O'Rahilly, John "Tuomy, Andrew Magrath, John Claragh MacDonnell, Tadhg Gobhach and Owen Roe O'Sullivan by Irish Texts Society, Dublin, and Irish Texts Society, London, 1900-1903. (E. C. Q.)
II. SCOTTISH GAELIC LITERATURE.—It is not until after the Forty-five that we find any great manifestation of originality in the literature of the Scottish Highlands. The reasons for this are not far to seek. Just as the dialects of Low German in the middle ages were overshadowed by the more brilliant literary dialect of the south, so Scotch Gaelic was from the outset seriously handicapped by the great activity of the professional literary class in Ireland. We may say that down to the beginning of the 18th century the literary language of the Highlands was the Gaelic of Ireland. During the dark days of the penal laws and with the extinction of the men of letters and their patrons in Ireland, an opportunity was given to the native Scottish muse to develop her powers. Another potent factor also made itself felt. After Culloden the causes of the clan feuds and animosities of the past were removed. The Highlands, perhaps for the first time in history, formed a compact whole and settled down to peace and quietude. A remarkable outburst of literary activity ensued, and the latter half of the 18th century is the period which Scottish writers love to call the golden age of Gaelic poetry. The, before we attempt to deal with this period in detail, we must examine the scanty literary productions of Gaelic Scotland prior to the 18th century.

The earliest document containing Gaelic matter which Scotland can claim is the Book of Deer, now preserved in the Cambridge University Library. This MS. contains portions of the Gospels in Latin written in an Irish hand with illuminations of the well-known Irish type. At the end there occurs a colophon in Irish which is certainly as old as the 9th century. Inserted in the margins and blank spaces are later notes and memoranda partly in Latin, partly in Gaelic. The Gaelic entries were probably made between 1000 and 1150. They relate to grants of land and other privileges made from time to time to the monastery of Deer (Aberdeen-shire). The most interesting portion deals with the legend of Deer and its traditional foundation by St Columba. The language of these entries shows a striking departure from the traditional orthography employed in contemporary Irish documents. The Advocates' Library in Edinburgh contains a number of MSS. probably written in Scotland between 1400 and 1600, but with one exception the language is Irish.

The solitary exception just mentioned is the famous codex known as the Book of the Dean of Lismore. The pieces contained in this volume are written in the crabbed current Roman hand of the period, and the orthography is phonetic, both of which facts render the deciphering of this valuable MS. a task of supreme difficulty.

The contents of this quarto volume of 311 pages are almost entirely verse compositions collected and written down by Sir James Macgregor, dean of Lismore in Argyllshire, and his brother Duncan, between the years 1312 and 1326. A disproportionate amount of space is allotted to the compositions of well-known Irish bards such as Donnvadh Mór O'Daly (d. 1244), Muiireadhach Albanach (c. 1224), Tadhg Ó Higgin (d. 1448), Diarmaid Ó Hifféen, Torna Ó Maculéonr (d. 1468). Book D gives the earliest and best preserved record of Rorí, the hymn-singer of the 16th century. We may mention Allan MacRorie, Gillie Calum Mac an Ollav, John of Knockydart, who celebrates the murder of the young lord of the isles by his Irish harper in 1490, Finlay MacNab, and Duncan Macgregor, the transcriber of the greater part of the volume. The poems of the last-mentioned writer are in praise of the Macgregors. A few other poems are by Scottish authors such as Campbell, Knight of Glenorchy (d. 1513), the earl of Argyll and Countess Isabella. A number consist of satires on women. These Scottish writers are still under the influence of Irish metric, and regularly employ the four-lined stanza. They do not appear to adhere to the stricter Irish measures, but delight rather in the freer forms going by the name of òghach. The Irish rules for alliteration and rhyme are not rigidly observed.

The linguistic peculiarities of the Dean's Book await investigation, but among the pieces which represent the Scottish vernacular of the day are the Ossianic Ballads. These, twenty-eight in number, extend to upwards of 2500 lines, and form by far the most important part of the collection. Thus the Dean's Book was compiled a full hundred years before the earliest similar collection of heroic ballads was made in Ireland. In Scotland the term Ossianic is used loosely of both the Ulster and the Fennian cycles, and it may be as well to state that three of the pieces in the volume deal with Fraoch, Conloach and the Bloody Rout of Conall Cearrach. It is interesting to note that nine of the poems are directly attributed to Ossian, two to Fergus File, one to Caolite Mac Ronan, and one to Conall Cearrach, whilst others are ascribed to Allan MacRorie, Gillie Calum Mac an Ollav and Caoilte O'Cluain, who are otherwise unknown. The Dean's Book was first transcribed by Ewen MacLachlan in 1813. Thomas MacLauchlan published the text of the Ossianic ballads with modern Gaelic and English renderings in 1822. In the same volume W. F. Skene gave a useful description of the MS. and its contents. Alexander Cameron revised the text of the portion printed by MacLauchlan, and his amended text is printed in his Reliquiae Ceticae, vol. i. (See also L. C. Stern, Zeitschr. f. cell. Phil. i. 294-326.) Between the Book of the Dean and the Forty-five we find another great gap, which is only bridged over by a collection which presents many points of resemblance to Macgregor's compilation. The Book of Fersnaig, which is also written in a kind of phonetic script, was compiled by Duncan Macrae of Inverinate between 1688 and 1693. The MS. contains about 4000 lines of verse of different dates and by different authors. The contents of the collection are mainly political and religious, with a few poems which are termed didactic. As in the Dean's Book love-songs and drinking-songs are conspicuously absent, whilst the religious poetry forms about one-half of the contents. In state politics the authors are Jacobite, and in church politics Episcopalian. The Ossianic literature is represented by 56 lines. There are a number of poems by 16th-century writers, among whom is Bishop Carsewell. Mackinnon has pointed out that the language of the Book of Fersnaig corresponds exactly to the dialect spoken in Kintail at the present day. The text of the Book of Fersnaig is printed in its entirety in vol. ii. of Cameron's Reliquiae Ceticae, and many of the poems are to be found in standard orthography in G. Henderson's Leabhar nan Geann. The metres employed in the poems show the influence of the English system of versification. (See Stern, Zeitschr. f. cell. Phil. ii. pp. 566 ff.)

Two other Highland MSS. remain to be noticed. These are the Red and Black Books of Clanranald, which are largely taken up with the histories of the families of Macdonald and with the achievements of Montrose, written in the ordinary Irish of the period by the Macvurichs, hereditary bards to the Clanranald chiefs. The Red Book was obtained by Macpherson in 1760 from Neil Macvurich, nephew of the last great bard, and it figured largely in the Ossianic controversy. In addition to poems in Irish by Neil Macvurich, who died at a great age some time after 1715, and other bardic matter, the MSS. now contain only three Ossianic poems, and these are in Irish. During the Ossianic controversy the Red Book was the focal point of the controversy. It is now in the hands of the enthusiastic Gaels of the closing years of the 18th century, and on its contents being examined and found wanting, the MS. was tampered with.

Mackenzie's Beauties of Gaelic Poetry contains poems written by a number of writers who flourished towards the end of the 17th century and at the beginning of the 18th. These are Mary Macleod, John Macdonald (Iain Lom), Archibald Macdonald, Dorothy Brown, Cicely Macdonald, Iain Dubh 'tain T. Allein (b. c. 1665), the Asdan Matheson (one of his poems was rendered in English by Sir Walter Scott under the title of "Farewell to Mackenzie, High Chief of Kintail"), Hector Maclean (also known through a translation by Scott called "War-song of Lachlan, High Chief of Maclean"), Lachlan Mackinnon, Roderick Morrison (an Clarsair Dall), and John Mackay of Gairloch, but we can here only notice the two. The famous Mary Macleod, better known as Maire Nighean Alastair Ruaidh
(c. 1588–1653), was family hard to Sir Norman Macleod of Bernera, and later to John “Breac” Macleod of Macleod, in honour of whom most of her poems were composed. Like very many of the Highland poets Mary had little or no education, and it would seem that none of the poems which have come down to us were composed before 1660. Her pieces are composed in the modern Irish metres with the characteristic vowel rhymes of the accent syllables. As might perhaps be expected it was only the Macvurichs (the professional bards of the Clanranald) who went on practising the classical débide metre. This they still continued to do during the first quarter of the 18th century. Mary Macleod’s best-known pieces comprise a dirge on the drowning of Iain Garbh (MacTdle Chium) in the Minch, a song “An Talla’m bu ghnath le MacLeod,” and an ode to Sir Norman Macleod of Bernera, produced during her exile in Mull, which begins “‘Sm’im’shuidhe air an tulaich.” For the details of her career, which are the subject of some dispute, the reader may be referred to a paper by Alexander MacKenzie in the Transactions of the Gaelic Society of Inverness, vol. xxii. pp. 43-66. Mary Macleod is accounted one of the most musical and original of the Highland bards. 

John Macdonald, better known as Iain Lom (d. c. 1710), was a vigorous and amatory poet whose verses exercised an extraordinary influence during his lifetime. He is said to have received a yearly pension from Charles II for his services to the Stuart cause. His best-known poems are Mort na Ceapach, on the murder of the heir of Keppoch, who was eventually avenged through the poet’s efforts, and a piece on the battle of Inverlochy (1645). However great the inspiration of Mary Macleod and Iain Lom, they were after all but political or family bards. In succession to them there arose a small band of men with loftier thoughts, a wider outlook and greater art. The literature of the Scottish Highlands culminates in the names of Alexander Macdonald, Duncan Ban MacIntyre and Dugald Buchan.

Alexander Macdonald, commonly called Alasdair MacMaighestr Alasdair (b. c. 1700), was the son of an Episcopalian clergyman in Moirdart. He was sent to Glasgow University to fit himself for a professional career. But an imprudent marriage caused him to abandon his studies, and about 1725 he received an appointment as a Presbyterian teacher in Ross, a post which he held for some years. In 1732 he was moved from place to place, and from 1739 to 1745 he taught at Corryvullin on the Sound of Mull, the scene of some of his most beautiful lyrics. About 1740 he was invited to compile a Gaelic vocabulary, which was published in 1741.

Macdonald has thus the double distinction of being the author of the first book printed in Scotch Gaelic and of being the father of Highland lexicography. The news of the landing of the Pretender brought visions of release to the poverty-stricken poet, who was by this time heartily sick of teaching and farming. He turned Roman Catholic, and was present at the unfurling of the Stuart standard. He was given the rank of captain, but rendered greater services to the Jacobite cause with his stirring poems than with the sword. After Culloden he suffered great privations. But in 1751 he visited Edinburgh and brought out a collection of his poetry, which has the honour of being the first original work printed in Scotch Gaelic. His volume was therefore entitled Ais-eirdidh na Seon Chonain Albannaich (Resurrection of the Ancient Scottish Tongue). Till the day of his death he led a more or less wandering life, as he was dependent on the generosity of Clanranald. Only a small part of Macdonald’s compositions have been preserved. The general character of his work is best shown in the two groups—love-songs, descriptive poems and patriotic and Jacobite poems. In his love-songs and descriptive poems Macdonald struck an entirely new note in Gaelic literature. His Moladh Morraig and Cuachan Phlasach (also called A’ Bhaisuarach Dhonn) are his best-known compositions in the amatory style. But he is distinctly at his best in the descriptive poems. We have already seen that even as early as the 8th century the poets of Ireland gave expression to that intimate love of nature which is perhaps the most striking feature in Celtic verse. Macdonald had a wonderful command of his native Gaelic. His verse is always musical, and his skilful use of epithet, often very lavishly strewn, enables him to express with marvellous effect the various aspects of nature in her softer and sterner moods alike. His masterpiece, the Biriuin of Clanranald, which is at the same time apart from Ossianic ballads, the longest poem in the language, describes a voyage from South Uist to Carrickfergus. Here Macdonald excels in describing the movement of the ship and the fury of the storm. In Allt an t-Sinclair (The Sugar Brook) we are given an exquisite picture of a beautiful scene in the country on a summer morning. Other similar poems full of melody and colour are Failte na Mor-thir (Hail to the Mainland), Oran an t-Seanraith (Ode to Summer), and Oran an Gheanraith (Ode to Winter). When this gifted son of the muses identified himself with the Stuart cause he poured forth a stream of inspiring songs which have earned for him the title of the Tyrtaeus of the Rebellion. Among these we may mention Oran nam Fheanain Gaedhel (The Song of the Clans), Bronasachd nam Fheanain gaolaid Eachal (A Call to the Highland Clans), and various songs to the prince. But incomparably the finest of all is Oran Luisghe an Fucaidh (Waulking Song). Here the prince is addressed as a young girl with flowing locks of yellow hair on her shoulders, and called Morag. She had gone away over the seas, and the poet (who is very apt to return to pastoral figures and to dress the red cloth, in other words, to beat the English red-coats). The song contains forty-seven stanzas in all, with the characteristic refrain of the waulking-songs. Am Breccan Uallach is a spirited poem in praise of the kilt and plaid, which had been forbidden by the English government. Macdonald is also the author of a number of poems in MS. which have been called the quintessence of indecency. His works have gone through eight editions, the last of which is dated 1802.

In connexion with Macdonald’s Jacobite songs it will be well to mention here the name of a kindred spirit, John Roy Stuart (Iain Ruadh Stiubhart). Stuart was a gallant soldier who was serving in Flanders with the French against the English when the rebellion broke out. He hurried home and distinguished himself on the field of battle. After Culloden he gave vent to his dejection in two pathetic songs, one on the battle itself, while the other deals with the sad lot of the Gael.

The only poet of nature who can claim to rival Macdonald is a man of a totally different stamp. Duncan Ban MacIntyre (1724-1793) was born in the poor district of Glenorchy. He never learned to read and write or to speak English. He was present on the English side at the battle of Falkirk, on which he wrote a famous ode, and shortly afterwards he was appointed gamekeeper to the earl of Breadalbane in Coire Cheathaich and Ben Dorain, where he lived for many years until he accepted a similar appointment from the duke of Argyll in Buchaall-Eite. Stewart of Luss is credited with having taken down the 6000 lines of verse of his own composition which MacIntyre had carried about with him for many years, and his works were published in 1768. In his later years he was first a volunteer and afterwards a member of the city guard in Edinburgh. In addition to his poems descriptive of nature MacIntyre composed a number of Jacobite martial songs, songs of love and sentiment, and comic and satiric pieces. The poem Mairst bhon òg addressed to his wife is, on account of its grace and delicate sentiment, generally held to be the finest love-song in the language. But it is above all as the poet of Ben and corrie that MacIntyre is remembered. He has been called the Burns of the Highlands, but the bitterness and crudity of the Burns’s poetry are foreign to MacIntyre’s. He wrote his own masterpiece in 1774. Duncan Ban describes fondly and tenderly the glories of his native mountains as only one can who spends his life in daily communion with them. His two great compositions are styled Ben Dorain and Coire Cheathaicbh. The former is a long poem of 550 lines divided into eight parts, alternating with a sort of strophe and antistrophe, one slow called urlor in stately trochees, the other swift called shibhal in a kind of galloping anaepasts; the whole ending with the crunluath or final quick motion. It is said to follow very accurately the lilt of a pipe-tune. The poem, which might be called "the Song of the Deer," has been well
done into English by J. S. Blackie, \textit{Catre Cheathaich} (The Misty Corrie), a much shorter poem than Ben Dorain, gives a loving description of all the prominent features in the landscape—the flowers, the bushes, the stones, the hillocks with the birds and game, and the whirling eddies with the glistening salmon. MacIntyre’s works went through three editions in his lifetime, and a twelfth was issued in 1901.

From Duncan Bàn we pass on to consider the compositions of two men who hailed from the outlying parts of Gaeldom. Robert Rob Donn. MacKay, or, as he is generally called, Rob Donn (1714–1778), was a native of Strathmore, Sutherlandshire, who, like Duncan Bàn, never learned to read or write. His life, which was uneventful, was spent almost entirely within the confines of the county of his birth. He left behind a large number of poems which may be roughly classified as elegiac, love and satiric poems. His elegies are of the typical Highland kind. The singer is overwhelmed with sadness and despairing in his loss. His best-known composition in this style is “The Death-Song of Hugh Macpherson.” Having just heard of the death of Pelham, the prime minister, MacKay finds a poor friend of his dying alone amid squash in the heart of the mountains. In a poem composed on the spot the poet contrasts the positions of the two men and reflects on the vanity of human existence. Among his love-poems the “Shieling Song” is deservedly famous. But it was above all as a satirist that MacKay excelled during his lifetime. Indeed he seems to have had the sharpest tongue of all the Highland bards. We have already seen what powers were attributed to satirical poets in Ireland in medieval times, and though bodily disfigurements were no longer feared in the 18th century, nothing was more dreaded, both in Ireland and Scotland, than the lash of the bard. Hence many of Rob Donn’s compositions have lost their point, and opinions have been greatly divided as to his merits as a poet. His collected poems were first published in 1829, a second edition appeared in 1871, and in 1899 two new editions were issued simultaneously, the one by Hew Morrison, the other by Adam Gunn and Malcolm Macfarlane. Another satirical poet who enjoyed a tremendous reputation in his own day was John MacCodrum, a native of North Uist and a contemporary of the men just mentioned. It is related of MacCodrum that the tailors of the Long Island refused to make any clothes for him in consequence of a satire he had directed against them. He was encountered in a ragged state by the Macdonald, who on learning the cause of his sorry condition promoted him to the dignity of bard to his family. Consequently a number of his compositions are addressed to his patrons, but one delightful poem entitled \textit{Smeibrach Chliann Domhnull} (The Mavis of Clan Donald) describes in verses full of melody the beauties of his beloved island home.

In the lyrical outburst which followed the Forty-five it was only to be expected that religious poetry should be represented. We have seen that much of the space in the Dean’s Book and in the Book of Fersnaig is allotted to verse of a pious order, though apart from the works of such Irish singers as Donnchadh O’Daly the poems do not reach a very high pitch of excellence. The first religious poem to be printed in Scotch Gaelic was a long hymn by David Mackellar, published in 1753. But incomparably the greatest writer of hymns and sacred poems is Dugald Buchanan (1716–1768). Buchanan was born in Strathyre in Perthshire and was the son of a miller. He received a desultory kind of education and tried his hand at various trades. In 1753 he was appointed schoolmaster at Drumcater near Kinloch Rannoch. He was selected to assist Stewart of Killin in preparing the first Highland version of the New Testament for the Society for Propagating Christian Knowledge (published 1757), and at the same time he issued an edition of his own poems. Of all Gaelic books this has been far and away the most popular, having gone through no less than forty editions. Buchanan seems to have been very susceptible to religious influences, and the stern Puritan doctrines of retribution and eternal damnation preached around him so worked on his mind that from his ninth to his twenty-sixth year he was a prey to that mental anguish so eloquently described by Bunyan. The awful visions which presented themselves to his vivid imagination find expression in his poems, the most notable of which are “The Majesty of God,” “The Dream,” “The Sufferings of Christ,” “The Day of Judgment,” “The Hero,” “The Skull,” “Winter” and “Prayer.” In the “Day of Judgment,” a poem of about 120 stanzas, we are given in sublime verses a vivid delineation of the crack of doom as the archangel sounds the last trumpet. The poet then goes on to depict the awful scenes consequent upon the wreck of the elements, and pictures the gathering together of the whole human race before the Throne. But Buchanan’s masterpiece is admittedly “The Skull.” Traces of the influence of English writers have been observed in all the poet’s writings, and it seems certain that the subject of his greatest poem was suggested by Shakespeare. The poet seated by a grave espy a skull. He takes it up and muses on its history. This poem in 44 stanzas concludes with a picture of the torments of hell and the glories of heaven.

The writers whom we have been discussing are practically unknown save to those who are able to read them in the original. Now we have to turn our attention to a man whose works have never been popular in the Highlands, but who nevertheless plays a prominent part in the history of European literature. Though the precise origin of the Fenian cycle may remain a moot-point to all time, the development of the literature centring in the names of Finn and Ossian is at any rate clear from the 11th century onwards. The interest taken in Celtic studies since the middle of the 19th century in Ireland and Scotland elsewhere has accumulated a body of evidence which has settled for all time the celebrated dispute as to the authenticity of Macpherson’s Ossian. James Macpherson (1736–1790), a native of Kingussie, showed a turn for versification whilst yet a student at college. Whilst acting as tutor at Moffat he was asked by John Home as to the existence of ancient Gaelic literature in the Highlands. After some pressing Macpherson undertook to translate some of the more striking poems, and submitted to Home a rendering of “The Death of Oscar.” Blair, Ferguson and Robertson, the foremost men in the Edinburgh literary circles of the day, were enthusiastic about the unearthing of such unsuspected treasures, and at their instance Macpherson published anonymously in 1760 his \textit{Fragmenta of Ancient Poetry, collected in the Highlands of Scotland and translated from the Gaelic or Erse Language}. This publication contained in all fifteen translations, preceded by a preface from the pen of Blair. Published under such auspices, Macpherson’s venture was bound to succeed. In the preface it was stated that among other ancient poems an epic of considerable length existed in Gaelic, and that if sufficient encouragement were forthcoming the author of the versions would undertake to recover and translate the same. A subscription was raised at once, and Macpherson set out on a journey of exploration in the Highlands and islands. As the result of this tour, on which he was accompanied by two or three competent Gaelic scholars, Macpherson published in \textit{London} in 1762 a large quarto containing his epic styled \textit{Fingal} with fifteen other smaller poems. In the following year a still larger epic appeared with the title of \textit{Temora}. It was in eight books, and contained a number of notes in addition to \textit{Cath-Loda} and other pieces, along with the seventh book of \textit{Temora} in Gaelic as a specimen of the original. Ten years later a new edition of the whole was issued. The authenticity of Macpherson’s translations was soon impugned by Dr Johnson, Hume and Malcolm Laing, and the author was urged by his friends to publish the originals. Macpherson prevaricated, even though the Highlanders of India sent him a cheque for £1000 to enable him to vindicate the antiquity of their native literature. Macpherson at different times, and particularly towards the end of his life, seems to have had some intention of publishing the Gaelic of his Ossian, but he was naturally deterred by the feeling that his knowledge of Gaelic was becoming shakier with his continued absence from the Highlands. At any rate he left behind a quantity of Gaelic matter in MS. which was ultimately
published by the Highland Society of London in 1807. This MS., however, was revised and transcribed by Ross and afterwards destroyed, so that we are ignorant of its nature. The Highland Society also instituted an inquiry into the whole question, but their conclusions were somewhat negative. They succeeded in establishing that the characters introduced by Macpherson were familiar in the Highlands and that Osianic ballads really existed, which Macpherson had utilized. Macpherson's claims still found ardent advocates, such as Clark, in the 'seventies, but the question was finally disposed of in papers by Alexander MacChain (1885) and L. C. Stern (1893). We can here only summarize briefly the main lines of argument. (1) Macpherson's Osian is full of reminiscences of Homer, Milton and the Hebrew prophets. (2) He confuses the Ulster and the Fenian heroic cycles in unparдонable fashion. (3) The Gaelic text of 1807 only represents one-half of the English versions (11 poems out of 22 poems). Some Gaelic fragments from different poems appeared prior to 1807, but these differ considerably from the "official" version. (4) In the Gaelic text of 1807 the version of the passage from Temora is quite different from that published in 1793. (5) Macpherson's Gaelic is full of offences against idiom and un-naturally strained language. (6) The names Morven and Selma are entirely of his own invention (see also MACPHERSON, JAMES). As a result of the stir caused by Macpherson's work a number of men set about collecting the genuine popular literature of the Highlands. A few years before the appearance of Fingal, Jeremy Stone, a schoolmaster at Dunkeld, had collected ten Osianic ballads and published one of them in an English versified translation. For this collection see a paper by D. Mackinnon in the Transactions of the Gaelic Society of Inverness, vol. xiv. pp. 314 ff. Unfortunately other persons were led to follow Macpherson's example. The chief of these imitators were (1) John Clark, who in 1778 published, along with several others, an English poem Mordubh, later translated into Gaelic by Gillies; (2) R. Macdonald, son of Alexander Macdonald, who is the author of the Woss o' the Wess o' the Bard; (3) John MacPhysal of Campbeltown (d. 1807), author of fourteen Osianic poems styled Seannadha, published in English in 1780 and in Gaelic in 1787; (4) D. MacCallum of Arisaig, who in 1821 published Callath and a complete Mordubh, "by an ancient bard Fornar."

Later poets.

Ewen Macphadlan (1775-1822), the first translator of the Dean's Book, was assistant librarian of King's College and rector of the grammar school of Aberdeen. Amongst other things he translated the greater part of seven books of Homer's Iliad into Gaelic heroic verse, and he also had a large share in the compilation of the Gaelic-English part of the Highland Society's Dictionary. A number of Gaelic poems were published by him in 1816. These consist of poems of nature, e.g. Dhan nan Aimhreas, Don a Doil, et cetera. Lachan, one of a well-known love-song, the Ealaideadh Chual, William Ross (1762-1790), a schoolmaster at Gaighloch, is the typical Highland poet of the tender passion, and he is commonly represented as having given to an early grave in consequence of unrequited affection. His finest compositions are Fearag Luan and Moladh na h-eithige Gaelich. Another exquisite song Cuchag nam Cruth, is usually attributed to this poet, but it seems to go back to the beginning of the 18th century. A fifth edition of Ross's poems appeared in 1902. The most popular writer of sacred poems after Buchanan is undoubtedly Peter Grant, a Baptist minister in Strathpey, whose Dhoyn Spiorodaidh (first published in 1809) reached a twentieth edition in 1904. Sweetness, grace and simplicity are the characteristics which have endeared him to the heart of the Gael. Two other well-known hymn-writers spent their lives in Nova Scotia—James Macgregor (1759-1850) and John Maclean, a native of Tiree. The remains of the latter have been published under the title Clarsach na Ceile (Glasgow, 1881). But John Morrison (1790-1842), the poet-blacksmith of Rodel, Harris, is the most worthy of the name of successor to Buchanan.

His works have been carefully edited in two volumes by George Henderson (2nd edition, 1896). His poems are remarkably musical and imaginative, and some of the most characteristic are An Fiodrain and Tha duin' og agus seanm duin' again. Wille MacDhunleibhe (1808-1870) was a native of Islay. He received scarcely any education, and was apprenticed as a tailor, but he early made his way to the mainland. He was ever a fierce Anglophobe and did his best to make up for the deficiencies of his early training. He published in English a Vindication of the Celtic Character, and attempted to issue a History of Scotland in parts. His poems, which have been at least twice published (1835, 1882), are equally powerful in the expression of ruthless fierceness and tearful sorrow. In Fios thin a' Bhioridh he sings pathetically of the passing of the older order in Islay, and another powerful poem entitled Duain Geall deals with the campaign of the Highlanders under Sir Colin Campbell in the Crimea. Livingston's contemporary, Evan MacColl (1808-1858), the son of a small farmer on Lochalsh, in his early years devoted eagerly all the English literature and Gaelic lore that came in his way. In 1856 he issued a volume of songs called the Mountain Minstrel, containing his productions in Gaelic and English. Two years later two volumes appeared, one entirely in Gaelic, styled Clarsach nam Beonn, the other in English under the old title. A third edition of the Gaelic collection was published in 1886. MacColl acted for many years as clerk in the custom-house at Liverpool, and afterwards he filled a similar post at Kingston, Canada. He has been called the Moore of Highland song. His spirit is altogether modern, and his poems are much nearer the Lowland type than those of the older bards. Amongst his best-known pieces are Bás Mairi and Duana Ghaol. We can do no more than mention the names of John MacLachlan of Ra hoy (1804-1874), James Munro (1794-1870), well known as a grammarian, Dugald MacPhail (b. 1818), Mrs Mary Macpherson, Angus Macdonald (1804-1874), Mrs Mary MacKellar (1834-1890) and Neil Macleod (b. 1843), author of a popular collection Clarsach a' Rithist ed., 1885; 3rd ed., 1904). Neil Macleod is also the writer of the remarkable song Dang an iomlan an robh mi ë, Others whom we cannot mention here are known as the authors of one or more songs which have become popular. It is natural to compare the state of affairs at the beginning of the 20th century with that obtaining in 1800. In the dawn of the 19th century every district in the Highlands had its native poet, whilst a century later not a single Gaelic bard of known reputation existed anywhere within its borders. It is only too evident that the new writers prefer English to Gaelic as a medium of literature, partly because they know it better, but also because in it they appeal to a far wider public. It will have been observed that we have said nothing about prose works written in Gaelic. Original Gaelic prose is conspicuous by its absence. The first printed work is the translation of Knox's Liturgy by Bishop Carsewell, published in 1567 (reprinted in 1573). Calvin's Catechism is said to have been issued in 1631. The Psalms and Shorter Catechism appeared in 1656, while two other psalmists saw the light before the end of the century, one by Kirkie (1684), the other issued by the Synod of Argyll (1694). The language of all these publications may, however, be termed Irish. Apart from reprints of the catechism and psalter, the only other Gaelic matter which appeared in print before 1750 were Kirkie's Irish version of the Bible in Roman type with a vocabulary (1690), and the Vocabulary by Alexander Macdonald (1741). But from the middle of the 18th century translations of the works of English religious writers streamed from the various presses. Alleine, Baxter, Boston, Bunyan, Doddridge and Jonathan Edwards were all prime favourites, and their works have gone through many editions. Apart from a well-meant but wholly inadequate version of Schiller's Tell, the only non-religious work which can be termed literature existing in a Gaelic translation is a portion of the Arabian Nights, though fragments of other classics such as Lamb's Tales from Shakespeare have appeared in magazines. The one-sided character of Gaelic literature, in addition to exercising a baneful influence on Highland character, has in the
long run of necessity proved adverse to the vitality of the language. The best standard of Gaelic is by common consent the language of the Scriptures. James Stewart of Killin's version of the New Testament, published by the Society for propagating Christian Knowledge, was followed by a translation of the Old Testament in four parts (1783–1801), the work of John Stewart of Luss and John Smith of Campbeltown. The whole Gaelic Bible saw the light in 1807. But the revision of 1826 is regarded as standard. The translators and revisers had no norm to follow, and it is difficult to say how far they were influenced by Irish tradition. Much in the Gaelic version seems to savour of Irish idiom, and it is a pity that some competent scholar such as Henderson has not investigated the question. Of original prose works we can mention two. The one is a History of the Forty-five (Eschaidh o' Phrinnsna, no Bladhna Thearloich), published in 1825 by John MacKenzie, the compiler of the Beauties of Gaelic Poetry (1806–1843). A second edition of this book appeared in 1906. The other is the more famous Caoraíd nan Gaoideal, by Norman Macleod (new edition, 1890). This volume consists mainly of a number of dialogues dealing with various departments of Highland life. It was largely contributed to various magazines from 1820 to 1848. Macleod's style is racy and elegant, and his work is deservedly popular.

In conclusion we must take notice of the more important collections of folklore. Gaelic, like Irish, is extraordinarily rich in proverbs. The first collection of Gaelic proverbs was published in 1795 by Donald Macintosh. This work was supplemented and enlarged in 1881 by Alexander Nicolson, whose book contains no fewer than 3900 short sayings. A large collection of Gaelic folk-tales was gleaned and published by J. F. Campbell under the title of Popular Tales of the West Highlands (4 vols., Edinburgh, 1862). Alexander Carmichael published a version of the Tàin Bò Cailge, called Toiriocht na Táine, which he collected in South Uist (Transactions of the Gaelic Society of Inverness, ii. 25–42), also the story of Deirdre and the sons of Uisneach in prose taken down in Barra (b. xiii. 241–257). Five volumes of popular stories, collected by J. G. Campbell, D. MacInnes, J. Macdougall and Lafith Campbell, have been published (1889–1895) by Natt under the title Wafis and Strays of Celtic Tradition. These collections contain a good deal of matter pertaining to the old heroic cycles. Seven ballads dealing with the Ulster cycle were collected and printed by Hector Maclean under the title Ullonian Ho-ro-ballads (Glasgow, 1892). Macpherson gave a fillip to collectors of Ossianic lore, and a number of MSS. going back to his time are deposited in the Advocates' Library at Edinburgh.

J. F. Campbell spent twelve years searching for variants, and his results were published in his Leabhar na Feinne (1872). This volume contains 54,000 lines of heroic verse. The Edinburgh MSS. were transcribed by Alexander Cameron, and published after his death by Alexander Macbain and John Kennedy in his Reliquiae Celicæ. This work is therefore a complete corpus of Gaelic heroic verse. Finally the charms and incantations of the Highlands have been collected and published by Alexander Carmichael in two sumptuous volumes under the title Carmina Gualda (1900).

AUTHORITIES.—The standard work is Magnus Maclean, The Literature of the Highlands (London, 1904); see also various chapters in the same writer's Literature of the Ceilts (London, 1902); L. C. Stern, Die Kultur des Highlands und des Islands (Berlin, 1911), pp. 1–108; Nigel Nicolls, The Literature of the Highlands (Inverness, 1892); J. S. Blackie, The Language and Literature of the Scottish Highlands (Edinburgh, 1876); P. T. Pattinson, Gaelic Bards (1890); L. Maclean, Songs and Hymns of the Scottish Highlands (1885); John Maclean, New Gaelic Gealach, or The Beauties of Gaelic Poetry (new ed., Edinburgh, 1904); A. Sinclair, An t-Oranach (Glasgow, 1879); The Book of Deer, edited for the Spalding Club by Dr. Stuart (1866); Alexander Macbain, Transactions of the Gaelic Society of Inverness, iii. 23–30; The Book of the Dean of Lismore, edited by T. MacLauchlan (1862); Alexander Cameron, Reliquiae Celicæ (Inverness, 1892–1894); John Reid, Bibliotheca Scole-Celitica (Glasgow, 1832); Catalogue of the books in the Celtic department, Aberdeen University Library (1897); George Henderson, Leabhar nan Gleann (Inverness, 1898); D. MacKinnon, "The Fergian MS." in Transactions of the Gaelic Society of Inverness, xi. 311–339; J. S. Smart, James Macpherson, An Epitome in Literature (London, 1905); L. C. Stern, "Die Ossianischen Heldenlieder" in Zeitschrift für vergleichende Litteraturgeschichte (1865), translated by J. L. Robertson in Transactions of the Gaelic Society of Inverness, xxv. 257–265 (ed. Lt.-Col. W. H. S. Sclater, Edinburgh, 1879); 3rd ed., viii. 77–100 (ed. L. C. Macleod, Modern Gaelic Bards (Stirling, 1908). (E. C. Q.)

III. Manx Literature.—The literary remains written in the Manx language are much slighter than those of any other Celtic dialect. With one small exception nothing pertaining to the saga literature of Ireland has been preserved. The little we possess naturally falls under two heads—original compositions and translations. With regard to the first category we must give the place of honour to an Ossianic poem contained in a MS. in the British Museum (written in 1759), which relates how Orrice, Finn's enemy, was tormented by the women of Finn's household when the latter was away hunting, how he in revenge set fire to the house, and how Finn had him torn in pieces by wild horses. Most of the existing literature of native origin, however, consists of ballads and carols, locally called daleels. These used to be sung on Christmas eve in the churches, the members of the congregation each bringing a candle. Any one who pleased could get up and sing one. These carvels deal largely with the end of the world, the judgment-day and the horrors of hell. About eighty of them were published under the title of Carevalyn Galíckagh (Douglas, 1891). An attempt is being made by Yn Cheshaghail Gàilckagh to revive the Oid Òhairrey (=Irish Òidheach Fhèithe Mhiur), "the feast of Mary," as the festival used to be called, and gatherings in the old style have been held in Peel for the last two or three years. Apart from the carvels there are other ballads in existence, the most important of which were printed in vol. xvi. of the Publications of the Manx Society. The earliest is an 18th-century song of Manannan Mac y Lheir, traditionally supposed to have been written in the 16th century, and which tells of the conversion of the island by St Patrick. Then comes Baose Íliam Bhàine (The Death of Brown William), dealing with the death of William Christian, who was shot as a traitor in 1662. The best-known Manx song is Myseeadhruis (Irish Meiclachaire). It is directed against a man of this name who was the first to give a dowry to his daughter, the custom having previously been for the bridegroom to pay money to the father of the bride. Others are Ny Kirrejo Jo Snìochtj (The Sheep under the Snow), a song about the loss of the Douglas herring fleet in 1787 (reprinted at Douglas, 1872), and O Vannin Veeg Veen (Dear little Mona). A further ballad was taken down by J. Strachan and is published in the Zeitschrift für celtische Philologie, i. 79. In 1760 Joseph Bridson wrote a "Short Account of the Isle of Man" in Manx (Coentity Ghiare ieh Eillan Vannin ayns Gaileck), which was reprinted in vol. xx. of the Publications of the Manx Society. The translated literature is almost entirely of a religious character. Jenner prints a list of twenty-three volumes in his article referred to below, but we can only here mention the most important. The first is the translation of the English Prayer-Book by Bishop Phillips, 1610 (published by A. W. Moore, Oxford, 1850). The Sermons of Bishop Wilson in 3 vols. (1758) are a very rare work, highly important, and now rare. Some Manx prose, and it is to be hoped that Yn Cheshaghail Gàilckagh will soon reprinted it. A translation of parts of Milton's Paradise Lost (Pargys Caillit) by Thomas Christian, 1766, is reprinted in vol. xx. of the Publications of the Manx Society. The latter translation is the English Prayer-Book was printed in 1765 and again in 1777 and 1840. But by far the most important of all is the translation of the Bible. The energetic Bishop Wilson managed to get parts of the Scriptures translated and the Gospel of St Matthew was printed in 1748. Wilson's successor, Bishop Hildesley, completed the work, and in 1775 the whole Bible appeared. The last reprint of the Bible appeared in 1810, that of the New Testament in 1810 (?) As a curiosity it may be mentioned that recently Aesop's Fables have been translated into the vernacular (Douglas, 1901).

IV. Welsh Literature.—The oldest documents consist of glosses of the 9th and 10th centuries found in four MSS.—Oxfordensis prior and posterior, the Cambridge Juvenecus and Martianus Capella. These glosses were published by J. Loth in his *Vocabulaire vieux-breton* (1884), but their value is entirely philological. In addition, we possess two short verses, written in Irish characters, preserved in the Juvenecus Manuscript in the University Library at Cambridge (printed in Skene’s *Four Ancient Books of Wales*). This manuscript is a verbatim transcription of the Gospels dating from the 9th century. The value of these two verses is threefold: they give us, in the first place, a specimen of the Welsh language at a time when the modern laws of euphony were in a comparatively elementary stage; secondly, they are of the utmost importance to the historian tracing the development of Welsh versification, and, in future research, they must be taken into account by the historian of modern metres in other languages; and, thirdly, the similarity of their form and diction to other verses, attributed to Llywarch Hen, preserved in a much later orthography, will be a serious consideration to the higher critic in Welsh literature.

All the prose and verse of the succeeding centuries, that is to say from the 10th to the beginning of the 14th, is preserved in four important manuscripts, written during the latter half of the period. The first of these manuscripts is the *Black Book of Carmarthen*, a small quarto vellum manuscript of fifty leaves, written in Gothic letters by various hands during the reign of Henry II. (published in facsimile by Gwynogvryn Evans, Oxford, 1907). This book belonged originally to the priory of Black Canons at Carmarthen, from whom it passed to the church of St David; at the suppression of the monasteries in the reign of Henry VIII. it was presented by the treasurer of that church to Sir John Price, one of the king’s commissioners, and from him it passed eventually into the hands of Sir Robert Vaughan, the owner of the famous Hengwrt collection. It is now among the Penarth MSS, undoubtedly the most valuable collection of Welsh manuscripts in the United Kingdom.

The second manuscript is the *Book of Aneirin*, a small quarto manuscript of nineteen leaves of vellum, written about 1250. It was at one time in the possession of Sir Thomas Phillips of Middlehill, and now belongs to the free library of the city of Cardiff. The third is the *Book of Taliesin*, in the Hengwrt and subsequently in the Penarth collection. It is a small quarto manuscript containing thirty-eight leaves, written in Gothic letters, about the early part of the 14th century. The fourth manuscript, and in some respects the most important, is the *Red Book of Hergest*, so called from Hergest Court, one of the seats of the Vaughans. It is afolio volume of 360 leaves written by different hands between the beginning of the 14th and the middle of the 15th century. This manuscript, which is the most extensive compilation of the medieval prose and verse of Wales, is now in the possession of Jesus College, Oxford, and is kept in the Bodleian Library of that university. The main body of the poems contained in these four MSS. was printed by W. F. Skene with a tentative English version in his *Four Ancient Books of Wales*.

The other Welsh manuscripts, ranging down from the 13th to the 18th century, are far too numerous to notice, and it is outside the scope of this article to deal minutely with the original sources of the text of Welsh writings.

We will now only endeavour to sketch the history of Welsh literature from these early centuries down to our own times, and to show how the Celtic people of Wales have developed a literature true to their own genius, and how that literature stands to this day both a minister to the culture of the Welsh people and a sure indication of it.

1. Early Latin Writers.—The works now known as those of Gildas (g.v.) and Nennius (g.v.) are written in Latin; they throw considerable light on the origin of Welsh romantic literature and on the history of the earlier poems. Gildas was born at Alldydd, the modern Dumbarton, that part of Britain which is called by Welsh writers *Y Gogledd*, or the North. Several dates have been assigned for his birth and death, but he probably flourished between 500 and 580, and his book, *De Excidio Britanniae* seems to have been written about 560. This work is a sketch of British history under the Romans and in the period after their withdrawal from the country, and includes the period of the wars of the Britons with the Picts, Scots and Saxons. Mr Skene suggests very reasonably that the well-known letter of the Britons to Aetius, asking for Roman aid, is misplaced, and that if put in its own place some of the anachronisms of Gildas will disappear. This work, which contains some spirited attacks on the leaders of the Britons for their sins, is strangely full of contradictions. It seems to be the work of some person well versed in the facts of that part of British history, to whom he had an easy access, but who supplemented them with traditional details and with dates which were mere guess-work. Mr Skene thinks that the work of Nennius was originally written in Welsh in the north and was afterwards translated into Latin.

This nucleus was added the genealogical substance, and the book was written down to 738. Afterwards some person, called Marc in the *Manuscrit*, appended probably about 823 the life of St Germanus and the legends of St Patrick, which were subsequently incorporated with the history. Some South Welshman added to the oldest manuscript of the history in these countries, about 977, a chronicle of events from 444 to 954, in which there are genealogies beginning with Orawn, son of Hywel Ddu, king of South Wales. This Chronicle, which is not found in other manuscripts, has been made the basis of two later chronicles brought down to 1286 and 1288 respectively. It is consequently not the work of one author. A learned Irishman named Gilla Coemgin, who died in 1072, translated it into Irish and added many things concerning the Irish and the Picts. The *Historia Britannum* is more valuable for the legendary matter which it contains than for what may be accepted as history, for it gives us the British legends of the colonization of Great Britain and Ireland, the exploits of King Arthur and the prophecies of Merlin, which are not found elsewhere before the 12th century. The date of the book is of the greatest importance to the history of medieval romance, and there can be no doubt that it is earlier than the Norman Conquest and that the legends themselves are of British origin.

2. The Epic Period, 700-950.—The higher criticism of the early poetry of Wales contained in the four ancient manuscripts already mentioned has undergone a good many changes since their contents first excited the curiosity of English scholars. In turn Welshmen, with more zeal than discretion, have displayed an amazing charlatanism in the extraordinary theories which they put forth, and Englishmen have shown an utmost meanness in belittling what is undoubtedly a most valuable monument of the past. But now the labours of Zeus and others who have made a study of Celtic philology furnish us with much safer canons of criticism than existed in 1849, when even a learned Welshman, the late Thomas Stephens, who did more than any one else to establish the claims of his country to a real literature, doubted the authenticity of a large number of the poems said to have been written by Taliesin, Aneirin, Myrddin and Llywarch Hen, who are supposed to have lived in the 5th century. A great service was done to Welsh literature by the publication of the texts of those poems from the four ancient manuscripts by W. F. Skene. In addition to the text, translations of the poems were furnished by Dr Silvan Evans and the Rev. Robert Williams, but the translation, though on the whole a very creditable work, is full of mistakes which few men, writing at that time, could have avoided. The publication of the text of the Black Book, with notes by Dr Gwynogvryn Evans, will be of great service towards clearing up the mist which envelops this older literature.

Most of the poems in these four manuscripts are attributed to four poets, Aneirin, Llywarch Hen, Taliesin and Myrddin, who are said to have lived and written in Cumbria or Y Gogledd, where the actors in the events referred to also lived. The greater part of this region enjoyed substantial independence down to the end of the 9th century, with the exception of the
interval from 655, when they were subjected to the kingdom of Northumbria by Oswy after the defeat of Cadwallon and Penda, to the battle of Dunwich in 686, when Ecgfrith, King of Northumbria, was defeated. From the 7th to the 9th century Cumbria, including under that name all the British territory from the Ribble to the Clyde, was the principal theatre of British and Saxon conflict. The rise of the dynasty of Maelgwn Gwynedd, who, according to Welsh tradition, was a descendant of Cunedda Wledig, one of the Picts of the north, brought Wales into close connexion with the Cumbrian kingdom, and prepared both North and South Wales for the reception of the northern traditions and the rise of a true Welsh literature.

Whether the poets of the north really wrote any of the poems which in a modified form have come down to us or not, there can be no doubt that a number of lays attributed to them lived in popular tradition, and that under the sudden burst of glory which the deeds of Cadwallon called forth and which ended in the disastrous defeat of 655, a British literature began to spring up, and was nourished by the hopes of a future resurrection under his son Cadwaladr, whose death was disbelieved in for such a long time. These floating lays and traditions gradually gathered into them the characteristic features, breadth and vigour, which the bards who fled before advancing hosts of the victorious Saxon kings of the north. The heroes of the north became now the heroes of Wales, and the sites of the battles they fought were identified with places of similar name in Wales and England.

By far the longest and the most famous poem of this series is attributed to Aneurin. This spelling of his name is comparatively modern, and in the old manuscripts it is given as Aneirin. The later form seems to have been affected by the form eurin, "golden," and to owe the continuation of the misspelling to a belief that the poet and Gildas, whose name is supposed to be the Latin form of the Old English gelden, were one and the same person. This poem, called the Gododin (with notes by T. Stephens and published by Prof. Powel for the Cymmrodorion Society, London, 1888), is extremely obscure, both on account of its vocabulary and its topography and allusions. It deals mainly with "the men who went to Cattraeth," which is supposed to have been fought between the Britons and the English, the Dracs, the Great Britains, and the pagan Saxons and their British subjects in Dewey (Deira) and Brynëch (Bernicia), and the half-pagan Picts of Guotodin, a district corresponding to the northern half of the Lothians along the Firth of Forth. Critics have attempted with partial success to cast some light on its obscurity by supposing that the poem as a whole is made up of two parts dealing with two distinct battles. This may or may not be, but there is no doubt that many of the stanzas of the poem as found in the manuscript are not in their proper places, and a critical readjustment of the different stanzas and lines would do much towards solving its problem. It seems probable, too, that the original nucleus of the poem was handed down orally, and recited or sung by the bards and minstrels at the courts of different noblemen. It thus became the common stock-in-trade of the Welsh rhapsodist, and in time the bards, using it as a kind of framework, added to it here and there pieces of their own composition formed on the original model, especially when the heroes named happened to be the traditional forefathers of their patrons, and occasionally introduced the names of new heroes and new places as it suited their purpose; and all this seems to have been done in early times. Older fragments dealing too with the legendary heroes of the Welsh were afterwards incorporated with the poem, and some of these fragments undoubtedly preserve the orthographical and grammatical forms of the 9th century. So that, on the whole, it seems as fruitless to look for a definite record of historical events in this poem as it would be to do so in the Homeric poems, but like them, though it cannot any longer be regarded as a correct and definite account of a particular battle or war, it still stands to this day the epic of the warriors of its own nation. It matters not whether these heroes fought at far Cattraeth or on some other forgotten field of disaster; this song still reflects, as a true national epic, the sad defeats and the brave but desperate rallies of the early Welsh. Like the music of the Welsh, its dominant note is that of sadness, expressing the exultation of battle and the very joy of life in minor notes. To a great extent Welsh poets are to this day true and faithful disciples of this early master.

Many of the poems attributed to Taliesin are undoubtedly late. Indeed, both Taliesin and Myrddin, the one as the mythological chief of all Welsh bards and the other as a great magician, seem pre-eminently suited to attract a great deal of later Welsh poetry under their aegis; but the older poems attributed to them are worthy of any literature. Sometimes, as in the verses attributed to Llywarth Hen beginning Staffel Cyndydylan, an early specimen of poetic grief over departed glory, we find that gentle elegiac note which is so common in early English poetry. In the Taliesinics poems, the Battle of Argoed Llywein and others, we have that boldness of portraiture which is found in the Gododin, whilst in many a noble line we seem to hear again the ravens screaming shrilly over their sword-feasts, and the strong strokes of the advancing warriors. It was but natural that all the pseudo-prophetic poems, written after the events which they foretold, should be attributed to the chief among seers, Myrddin. And, as his name is written in English, Merlin; so that all the poems accredited to him, with the exception perhaps of the Aneirin, were not written before the 12th century.

In most of the poems attributed to Llywarth Hen and in some of the Myrddin poems, the verses begin with the same line, which, though it has no direct reference to the subject of the poem itself, is used as a refrain or catch-word, exactly like the refrains employed by Mr Swinburne and others in their ballads. These lines generally refer to some natural object or objects, as, for instance, "the snow of the mountain" or "bright are the tops of the broom."

The first period, then, of Welsh literature lies between 700 and 930. It is in most respects the epic period, the period in which poets wrote of great men and their deeds, the legendary and the historic heroes of the Cymry, men like Urien Rheged, and heroes like Hywelodd. Even in the next period the epic note had not quite died out.

The English Romances and the Poet Princes, 1100-1290. It will be seen that there is a considerable gap between the first and second period of Welsh literature. It must not be supposed, however, that nothing was composed or written during these years. Indeed, it may well be that some of the poetry attributed to the minor bards of the last period was composed between 900 and 1100, and that some other poetry too was written and lost. But there are abundant reasons for believing that Welsh poetry was at a very low ebb during those years. The progress of Wales as a political unit had suffered a check after the battle of Chester in 613. The effects of this defeat were not immediate, as the Welsh had still enough of their characteristic hopefulness to expect ultimate victory; we therefore have reasons for believing that the Gododin series of poems were still used—or perhaps used then for the first time—to spur on "the hawks of war " to greater efforts. Gradually, however, the Angles, hemming them in on all sides from the Clyde to the Severn, began to press nearer and nearer; the Welsh at last seem to have lost heart, and no one any longer " had the desire of song." Content with their old epics and their older myths, which owe perhaps to these years a darker and more sombre tinge, they allowed their song to be hushed. The great lords had hardly chosen their final abodes; the smaller lords had all been killed in war and their places taken now by one, now by another, so that the warrior prince himself had not the leisure, and hardly the inspiration necessary, for song, and the bards found but scanty patronage among such a diminished and poverty-stricken nobility. The only order that seemed to prosper was that of the monks, and we owe them our gratitude for

---

1 It is indeed probable that Myrddin is a purely fictitious character, whose name has been made up from Caer Fyrddin (= Maridunum), which was certainly not a personal name.
preserving the ancient writings and the ancient traditions; but they were simply copyists, though they had undoubtedly some hand in giving the Gododin its final form and in setting in its convenient framework the names of the forefathers of their aristocratic abbots.

In the year 1044 Gruffyd ab Llewelyn conquered Hywel ab Edwin and became king of Wales. By means of his diplomacy and his arms he succeeded in stemming the tide of Saxon invasion that was threatening to overflow even the little remnant of land that was left to the Welsh, and his strong rule gave the Welsh muse another opportunity. Gruffyd, however, died in 1063, and was eventually succeeded in 1073 by Trahaern in North Wales, and Rhys ab Owen in South Wales. The rule of these two princes was destined to be the last period of literary inertness in the long interval following the confinement of Wales to her inaccessible highlands.

During these years a man was hiding in Ireland, called Gruffyd ab Cynan, a scion of the old branch of Welsh kings. In Brittany, too, Rhys ab Tewdwr, a claimant to the throne of South Wales, had sought the protection of his Breton kinsmen. In 1073 Rhys ab Tewdwr obtained the throne of Rhys ab Owen, and, after many years of hard fighting, Gruffyd ab Cynan, with the help of Rhys ab Tewdwr, defeated Trahaern at the battle of Myrydd Carn in 1081. On the accession of these two powerful princes the whole country broke forth into songs of praise and jubilation, and the long night was at an end.

It is important to remember that both Gruffyd and Rhys had a direct personal influence on the literary revival of their times. Gruffyd ab Cynan while in exile had seen how the Irish Oenach was held, and had seen prizes given for poetry and song. We have it on the authority of Welsh writers that he reorganized the bards and improved the music, and in many other ways gave a great and beneficial impulse to Welsh literature. He may have brought over some of the later Irish legends which have had such a powerful effect on the literature of Wales. Rhys ab Tewdwr, too, brought with him from Brittany an enthusiasm for the old Celtic tales, and perhaps some of the tales themselves which had by that time forgotten in Wales, tales of the Round Table, and Arthur "begt with British and Armoric knights," of knightly deeds and magical metamorphoses, which were destined to influence profoundly all the literatures of the West. We find, therefore, in this period that poetry flourished mostly in the North under Gruffyd ab Cynan, and prose in the south under Rhys ab Tewdwr, where the new enthusiasm for the old Welsh legends resulted in the History of Britain of Geoffrey of Monmouth, which is an expansion of the books attributed to Gildas and Nennius. It was written in Latin sometime before 1147, and is dedicated to Robert, earl of Gloucester, the grandson of Rhys ab Tewdwr. In the introductory epistle, Geoffrey states that Walter, archdeacon of Oxford, had given him a very ancient book in the British tongue, giving an account of the kings of Britain from Brutus to Cadwaladr; and that he had translated it into Latin at the archdeacon's request. The book, however, is a compilation and not a translation, but the materials were probably drawn from British sources. In this history Geoffrey asserts that the deeds of Arthur "were commonly related in a pleasing manner." He was perhaps originally but the hero of some popular ballad, or of a forgotten stanza of the Gododin, and the importance of his name in the literature of the world seems to be due to an accident. We cannot, however, in this article consider the Arthurian Legend (q.v.) as a whole; we must be content with dealing with the most important of the romantic tales which are contained in the Red Book of Hergest.

They may be divided into four classes:

(i.) The Mabinogi proper, containing (1) Pwyll, prince of Dywed; (2) Branwen, daughter of Llyr; (3) Manawyddan, son of Llyr; (4) Math, son of Mathonwy.

(ii.) Old British tales referring to Roman times, viz. (1) Lludd and Llethew; (2) The Dream of Macsen Wledig.

(iii.) British Arthurian tales, viz. (1) Kilmoch and Otwen; (2) The Dream of Rhonabwy.

(iv.) Later tales of chivalry, viz. (1) The Lady of the Fountain; (2) Peredur, son of Erawd; (3) Geraint, son of Erbin.

The group of four romances in the first class forms a cycle of legends and is called in the manuscript Peleir Keinc y Mabinogi —the Four Branches of the Mabinogi; so it is only these four tales that can, strictly speaking, be called Mabinigion. In these stories we have the relics of the ancient Irish mythology of the Tuatha Dé Danann, sometimes mixed with later myths. The Caer Sidhe, where neither disease nor old age affects any one, is the Sid of Irish mythology, the residence of the gods of the Aes Sidhe. It is called in one of the old poems the prison of Cuier, who no doubt represents Galar, son of Manandán MacLir, the Atropos who cut the thread of life of Irish mythology. Llyr is the Irish sea-god Lir, and was called Llyr Ledstwth, or the half-tongued, implying that he spoke a language only partially intelligible to the people of the country. Bran, the son of Llyr, is the Irish Bran MacAllait, Allait being one of the names of Lir. Manawyddan is clearly the Welsh Manandán or Manannán MacLir of Irish mythology. These tales contain other characters which may not have been borrowed from Irish mythology but which are common to both mythologies; for example, Rhiannon, the wife of Pwyll who possessed marvellous birds which held warriors spell-bound for eighty years by their singing, comes from Annwn, or the unseen world, and her son Pryderi gives her, on the death of Pwyll, as a wife to Manawyddan.

Of the second class the first story relates to Lludd, son of Beli the Great, son of Manogan, who became king after his father's death, while his brother Llelyw becomes king of France and shows his brother how to get rid of the three plagues which devastated Britain:—first, a strange race, the Corians, whose knowledge was so great that they heard everything no matter how low soever it might be spoken; second, a shriek which came into every house on May eve, caused by the fighting of two dragons; and third, a great giant who carried off all the provisions of the king's palace every day. The second tale relates how Maxen, emperor of Rome, has a dream while hunting, in which he imagines that he visits Britain, and in Caer Seint or Carnarvon sees a beautiful damsel, Helen, whom he ultimately finds and marries. Both tales are British in origin and are founded on traditions referring to Roman times.

The most important of these tales are undoubtedly those contained in the first class, and the story of Kilhuch and Otwen. The form in which they are found in the Red Book of Hergest is, as we have already said, comparatively speaking, modern. But it is apparent to any one reading these tales that the writers or compilers, as Matthew Arnold has suggested, are "pillaging an antiquity, the secret of which they do not fully possess." The foundations of the tales are the old Celtic traditions of the gods and the older heroes, and they clearly show Goldinelic influence both in the persons they introduce and in their incidents. The tales would at first exist only in oral tradition, and after the advent of Christianity the characters they contain lost their title and authority to the old gods and heroes of Irish bards and magicians.

In time the monks began to write these ancient stories down, embellishing them and suppressing no doubt what they considered to be most objectionable. These then are the tales which we now possess—the traditional doings of the old heroes as set in order by Christian writers.

The changes which these later copyists wrought in the substance of the tales fall into two main divisions. In the first place, they attempted to find some connexion between tales or cycles of tales which originally had no connexion whatever, and were therefore forced to invent new incidents or to introduce other incidents from the outside in order to establish this connexion; and secondly, as in the case of the Gododin, the tales were twisted and altered to support references to and explanations of names known to the writer. So we find in the tale of Math and Mathonwy the incident of the pigs is expanded to explain some place-names which the writer knew. It is this also that gives a local interest to the tales; for instance, Dywed, the land of Pwyll, has come to be regarded as the home of Hend o Lledrith, of magic and
enchantment. Some places in North Wales, especially in the vicinity of Carnarvon, seem to be well known to the writers, and, therefore, to have associated with them to all time the glamour of Maelduion. Besides the scholastic efforts of the monks, which in course of time so greatly changed these old legends, there was another class of men who had no little influence on the form and matter of Welsh; and consequently of European, romance. These were the Welsh jongleurs—the professional story-tellers, against whom the bards proper nursed a deadly hatred because, presumably, their tales drew larger audiences and won greater rewards than the aedluion of the poets. There is little doubt that this order existed in Wales at a very early period, being quite a natural evolution of the older poet who sang in comparatively free metres of the deeds of the great dead. It is these men who invented the term Mabinogî, which is supposed to mean a "tale for young people"; but whatever the word may mean, the fact that they were the stock-in-trade of the professional story-teller will explain a good many of their structural peculiarities.

Thus there existed two distinct classes of tales, though it is to be supposed that the subject matter of both was more or less common; there are, in the first place, the "four branches" and the tales of the second class, and, secondly, tales like those of the third class. With the exception of the Irish influence, which we have already referred to, and some later additions from early continental romance in the third class, we may take it that these three classes are the very old nucleus of British romance. The first that are the old tales which were first committed to writing at an early period before the influence of the Armoric Arthur began to be felt, that is to say, about the beginning of the reign of Rhys ab Tewdwr in 1073. The other tales, that is those we have put in the third class, remained for a much longer time unwritten and were not set in writing before the early Arthur of Armoric and British romance had been evolved. This will account for the fact that Arthur is not mentioned in the first class of tales, and that in the third class he is simply a British Arthur. The third class is, therefore, in a sense later than the first and second, but its materials are as old as the oldest of the Mabinogion proper, and they show the influence of Irish mythology to the same extent. In the first class Irish names like Penardim, which have not been assimilated, show conclusively that the tale is a written one, while the eloquence of the descriptions in Kilhwch ach Olwen seem to point to the fact that it was up to a late period a spoken tale. Other such tales there were once, but they have now been lost.

The romances of the fourth class do not claim much notice. They are mostly imitations or translations of Norman French originals, and they belong to the history of European chivalry rather than to the history of Welsh literature.

As literature the Mabinogion may rank among the world's classics. We cannot here point out their beauties, but it will be sufficient to notice that the unknown writer who gave them their final form was a true artist in every sense of the word. In Branwen verch Lyr, for instance, the whole setting of the story is that of a great tragedy, a tragedy neither Hellenic nor Shakespearean, but the strong and ruthless tragedy of the Celts,—the tragedy of nature among unnatural surroundings, the tragedy which in our times Mr Thomas Hardy has so successfully developed. In this tale, Branwen is introduced as the sister of Manawyddan, the king of all Britain, and as the "fairest maid in the world." But as the tragedy deepens we read how this woman, dowered with beauty and goodness and nobility of lineage, is simply used as a pawn in a political game, and the full force of the tragedy falls on her own undervosing head. She is subjected to all kinds of indignities in her husband's court in Ireland, but throughout all her severe trials she preserves the cold and detached haughtiness which characterizes the full-bosomed heroines of the northern sagas; and, in the end, when her brother has delivered her and punished the Irish, and when she has safely reached the shores of her own Môn, she raises her eyes and beholds the two islands, Britain and Ireland. "Ah! Corf! said she, 'is it well that two islands have been made desolate for my sake?' And she gave a deep groan and died." So was her tragedy consummated, and the writer, with a superb tragic touch, mentions the very shape of the grave in which they left her on the bank of the Alaw in Môn.

One of the earliest poets whose productions we can be certain of is Meilir, bard of Trahaearn, whom Gruffydd ab Cynan defeated at the battle of Carn, and afterwards of the conqueror Gruffydd himself. His best piece is the Death-bed of the Bard, a semi-religious poem which is distinguished by the structure of the verse, poetic feeling and religious thought. Meilir was the head of a family of bards; his son was Gwalchmai, one of the best Welsh poets; the latter had two sons, Einion and Meilir, some of whose poetry has reached us. In Gorochffaid Gwalcmai, Gwalchmai's Delight, there is an appreciation of the charms of nature, medieval parables to which are only to be found in Ireland. His Arwynion i Owain is an ode of considerable beauty and full of vigour in praise of Owain Gwynnedd, king of North Wales, on account of his victory of Tal y Moelv, part of which has been translated by Gray under the name of "The Triumphs of Owen." Kynddelw, who lived in the second half of the 12th century, was a contemporary of Gwalchmai, and wrote on a great number of subjects including religious ones; indeed some of his eulogies have a kind of religious prelude. He had a command of words and much skill in versification, but he is plemastic and fond of complicated metres and of ending his lines with the same syllable.

Among the other poets of the second half of the 12th century may be mentioned Owain Kyvellog and Howel ab Owain Gwynnedd. The first named was prince of Powys, and was distinguished also as a soldier. The Hirlas, or drinking-horn, is a long poem where the prince represents himself as carousing in his hall after a fight; bidding his cup-bearer fill his great drinking-horn, he orders him to present it in turn to each of the assembled warriors. As the horn passes from hand to hand he eulogizes each in a verse beginning Dïwallow di vënestr, "Fill, cup-bearer." Having thus praised the deeds of two warriors, Tudyr and Moreiddig, he turns round to challenge them, but suddenly recollecting that they had fallen in the fray, and listening, as it were, to their dying groans, he bursts into a broken lamentation for their loss. The second was also a prince; he was the eldest of the many sons of Owain Gwynnedd, and ruled for two years after his father until he fell in a battle between himself and his step-brother Daiydff. He was a young man of conspicuous merit, and one of the most charming poets of Wales, his poems being especially free from the conceits, trivial commonplaces, and complicated metres of the professional bards, while full of gay humour, a love of nature and a delicate appreciation of women. The Welsh poets went on circuit like their Irish brethren, staying in each place according as hospitality was extended to them. When departing, a bard was expected to leave a sample of his versification behind him. In this way many manuscripts came to be written, as we find them in different hands. Llywarch ab Llywelyn has left us one of those departing eulogies addressed to Rhys Gryg, prince of South Wales, which affords a favourable specimen of his style.

The following are a few of the poets of the 13th century whose poems are still extant. Davyd Benwyn was the author of a poem in praise of Llywelyn ab Iorwerth; his works, though not so verbose or trite as bardic poems of this class usually are, do not rise much above the bardic level, and are full of alliteration. Eidir Sais was, as his name implies, able to speak the English language, and wrote chiefly religious poetry. Einiawn ab Gwawn is the author of an extant address to Llywelyn ab Iorwerth of considerable merit. Phylip Bryddydd, or Philip the poet, was household bard to Rhys Gryg (Rhys the hoarse), lord of South Wales. One of his pieces, an apology to Rhys Gryg, is a striking example of the fulsome epithets a household bard was expected to bestow upon his patron, and of the privileged domesticity in which the bards lived, which, as in Ireland, must have been fatal to genius. Prydrydd Bychan, the Little Poet, was a South Wales bard whose extant work consists of short poems all addressed to his own princes. The chief feature of his Englymion is the use of a
kind of assonance in which in some cases the final vowels agreed alternately in each quatrains, and in others each line ended in a different vowel, in both cases with alliteration and change of final consonants or full rhyme. Llywad Gwr is known by an ode in five parts to Llywelyn ab Gruffydd, written about the year 1270, which is a good type of the conventional flattery of a family bard. Howel Voel, who was of Irish extraction, possessed some poetical merit; his remonstrance to Llywelyn against the imprisonment of his brother Owain is a pleasing variety upon the conventional eulogy. It has many lines beginning with the same word, e.g. ab, man. The poems of Bleddyn Vardd, or Bleddyn the Bard, which have come down to us are all short eulogies and elegies. One of the latter on Llywelyn ab Gruffydd is a good example of the elaborate and artificial nature of Welsh versification.

The most illustrious name among the poets of this century is Gruffydd ab yr Ynad Coch, "Gruffydd, son of the Red Justice," who wrote many religious poems of great merit. His greatest work, however, is the elegy to Llywelyn ab Gruffydd, the last prince of Wales. It is easily first among all the elegies written in the Welsh language. We do not find in it that artificial grief which is too evident in the Mawraddau of the Welsh poets; it re-echoes an intense personal grief, and throughout the whole piece the poet feels that he stands at the end of all things,—the end of his own ideals, the extinction of all Cymric hopes. Poignant is his grief, and in so universal a manner does the catastrophe of Llywelyn’s death present itself to him, that he imagines that all the natural features of the Welsh fatherland know that the last great Welshman is dead; the winds howl over the mountains, the rain-clouds gather thick, the waves rage with grief against the Welsh coasts, and far away on the hills the giant oak-trees beat against each other in the fury of their passion. Sadly, in this manner, closes the second period of Welsh literature.

4. The Golden Age of the Cywydd, 1340–1440.—Just as, after the loss of the North, the Welsh muse was hushed, so after the final subjugation of Wales in 1282, hardly a note was heard for many a long year. The ancient patrons of literature were dead, and the country had not yet settled down to the steady rule of England. Indeed, the conquest of Wales effectively put an end to the older Welsh poetry of that type which we noticed in the last period. These older bards were without exception subjects of the princes of North Wales, where the old heroic poetry was still popular, and when the power of these princes came to an end the old poetry too ceased. When the Welsh muse emerges again from the darkness of this interval she is no longer of the North Wales. The poets are drawn from the Welshmen of the South, a land which had practically ceased to be a part of an independent Wales shortly after the Norman conquest of England. We find, too, that the poetry which poured forth from the Welsh bards of the south is of an altogether different type; it is modern in all its essentials, in diction, in language, and, comparatively speaking, in sentiment. Indeed, there is an infinitely greater difference between Dafydd ab Gwilym and Gruffydd ab yr Ynad Coch than there is between him and any poet writing in the alliterative metres of the 14th century. So that we must suppose that at the time when the poets of North Wales still sang of war and mead-drinking in a style and diction that was an inheritance from the times of the Gododdin, the poets of the South, unharassed by wars, were developing a new poetry of their own, a poetry that had relinquished for ever the Old Welsh models and was at last in line with the great poetical movements of Europe. And, judging from the fact that the earliest of these poets whose works are accessible to us are in the full zenith of their poetical development, we must believe that their work is the consummation of a period, that is to say, that they must have had a long line of predecessors whose works were being destroyed during the period intervening between the loss of independent Wales and the rise of Dafydd ab Gwilym. These men wrote, as we have already said, in South Wales, a country which was then under the rule of the Norman lords, who, with the lapse of years and the rise of new systems, were fast becoming Welsh.

It is no wonder, then, that the poets who wrote under their patronage should show unmistakable traces of Norman influence. Most of the Rhineland still spoke French, and it was only natural that they should be well versed in French poetry. The poets followed the lead of their patrons, and their work was modelled to a very great extent on French and Provençal poetry. Nor does this account altogether for the wonderful similarity between Welsh cywyddau and other poems of this period and the French lays; we must remember that the Welsh poets lived under conditions similar to those under which the troubadours and the trouvères lived, and it was natural that the same environments should produce the same kind of work. The Provençal alba and the French aube, the serenade and other forms, became well known in South Wales and were of course read by the Welsh poets. We find continual references in the poems to ‘‘books of love’’ under the name of Ilyfr Oydd, or the ‘‘book of Ovid,’’ and a reference in one of Dafydd ab Gwilym’s poems shows conclusively that one particular Ilyfr Oydd was a work of the French poet Chrestien de Troyes. Indeed, one of the commonest names among the poets of this period—the talai, or love-messenger—may be a Romance word borrowed through the Norman-French from the Italian Galeotto, originally the name of the book of the loves of Galahad, but afterwards the ordinary word for a go-between. This book of Galeotto, by the way, was the book that taught Paolo and Francesca da Rimini, in Dante’s Divina Commedia, the tragic secret of love.

Another movement also was favourable to the rise of the new Welsh poetry. The iron hand of the church, which had been the censor of poetry for so many centuries, was slowly relaxing its grasp, and the men who a few years before would have sung religious hymns to the Virgin, now laid their tributes at the feet of divine womanhood as they saw it in the Welsh maidens and matrons living among them. The pale queen of heaven no longer held hearts captive; they had transferred their allegiance to the brow that was as the snow of yesternight, and the cheeks that were like the passion-flower.” The Iolo MSS. assert that some time between January 1327 and November 1330 there were held, under the patronage of Ivor Hael, Dafydd ab Gwilym’s patron, and others, the three Eisteddfodau Dadeni, or the Eisteddfods of the Revival of the Muse, to reorganize the bards, and to set in order all matters pertaining to Welsh poetry. The most important bards who are reported as present at some or all of these meetings were Dafydd ab Gwilym, Sion Cen, Rhys Goch of Eryri, and Iolo Goch. It is now, however, generally agreed that this account is a fabrication and that the date of all these poems is later.

Dafydd ab Gwilym is certainly the most distinguished of all the Welsh poets, and were it not for the absolute impossibility of adequately translating his cywyddau he would rank amongst the greatest poets of medieval times. By far the greater part of his poetry is written in the metre called cywydd, with heptasyllabic lines rhyming in couples. It was he who imparted so much lustre to this metre that it became the vehicle of all the most important poetry from his time to the 19th century, and he is generally referred to by his contemporaries as the special poet of the cywydd—Dafydd gywydd gwin, “Dafydd of the wine-sweet cywydd.” Most of his poems deal with love in the spirit of the medieval writers of France and of Provence, but with this very important difference, that the French writers must base their reputation on their treatment of love as a theme, whereas Dafydd’s claim to fame is based on his treatment of nature and of out-door life. In many cases, indeed, love is only a conventional peg whereon he may hang his observations on nature, and Welsh literature may claim the distinction of having had its Wordsworth in the 14th century. His treatment of nature is not merely realistic and objective, it has a certain quaint and elusive symbolism and a subjectiveness which come as a revelation to those who are acquainted with the medieval poetry of other nations. Many

1 Another derivation of this word is from Bad, “profit” + hai, a suffix denoting the agent. Others derive it from or connect it with the Irish stl.
of the poems attributed to him are undoubtedly the work of later hands, but even after making all possible deductions, there is still an infinite variety among what remains, ranging as his poems do from a sturdy denunciation of monkish fraudulence to the most delicate and pathetic recollections of departed joys. He has, besides, considerable importance as a teacher, as when, for instance, he invites the nun "to leave her watercress and paternosters of Romish monks," and to come with him "to the cathedral of the birch to listen to the cuckoo's sermons," for, "were it not an equally worthy deed to save his (Dafydd's) soul in the birch-grove as to do so by following the ritual of Rome and St James of Compostella?" Even in his old age, when he is beginning to repent of his rash and merry youth, nature has not deserted him,—the very tree under which in the old days he used to meet his sweetheart has been bent and withered in sympathy with him. Though Dafydd yields not the palm to any poet of his class throughout the world, and though his influence is still a potent factor in the literature of Wales, we are certain of hardly a single fact about his life. He flourished between 1340 and 1390. His works were published in London in 1789. This edition was reprinted by Ffoulkes of Liverpool in 1870. See L. C. Stern, Zeitschr. f. Celt. Philol. vol. vii.

Sion Cent was chaplain to the Scudamores of Kentchurch in Herefordshire, and though, therefore, in orders, was a most bitter opponent of the pretentious and frivolous life of the monks. He lays stress upon how slight an influence of the morалиsts of the middle ages, and treat of religious or of moral subjects. His poetry is strong and austere, interfused here and there with the most biting satire. He died about 1400. Like many of his contemporaries, Dunbar, Villon, Menot and Manrique, his dominant note is that of sadness and regret.

Rhys Goch Eryri had a sprighty mirth which deals with fanciful subjects. His themes are simply natural objects which he treats in a vigorous but narrow and cold manner.

Iolo Goch, that is, Iorwerth the Red, deserves a special mention as the poet who voiced the aspirations of a new Wales when Owen Glyndwr began to rise into power, and it is to one of his poems that we owe a most minute description of Sycharch, Owen Glyndwr's home. His poetry is slightly more archaic in diction than that of his contemporaries, as his subject—war and the glory of Welsh heroes—belonged more properly to the age before his own. In one very striking cywydd composed after Glyndwr's downfall, he charges his own failing on himself, his influence, and treat of religious or moral subjects. His poetry is strong and austere, interfused here and there with the most biting satire. He died about 1400. Like many of his contemporaries, Dunbar, Villon, Menot and Manrique, his dominant note is that of sadness and regret.

poetry is not necessarily a striving after the uncommon as it too often is in English.

There are some poets included in this period who belong more properly to the last, but even these show signs of the attempt at correctness and distinction which was supplanting the old simplicity. Ieuan ap Rhydderch ab Ieuan Llwyd, who is supposed to be a brother of the Llio Rhydderch of Dafydd Namnor’s poem, is the author of some cywyddau and other poems addressed to the Virgin, the structure of which shows great skill accompanied by force and clearness. He flourished about 1435. Dafydd ab Meredydd ap Tudur, who flourished about 1420, is the author of a cywydd “to Our Saviour.” About the same time lived Rhys Namnor, Ieuan Gethin ab Ieuan, and Ieuan Llwyd ab Gwilym. Among the earliest of the poets who belong properly to this period is Meredydd ap Rhys, whose cywyddau are a fair specimen of the generality of poems written in these years. Among the most famous of his works is a cywydd “begging for a fishing-net,” and another giving thanks for the same. We shall find that many of his contemporaries were able to write long and interesting poems on such seemingly dry and uninteresting subjects, but it is vain to look for anything beyond good verse in such compositions.

Of poetry, as generally understood, there was none.

The composition figures in the Welsh is, of course, Dafydd ab Edmwnd, who was a disciple of Meredydd ap Rhys. He bears somewhat the same relation to his contemporaries as Dafydd ab Gwilym does to his, and to strain an analogy, we might say that as Dryden was to Milton, so Dafydd ab Edmwnd was to Dafydd ab Gwilym. He was regarded by his contemporaries as the greatest poet that North Wales had ever produced, and some would set him up as a rival even to Dafydd ab Gwilym himself. He would probably have produced much greater poetry had he understood that the cywydd and the other metres were strait and shackled enough without the cymeriadau and other devices which he introduced, or at least sanctioned and made popular. He begins many of his cywyddau and odes with the same letter; he is the chief among Welsh formalists, but in spite of his self-imposed restrictions he is a great poet also. His most famous poems are three Cywyddau Merch o’r Poems to a Lady,” and his Cywydd i Wallt Merch, “cywydd to a lady’s hair.” He is the author of the lines already quoted: “thy brow,” he sings, “is as the show of yesternight, the shine of the other day.” He died about 1410. Dafydd ab Edmwnd’s disciples were Gwyn Owain and Tudur Aled, who was also his nephew. Gwyn Owain lived about 1420 and 1450, and was one of the men appointed by the king’s commissioners to trace, or perhaps to manufacture, the Welsh pedigree of Henry VII. He belonged entirely to the school inaugurated by Dafydd ab Edmwnd, and though he was by no means wanting in imagination, the highest distinction of his verse is its intricacy of form and very often the felicity of his couplets.

Just as the rise of Owen Glyndwr in the beginning of the century had given a new impulse and a new interest to poetry, so in 1485, when Henry VII.—the “little bull” as he is called by the poets—ascended the throne of England, a particular kind of poetry called brud, half history and half prophecy, became popular, and we have in the manuscripts writing of this description, a good deal of it worthless as poetry. Occasionally, however, some of these “bruts” may claim to be called poetry, especially the compositions of Robin Ddu o Fon, who wrote poems in praise of the Tudors and hailed them as the deliverers of the nation. His poems were mostly about the streets, Caerwysin and Plas Lwyelyn, whose works deserve to be much better known than they are at present. One of the best cywyddau among his works is the “Address to the Raven,” to whom he promises a rich royal feast when the hero whom all Wales is expecting has met his royal enemy. Tudur Aled, too, was a zealous partisan of Henry VII. and wrote many cywyddau in praise of Sir Rhys ap Thomas, the great champion of Henry’s cause in South Wales. He is also famous as having supplemented and made a new recension of Dafydd ab Edmwnd’s rules of poetry in the eisteddfod held at Caerwys in 1534. Tudur Aled has always been more widely known in Wales than almost any other of the earlier poets except Dafydd ab Gwilym. This is perhaps due to the quotability and sententiousness of his couplets. There is a certain refreshing dryness about his poetry which partly makes up for his want of imagination. One of the most interesting poets of this century is Lewis Glyn Cothi, who lived between 1410 and 1490. During the Wars of the Roses he was a zealous Lancastrian, and his bitterer enemies were the men of Chester, who had treated him scurvily while he was there in hiding, and his awdl, satirizing the men of that city, is one of the most vigorous compositions in the language. Indeed, among so many cywyddau of this period in conventional praise of different patrons, it is most refreshing to find such an outburst of sincere personal feeling, boldly and fiercely expressed. He wrote an awdl also rejoicing in the victory of Henry VII. Most of his work, however, consists of cywyddau mawr—praise of patrons—containing weary and unpictorial pedigrees. Gruffydd Hiraethog, who flourished about 1450, was a disciple of Tudur Aled. A fierce poetical dispute raged between him and Sion Brywynog of Anglesey, who was a contemporary of his. About this time there were many poets in Wales who were imitators of Dafydd ab Gwilym, and who did not follow implicitly the lead of Dafydd ab Edmwnd, like those whom we have mentioned. Much of their poetry is feeble, but Bedo Brywynnog especially stands out from among the rest, and his poetry, though highly imitative and often over fanciful, is of a much higher order than the genealogical poems of Lewis Glyn Cothi and others. In the same way the only poem of any merit of Ieuan Denlyw printed in the Gorshesion is written in this imitative strain. Other poets of the middle of this period are Deio ap Ieuan Du, Iorwerth Fynglyw, Lewys Morganwg, Ieuan Bryddyd Hir, and Tudur Penllyn, who wrote a superb cywydd to Dafydd ab Siencyn, the outlaw.

Towards the end of the period we begin to breathe a literary atmosphere that is gradually but surely changing,—it is the change from the misty Wales of Roman Catholic times to the modern Wales after the Reformation. The poetical incoherences of the old metres and the tricks of fancy of the old stylists occasionally form a somewhat incongruous dress for the thoughts of later poets. The old spirit and the glamour are gradually wearing away, only to be momentarily revived in the poetry of Gwilym Owen, nearly two centuries later. Two or three figures, indeed, stand out prominently during these years, among whom are some of the bards ordained penceredigion (master-poets) in the second Caerwys Eisteddfod held in 1568, viz. William Llyn, William Cynwal, Sion Tudur, and Sion Phylip. William Llyn (1532-1580) was a pupil of Gruffydd Hiraethog. His complicated awdlau are marvels of ingenuity, but many of them are on that very account almost unintelligible. He was, however, a complete master of the cywydd, in which he sometimes displays a sense of style and a sweetness of imagery allied to a melodiousness of language unequalled by the other poets of the period. His best-known work is the famous mawnwd to his master, Gruffydd Hiraethog. Sion Tudur (d. 1622), also a disciple of G. Hiraethog, was connected in some capacity or other with the cathedral at St Asaph. He is a realist, and delights in giving vivid word pictures in a less fanciful strain than his predecessors. Sion Phylip (1543-1629) wrote a famous mawnwd to his father and a cywydd “to a sea-gull,” which is a superb piece of nature-painting in the style of Dafydd ab Gwilym. While dealing with this second Eisteddfod at Caerwys, we may mention Fychan’s “Laws of Poetry” were accepted at this festival.

Two poets of this period, whom an English writer describes as “the two fithly Welshmen who first smoked publicly in the streets,” were captains in Queen Elizabeth’s navy, viz. Thomas Prys (d. 1634) of Plas Iolyn, and William Myddleton (1558-1621), called in Welsh Gwilym Canolfre. The former wrote, among other things, humorous cywyddau descriptive of life in London and in the English navy of those days, in a style which was afterwards attempted by Lewys Morys. The work of...
Myddleton, by which he is best known, is his translation of the Psalms (1603) into Welsh cywydd metre, a difficult and profitless experiment.

With Edmund Prys (1541–1624), the famous archdeacon of Merioneth, we come to distinctly modern times. He is hardly a great poet, if we judge him by the canons which are now popular. His gift was a gift of terse and biting statement, and his cywyddau on the whole have more of literary than of poetical merit. He was a man of vast learning, and his works are full of scholastic and often difficult allusions. His most famous cywyddau are those written in the literary quarell between him and William Cynwal. "William Cynwal," says Goronyw Owen, "though the greater poet, was like a man fighting with bare fists against complete armour," and it may be freely granted that in this, the most famous quarell in Welsh literature, the palm of victory rested with the contentious old ecclesiast. We shall deal with the rest of Edmund Prys's literary work in the section on the rise of popular poetry.

Here the age of the cywydd and the awdl, as the chief forms of verse, ends. They appear again in the succeeding centuries, but as aliens among a nation that no longer paid them homage. The distinctly Welsh fashion in song was dying out. The 1550s and 1560s were the striking features of Welsh literature is the almost entire absence of verse between 1300 and 1550. The genius of the people has always been an eminently poetical and imaginative one, and the history of Wales, politically and socially, has always been a fit subject for poetry than for prose. During this period, Wales enjoyed a rest from propagandists and revolutionaries which has seldom been the happy lot of any other nation—they lay content with their own old traditions, acquiescing proudly in their separation from the other nations of Europe, and in their aloofness from all the movements which shook England and the continent during those years. Dynasties came and went, one religion ousted another religion, a new learning exposed the absurdities of the old, but the Welsh, among their hills, knew nothing of it; and when new ideas began to brood over the consciousness of the nation, they never got beyond the stage of providing new subjects for cywyddau. The Peasant Revolt, for instance, had but little effect on Welsh history, its most important contribution to the heritage of the nation being Iolo Goch's superb "Cywydd to the Labourer." But when, after the Reformation, which stripped to change the whole fabric of Welsh literature, had little effect on that of Wales, and the age of the cywydd dragged out hourly its last years without experiencing the slightest quickening from the great movement which was remaking Europe. Hardly a prophet or reactionary raised his voice in defence or condemnation, and the Welsh went on serenely making and reading poetry. The two political movements in which Wales was really interested—the revolt of Glyndwr and the accession of Henry VII., paid their tribute to its poetry alone, and both enterprises had sufficient of romance in them to repel the historian and to capture the poet. Naturally, therefore, we have no prose in this period, because there was no cause strong enough to produce it. What prose the nation required they found in the tales of romance, in the legends of Arthur and Charlemagne and the Grail, and, for pedigrees and history, were they not written in the cywyddau of the poets?

The little prose that was produced during this period (1500–1550) was of an extraordinary kind. It was simply an exercise in long sentences and in curious but compact, and therefore more nearly allied to poetry. It generally took the form of devisi-bethau, a list of the "choice things" of such and such a person, or of the later triads (trioedd), which, starting from an ancient nucleus, gradually grew till, at the present day, Wales has a gnomic literature out of all proportion to the rest of its prose. Modern Welsh prose, however, is only very indirectly connected with these compositions. It is almost altogether a product of the Biblical literature which began to appear after the Reformation, and we shall proceed to give here the main facts and dates in its development. The first Welsh book was printed in 1546. It consisted of extracts in Welsh from the Bible and the Prayer Book, and a calendar. The author was Sir John Prys (1502–1555). The most important name in the early part of this period is William Sylas (1528–1602). His chief books were, A Dictionary in English and Welsh (printed in 1547, and published in facsimile reprint by the Cymmrodorion Society), Kyffin Llig o Blaen (1551), the Prayer Book in Welsh (1567), and the most important of all his works, the translation of the New Testament (1567). It is difficult to form any estimate, at this distance of time, of the impetus which William Sylas gave to Welsh prose, but it must be regretfully admitted that his great work was marred by many defects. He had a theory that Welsh ought to be written as much like Latin as possible, and the result is that his language is very poor Welsh, both in spelling and idiom; it is an artificial dialect. It is a striking testimony, however, to his influence that many of the constructions and words which he manufactured are found to this day in correct literary Welsh.

In 1567 was published a Welsh Grammar by Dr Gruffydd Roberts, a Roman Catholic priest living at Milan (reprinted in facsimile, Paris, 1883), and in 1583, under the direction of Dr Rhosier Smyth, his Drefs Cristionganzau was published at Rouen. Many other important Welsh books were produced during these years, but the work of the century was the translation of the New Testament. Its greatest influence on the subsequent literature of Wales was the translation of the Welsh Bible (1588) by Dr William Morgan (1547–1604), bishop of Llandaff, and afterwards of St Asaph. The Authorized Version (1610) now in use is a revision of this work by Dr Richard Parry, bishop of St Asaph (1560–1623).

In 1592 the Welsh Grammar of Sion Dafydd Rhydys (1554–1609) was published—a most valuable treatise on the language and on the rules of Welsh poetry. It was followed in 1621 by the Welsh Grammar, and in 1632 by the Welsh Dictionary of Dr John Davies o Ffaldy (1570–1644).

There are two prose compositions which stand entirely by themselves in this period of Bibles and grammars—the History of Ellis Gruffydd, and Morris Kyffin's Deffnydd y Ffyllydd. The former was a soldier in the English army during the reign of Queen Elizabeth, and wrote a long history of England from the earliest times to his own day. This document, which has never been published, and which lies hidden away among the Mostyn MSS., is a most important and valuable original contribution to the history of the author's contemporaries, and it sheds considerable light on the relations of the Welsh to England. The latter is written in a delightfully easy style, contrasting favourably with the stiff diction of this period of translations. The work of Morris Kyffin (1555–1599) which we have mentioned is a translation of Bishop Jewel's Apologia Ecclesiae Anglicanae (1562) and was published in 1595. This work is the first piece of modern Welsh prose within reach of the ordinary reader, written in the rich idiom of the spoken Welsh. It is a precursor of many other books of its kind, a long series culminating in the immortal Bardd Cacc. In this sense Morris Kyffin may with perfect justice be hailed as the father of modern Welsh prose.

Most of the works which were afterwards written in the strong idiomatic Welsh of Morris Kyffin were on religious subjects, and many of them were translated from the English. The first was Ymarfer o Ddwiwioed (1630) by Rowland Vychan o Gargaith (a translation of Bailey's Practice of Pity), which was followed in 1632 by Dr John Davies's Llryf y Resolution, and in 1650 by Hanes y Ffyllydd Daiw (A History of the True Faith) by Charles Edwards. All these authors and many of their successors were strong adherents of the Established Church, which was then intensely Welsh in sentiment. But in the midst of these churchmen, a flame-bearer of dissent appeared—Morgan Llwyd o Wynedd, who published in 1653 "a mystery to be understood of some, and scorned of others"—Llryf y Tri Aderf y (The Book of the Three Birds). It is in the form of a discussion between the eagle (Cromwell), the dove (Dissent) and the raven (the Established Church). This book is certainly the most important original composition published during the 17th century, and to this day remains one of the widely-read classics of the Welsh
tongue. Morgan Llwyd wrote many other books in Welsh and English, all more or less in the vein of the first book.

During the remaining years of this period, the prose output of the Welsh poets was mainly of devotional books, written or translated for or at the instigation of the Society for Promoting Christian Knowledge. The Established Church, with the help of this society, made a gallant attempt to lighten the darkness of Wales by publishing books of this description, and it is likewise due to the exertions that the lamp of Welsh prose was kept burning during these years. Among the clergy who produced books of this description were Edward Samuel (1674–1748), who published among other works *Holl Ddyledrywdd Dyn,* a translation of *The Whole Duty of Man* (1718); Moses Williams (1684–1742), a most diligent searcher into Welsh MSS. and translator; Griffith Jones of Llanddowror (1683–1761), the father of Welsh popular education; Iago ab Dewi (1644–1722) and Theophilus Evans (1694–1769), the famous author of *Dyrych y Prif Oesoed* (1716 and 1740). This book, like *Llyfr y Tri Aderyn* and *Y Bardd Cwsc,* has an established position for all time in the annals of Welsh literature.

We come now to the greatest of all Welsh prose writers, Ellis Wyn o Lasyns (1671–1734). His first work was a translation of Jeremy Taylor’s *Holy Living,* under the title of *Rhewl Buesedd Sancadiod.* (1701). His next work was the immortal *Gwetiedgochau y Bardd Cwsc* (1703). The foundation of this work was *L’Estrange’s* translation of the *Suenos de Syria.* This Wyn was certainly followed his original closely, even as Shakespeare followed his, but by his inimitable magic he has transmuted the characters and the scenery of the Spaniard into Welsh characters and scenery of the 17th century. No writer before or after him has used the Welsh language with such force and skill, and he will ever remain the stylist whom all Welsh writers will strive to imitate. The magic of his work has endowed the stately idiom of Gwynedd with such glamour that it has now become the standard idiom of Welsh prose. See Stern, *Z. f. Celt. Phil.* iii. 165 ff.

7. The Rise of Popular Poetry, 1600–1750.—When Henry VII. ascended the throne, the old hostility of the Welsh towards the English disappeared. They had realized their wildest hope, that of seeing a Welshman wearing “the crown of London.” Naturally enough, therefore, the descendants of the old Welsh gentry began to look towards England for recognition and preferment, and their interest in their own little country necessarily began to wane. The result was that the traditional patrons of the Welsh muse could no longer understand the language of the poets, and the poets were forced to seek some other more profitable employment. Besides, the old conditions were changing; the medieval traditions were indeed dying hard, but it gradually and imperceptibly came about that the poets of the older school had no audience. The only poets who still followed the old traditions were the rich farmers who “sang on their own land,” as the Welsh phrase goes. A new school, however, was rising. The nation at large had a vast store of folk-poetry, full of all the poetical characteristics of the Celt, and it was this very poetry, despised as it was, that became ultimately the groundwork of the new literature.

The first landmark in this new development was the publication in 1621 of Edmund Pye’s metrical version of the Psalms (followed by later editions in 1628, 1630, 1638 and 1648), and of the first poem of the *Welshmen’s Candle* (Cannwyll y Cymry) of Rhys Pritchard, vicar of Llandovery (1569–1644). This was published in 1646. These works were not written in the old metres peculiar to Wales, but in the free metres, like those of English poetry. The former work is of the utmost importance, as these Psalms were about the first metrical hymns in use. They are often rugged and uncouth, but many of the verses—such as the 23rd Psalm—have a haunting melody of their own, which grips the mind once and for ever. The second work, the first complete edition of which was published in 1672, consisted of moral verses in the metres of the old folk-songs (*Penillion Telyn*), and for nearly two centuries was the “guide, philosopher and friend” of the common people. Many other poets of the early part of this period wrote in these metres, such as Edward Dafydd o Fargam (fl. 1640), Rowland Fychan, Morgan Llwyd o Wynedd and William Phypil (d. 1676). Poetry in the free metres, however, was generally very crude, until it was given a new dignity by the greatest poet of the period, Huw Morus o Bont y Melian (1622–1709). Most of his earlier compositions, which are among his best, and which were influenced to a great extent by the cavalier poetry of England, are love poems, perfect marvels of felicitous ingenuity and sweetness. He fixed the poetical canons of the free metres, and made what was before homely and uncouth, courtly and dignified. He wrote a *cywydd marwlad* to his contemporary, Edward Morus o’r Perthi Llydwyd (d. 1689), who was also a poet of considerable merit. Most of his work is composed of “moral pieces” and carols. Other poets of the period were Sion Dafydd Las (1650–1691), who was among the last of the family bards, and Dafydd Jones o Drefriw (fl. 1750). Towards the end of the period comes Lewys Morys (1700–1765). His poetry alone does not seem to warrant his fame, but he was the creator of a new period, the inspirer and the patron of Goronwy Owen. According to the lights of the 18th century, he was, like his brothers Richard and William, a scholar. His poetry, except a few well-known pieces, will never be popular, because it does not conform to modern canons of taste. His greatest merit is that he wrote the popular poetry then in vogue with a scholar’s elegance.

7. The Revival, 1717–1790. The two leading figures in this period are Goronwy Owen (1719–1790) and William Williams, Pantycelyn (1717–1791). Goronwy Owen wrote all his poetry in the *cynganedd,* and his work gave the old metres a new life. He raised them from the neglect into which they had fallen, and caused them to be, till this day, the vehicle of half the poetical thoughts of Wales. But he was in no way a representative of his age; he, like Milton, sang among a crowd of inferior poets themes quite detached from the life of his time, so that he also, like his English brother, lacks “human interest.” After Dafydd ab Gwilym, he is the greatest poet who sang in the old metres, and the influence of his correct and fastidious muse remains to this day. William Williams, however, wrote in the free metres in a way that was astoundingly fresh. It is not enough to say of him that he was a hymnologist; he is much more, he is the national poet of Wales. He had certainly the loftiest imagination of all the poets of five centuries, and his influence on the Welsh people can be gauged by the fact that a good deal of his idiom and dialect has fixed itself indelibly on modern literary Welsh. Besides the hymns, he wrote a religious epic, *Theomemhus,* which is to this day the national epic of evangelical Wales. Even as Goronwy Owen is the father of modern Welsh poetry in the old metres, so William Williams is the great fountain-head of the free metres, because he set allame the imagination of every poet that succeeded him. With two such pioneers, it is natural that the rest of this period should contain many great names. Thomas Edwards (Twm o’r Nant) (1739–1810) has been called by an unwarrantably bold hyperbole, “the Welsh Shakespeare.” Most of his works are interludes and ballads, and he used to be very popular with the common people; he is, to this day, probably the oftest quoted of all the Welsh poets. William Wynn, rector of Llangynhafal (1704–1760), is the author of a “Cywydd of the Great Judgment,” which bears comparison with Goronwy Owen’s masterpiece. Evan Evans (Teuan Bryddyd Hir) (1731–1789) was famous both as a poet and as a scholar and antiquarian. Edward Rhisiart (1714–1777), the schoolmaster of Ystradmeurig, was a scholar and a writer of pastoral in the manner of Theocritus. Most of the other poets who flourished towards the end of this period—Dafydd Ddu Eryri (1760–1832), Gwaltar Mechain (1761–1849), Robert ab Gwilym Ddu (1767–1839), Dafydd Ionawr (1751–1827), Dewi Wyn o Eifion (1784–1841)—were brought into prominence by the Eisteddfod, which began to increase in influence during this period until it has become today the national festival. They all wrote for the most part in *cynganedd,* and the work of nearly all of them is marked by correctness rather than by poetical inspiration.
9. Prose after 1836.—In the preceding periods, we have seen that Welsh prose, though abundant in quantity, had a very narrow range. Few writers rose above theological controversy or moral treatises, and the human side of literature was almost entirely neglected. In this period, however, we find a prose literature that, with the exception of scientific works, is, in a large sense, as that of England, and all departments are well and competently represented, though by by few names. Dr Lewis Edwards (1806–1887) struck a new note when he began to contribute his literary and theological essays to the periodicals, but, though many have equaled and even surpassed him as the theological essayists, few, if any, of his followers have attempted the literary and critical essays on which his fame as writer must mainly rest. Together with Gwilym Hiraethog (1802–1883), the author of the inimitable Llythrym Hen Ffarmor, he was regarded as the pioneer of the new literature. Samuel Roberts (1800–1887), generally known as S.R., wrote numerous tracts and books on politics and economics, and as a political thinker he was in many respects far in advance of his English contemporaries. It was in this period, too, that Wales had her national novelist, Daniel Owen (1796–1866). He was a novelist of the Dickens school, and his chief work was the depiction of the Welsh peasantry, rather than fiction. He has created a new literary atmosphere, in which the characters of Puritanical and plebeian Wales move freely and without restraint. He can never be eclipsed just as Sir Walter Scott cannot be eclipsed, because the Welsh which he describes is swiftly passing away. He has many worthy disciples, among whom Miss Winnie Parry is easily first. Indeed, in her finer taste and greater firmness of touch, she stands on a higher plane than even her great master. The inspiring genius of the latter part of this period is Owen M. Edwards (b. 1818), and, as a stylist, all writers of Welsh prose since Ellis Wynne have to concede him the laurel. His little books of travel and history and anecdote have created, or rather, are creating a new school of writers, scrupulously and almost pedantically careful and correct, an ideal which, on its philological side is the outcome of the scientific study of the language as inaugurated by Sir John Rhŷs and Professor Morris Jones. One of the earliest, if not the ablest writer of this “new Welsh” was the independent and original Emrys ap Iorwerth (1820–1896), who, in 1870, was awarded the Smith’s Prize. Poetry after 1836.—The origins of this period are really placed in the last period. Its great characteristics are the development of the lyric, and the influence of English and continental ideas. Just as the cywydd was among the older writers the favourite form of poetry, so the lyric becomes now paramount, almost to the exclusion of other forms. The first great name, after those already mentioned in the development of this form of poetry, is that of Anna Griffiths (1776–1805). Her poetry is exclusively composed of hymns, but to the English mind, the word “hymn” is entirely inadequate to give any idea of the passion, the mysticism and the rich symbolistic grace of her poems. She gave to the Welsh lyric the depth and the rather melancholy intensity which has always characterized it. Evan Evans (Ieuan Glyn Geirionydd) (1795–1855) was also a hynnolog, but he wrote many secular lyrics and awdlau—all among the former being the famous Morfa Rhuddlan. Ebenezer Thomas (Eben Farold) (1802–1863) was a famous Festadodfwr; his best work is his awdlau, and no one will deny him the distinction of being the master of the awdl in the 19th century. Gwilym Cawrdaf (1795–1848), also a writer of awdlau, has the gift of simple and direct expression, well exemplified in Hiraeth Cymro am ei wlad. Daniel Ddu (1792–1846) was a scholar who wrote some touching lyrics and hymns. Gwilym Hiraethog (1802–1858) attempted an epic, Emmuniel, with indifferent success. His shorter works and some of his awdlau are of a much higher order. Caledryd (1801–1869) was a direct successor of Dewi Wyn and the earlier writers of awdlau, but his Drylliaid y Rhydddau Castle is superior to anything which his master wrote. Similar in genius, though not on quite as high a plane, were Nicander (1809–1874), Cynddelw (1812–1875), Gwchmai (1823–1897) and Tudno (1844–1895).

John Blackwell (Alun) (1797–1840) was a lyricist of the first order. With Ieuan Glyn Geirionydd, he is the pioneer of the secular lyric of the 19th century. Succeeding to the mantle of these lyricists, we have another later group, Ceirig (1832–1887), Talhaiaro (1833–1879) and Myndogd (1833–1877), who certainly had the advantage over their predecessors in freshness, in vigour and in human interest, but they lacked the scholastic training of the earlier group, and so their work is often uneven, and cannot therefore be fairly compared with that of the earlier poets. Ceirig, of course, is the greater name of the three, and is to Wales what Robert Burns was to Scotland, sharing with him his poetical faults and merits. He is called the national poet of Wales, because he was the first to sing of the land and the nation he knew, and he cast the glamour of his genius over the life of the gwerin, the peasants of Wales.

Somewhat higher flights were essayed by Gwilym Marles (1834–1879) and Islwyn (1835–1875). Their poetry is Wordsworthian and mystical, and well exemplifies the love of metaphysics and speculation which is growing in Wales. Islwyn’s Ystorn, though uneven, is full of powerful passages, and he was a master of blank verse. Of the remaining poets of the period Robert Williams, Iolo (1801–1869), described in the Rev. Elvet Lewis in the last generation, and Elion Wyn in the younger—both writers of lyrics. Other lyrical poets of the first class are Gwilya and Silyn Roberts. In the old metres, two poets stand out prominent above all others—J. Jones Morris and T. Gwynn Jones. The Awdu i Ffamyn of the former, and the Ymadawid Arthur of the latter, gave reason to believe that Welsh poetry was only entering on its golden period.

V. Breton Literature.—Unlike the literature of Wales, the literature of Brittany is destitute of originality, and we find nothing to compare with the Mallorinian. Till the 19th century all the monuments which have come down to us are copies of French models, though the retention down to the 17th century of that intricate system of versification found in Welsh and Cornish may indicate that what was really Breton in spirit has not been preserved (v. J. Loth, La Metrique galloise, ii. 177-203). It is usual to divide the literature into three periods in conformity with the language in which the monuments are written—Old, Middle, and Modern Breton. No connected monuments of the first period (8th to 11th centuries) have come down to us.

For our knowledge of the language of this period we must have recourse to the manuscripts containing glosses and the names occurring in ancient documents. The chief collections of glosses are (1) the Oxford glosses on Eutychius; (2) the Luxembourg glosses; (3) the Bern glosses on Virgil; (4) the glosses on Amalarius (Corpus Christi, Cambridge); (5) five Collationes Canonum, the chief manuscripts being at Paris and Orleans. All these glosses have been published in full by J. H. Leconte, (Vocabulaire Vieux Breton, Paris, 1884). From a linguistic point of view the Breton names in the Latin lives of saints are very important, particularly those of St Samson, St Paul, Aurelian, St Winwalec, St Ninnoc, St Gildas and St Brieuc. Of even greater value are the names in the Charter of Redon, which was written in the 11th century, but dates largely from the 9th (published by A. de Courage, 1865); we may also mention the Charter of Landevennec (11th century). In the Middle Breton period, which extends from the 11th to the 17th centuries, we are obliged, down to the 15th century, to rely on official documents such as the Charter of Quimperlé. French seems to have been the language of the aristocracy and the medium of culture. Hence the oldest connected texts are either translated or imitated from French, and are full of French words. We might mention a Book of Hours belonging to the 16th century, published by Whitley Stokes, and three religious poems bound up with the Getifolia, or The Book of St Cuthbert, copiously prose (published by Ernault, Revue celtique, vili. 76), translated from the Golden Legend, the Mirror of Death, containing 3360 verses, which was composed in 1549 and printed in 1575, the Mirror of Confession, a translation from the French in prose (1621), the Christian Doctrine, a translation in verse (1622), a collection of carols (An Nouelou ancien, 1650, Rev. celt. vols, x-xiii.) and the Christian Meditations of J. Cadec, 1653 (Rev. Celi, xx. 55).

The earliest Breton printed work is the Catholicion of Jean Lagadec, a Breton-Latin-French dictionary, dated 1464 but printed first in 1499 (reprinted by R. F. Le Men, Lorient, 1867). Modern Breton begins with the orthographical reforms of the Jesuit, Julien Maunois, whose grammar (Le Sacre College de Jesus) and dictionary appeared in 1659. Throughout the modern period we find numerous collections of religious poems and manuals of devotion in prose and verse, which we cannot here enumerate. But the bulk of Breton literature before the 19th century consists of mysteries and miracle plays. This class of literature had a tremendous vogue in Brittany, and the native stage was only killed about 1850.
Hersart de la Villemarqué (1815-1895), who issued in 1839 his famous collection of ballads entitled *Barzas Breiz*, but which cannot be regarded as an anthology of Breton popular poetry. The publication of this work gave rise to a controversy which is almost as famous as that caused by Macpherson's forgeries. De la Villemarqué was endowed with considerable poetic gifts, and, coming as he did at a time when folk-poetry was the fashion, he determined to collect the popular literature of his own country. However, he was not content to publish the poems as he found them circulating in Brittany. With the aid of several collaborators he transformed his material, eliminating anything that was crude and gross. The poems included in his collection may be divided into three classes: (1) Poems rearranged by himself or others. (2) Modern poems transferred to medieval times. (3) Spurious poems dealing with such personages as Nominoe and Merlin. The compiler of the *Barzas Breiz* unfortunately laboured under the delusion that these Breton folk-songs were in the first instance the work of medieval bards corresponding to Taliesin and Llywarch Hen in Wales, and that it was possible to make them appear as such; a misapprehension of the nature of the collection indicates the artificial nature of the contents. For *Barzas* (in the 2nd edition of 1869 spelt *Barzaz*) is not a Breton word at all but is formed on Welsh *barddas* (bardic poems). For the whole controversy the reader may consult H. Gaidoz and P. Sébillot, "Bibliographie des traditions et de la littérature populaire de la Bretagne" (*Revue Celtique*, v. 277 ff., and G. Dottin in the *Revue de synthèse historique*, v. 95 ff.). In Brittany it is usual to divide the popular poetry into *gwérisioù* and *soniou*. The *gwérisioù* (complaints) deal with local history, folk-lore, religious legends and superstitions, and are in general much more original than the other class. The *soniou* consist of love-songs, satires, carols and marriage-lyrics, as well as others dealing with professional occupations, and seem in many cases to show traces of French influence. The first scholar who published the genuine ballad literature of Brittany was F. M. Luzel, who issued two volumes under the title of *Guerisioù Breiz-Izel, chants populaires de la Basse-Bretagne* (Lorient and Paris, 1868, 1874). This collection contains several of the originals of poems in the *Barzas Breiz*; Luzel is also the author of a collection of Breton tales in French translation, *Contes bretons recueillis et traduits par F. M. Luzel* (Quimper, 1870). The same author published *Les Légendes chretiennes de la Basse-Bretagne* (Paris, 1881) and *Veillées bretonnes, mœurs, chants, contes et récits populaires des Bretons Armoricains* (Morlaix, 1879). Another indefatigable collector of Breton legends is Anatole Le Braz, who was commissioned by the minister of public instruction to investigate the stories current of reference to *An Ankou* (death). Le Braz's results are to be found in his *La Légende de la mort* (1902). A well-known collection of stories with a French translation was issued by the lexicographer Troude under the title of *Ar marveller breznik* (Brest, 1870), and one of the most popular books at the present day is *Pipi Gont*, by A. Le Moal (St Brieuc, vol. i. 1902, vol. ii. 1908). A recent collection of stories with a religious tendency is C. M. Le Prat's *Marvaudon ou Vretoulo* (Brest, 1907). The modern movement, which started in the nineties of last century, has already produced numerous dramas and volumes of lyrics, and it may now be affirmed in all sincerity that this is producing something really national. The scope of the writers of the earlier movement was very limited and little originality was displayed in their productions. The literary output of the last ten years in Brittany may truly be termed prodigious, and much of it reaches quite a high level. The dramas which are being produced are mainly propagandist in the interests either of the Union Régionaliste Bretonne or of temperance reform. These are for the most part very crude, but they have been received with great enthusiasm, and this has led to the revival of the old mysteries, though in a somewhat modified form. The foremost living writer is Fanch Jaffrennou, who writes under the name of "Toldiv" (Brow of Steel) and is the author of two very striking volumes of lyrics—*An Hirvouñouk* or *Sigs* (St Brieuc, 1899) and *An Dilern Dir* or *The Harp of Steel* (St Brieuc, 1900). The latter is the most interesting outcome of the modern movement. Among other poets we may mention N. Quellen, *Annañ*, *Aon*, Paris, 1880; *Brez, Polésies bretonnes*, Paris, 1898, Erwan Berthou (Dre an Delen hur ar c'horn-boud, *Par la harpe et par le cor de guerre*, St Brieuc, 1904). C. M. Le Prat, who writes under the name of Kroada (*Mouez Reier Plougastel*, "The Voice of the Cliffs of Plougastel," St Brieuc, 1905); J. Cuillandre (*Mouez an Aochou, La Voix des grèves, Rennes, 1903), abbé Lec'hvinen, *Gwériou ha soniou* (St Brieuc, 1900), and, further, two anonymous volumes of verse, *An Tremener, Gwériou ha soniou* (Brest, 1900), and *Kanaouennou Kerne* (Brest, 1900). Two older collections are by Dottin—*J. Cadiou, En Breiz-Izel* (Morlaix, 1885) and *Izoune* (Morlaix, 1886). An anthology of latter-day lyrics appeared at Rennes in 1902 under the title of *Blenniout Breiz-Izel, Dibab Baronienou*.

Of the numerous plays those most deserving of mention from a literary point of view are perhaps *Ar Vezent* by T. le Garrec; the comedy *Alanik al Lowarn* by J. M. Perrot (Brest, 1905) based on the farce of Pathelin; Tanguy Malmanche, *Le Conte de l'homme qui a faim*, in which Breton superstitions are combined with the spirits of the dead are introduced with strange effect; J. le Bayon, *En Eutru Keriiolet* (Vannes, 1902), which deals with the life and death of a blaspheming Breton nobleman of the early part of the 17th century; F. Jaffrennou, *Ponkalik* (Brest, 1903), which tells of the betrayal of a noble Breton who was put to death by the French in 1720; and the farce *Eur Pesk-Ebled* by L. Rennadis (Morlaix, 1900).

**VI. CORNISH LITERATURE.**—The literature of Cornwall is more destitute of originality and more limited in scope than that of Brittany, and it is remarkable that the medieval drama should occupy the most prominent place in both. The earliest Cornish we know consists of proper names and a vocabulary. About 200 Cornish names occur among the manumissions of serfs in the Bodmin Gospels (10th century). They were printed by Whitley Stokes in the *Revue Celtique*, i. 232. Next comes the Cottonian Vocabulary, which seems to follow a similar Anglo-Saxon collection and is contained in a 12th-century MS. at the British Museum. It consists of seven pages and the words are classified under various headings, such as heaven and earth, domestic parts of the human body, birds, trees, herbs, ecclesiastical and liturgical terms. At the end we find a number of adjectives. This vocabulary was printed by Zeuss, p. 1065, and again in alphabetical order by Norris in the *Ordinale*. The language of this document is termed Old Cornish, although the forms it contains correspond to those of Mid. Welsh and Mid. Breton.

The first piece of connected Cornish which we know consists of a poem, or portion of a play (?), of forty-one lines discovered by Jenner in the British Museum. This fragment was probably written about 1400 and deals with the subject of marriage (edited by W. Stokes in the *Revue Celtique*, iv. 258). A little later is the *Poem of Mount Calvary or the Passion*, of which five MSS. are in existence. The poem has been twice printed, ·
first by Davies Gilbert with English translation by John Keigwin (1824), and again by W. Stokes for the London Philosophical Society in 1862. It consists of 259 stanzas of eight lines of seven syllables apiece, and contains a versified narrative of the events of the Passion made up from the Gospels and apocryphal sources, notably the Gospel of Nicodemus. But the bulk of Cornish literature is made up of plays, and in this connexion it may be noted that there still exist in the west of Cornwall the remains of a number of open-air amphitheatres, locally called plan an guari, where the plays seem to have been acted. The earliest representatives of this kind of literature in Cornwall form a trilogy going under the name of Ordinalia, of which three MSS. are known, one a 15th-century Oxford MS. from which the two others are copied. The Ordinalia were published by Edwin Norris under the title of The Ancient Cornish Drama (Oxford, 1859). The first play is called Origio Mundi and deals with events from the Old Testament down to the building of Solomon’s temple. The second play, the Passio Domini, goes on without interruption into the third, the Resurrecticio Domini, which embraces the Harrowing of Hell, the Resurrection and Ascension, the legend of St Veronica and Tiberius, and the death of Pilate. Here again the pseudo-Gospel of Nicodemus is interwoven between Cornish sources, and under the name of the Legend of the Cross, as the title Ordinalia indicates, these plays are of learned origin and are imitated from English sources. The name of these dramas, quari-mirkle, is a literal translation of the English term miracle play, and Norris shows that whole passages were translated word for word. Many of the events are represented as having taken place in well-known Cornish localities, but apart from this scarcely any traces of originality can be discovered. The same remark holds good in the case of another play, Bevans Meriasek or the Life of St Meriasek. This deals in an incoherent manner with the life and death of Meriasek (in Breton Meriadek), the son of a duke of Brittany, and interwoven with this theme is the legend of St Silvester and the emperor Constantine, quite regardless of the circumstance that St Silvester lived in the 4th and St Meriasek in the 7th century. The MS. of this play was written by “Dominus Hadton” in the year 1504, and is preserved in the Peniarth library. The language is more recent than that of the Ordinalia, and there is a certain admixture of English. The Life of St Meriasek is not far removed from the stage, and at the end of each the spectators are invited to carouse. St Meriasek was in earlier times the patron saint of Camborne, where his fountain is still to be seen and pilgrims to it were known by the name of Meria-sickers. In this play, consequently, we might expect to find something really Cornish. But le Braz has shown that the author of this motley drama was content to draw his materials from Latin and English lives of saints. The story of Meriasek himself was taken from a Breton source and closely resembles the narrative of the 17th-century Breton hagiographer, Albert le Grand. The last play we have to mention is Gwenev an Bys (The Creation of the World), of which five complete copies are known. Two of these are in the Bodleian and one in the British Museum, which also possesses a further fragment. The oldest text was revised by William Jordan of Helston in 1611, but there are indications that parts of it at any rate are older than the Reformation. This play bears a great resemblance to the first part of the Origio Mundi, and may have been imitated from it. It was printed first by Davies Gilbert in 1824 with a translation by John Keigwin and again by W. Stokes in the Transactions of the London Philological Society for 1864. The language shows considerable signs of decay, and Lucifer and his angels are often made to speak English. The only other original compositions of any length written in Cornish are Nebbas Gerriau dro le Cornack (A Few Words about Cornwall), by John Boson (printed in the Journal of the Royal Institution of Cornwall, 1879), and the Story of John of Chy-an-Hur (Ram’s House), a folk-tale which appears in Ireland and elsewhere. The latter was printed in Lhuyd’s Grammar and in Pryce’s Archaeologia. Andrew Borde’s Booke of the Introduction of Knowledge (1542) contains some Cornish conversations (see Archivo f. coll. Lexigraphie, vol. i.), and in Carew’s Survey of Cornwall a number of words and phrases are to be found. Apart from the Cornish preface to Lhuyd’s Grammar, the other remains of the language consist of a few songs, verses, proverbs, epigrams, epitaphs, maxims, letters, conversations, mottoes and translations of chapters and passages of Scripture, the Lord’s Prayer, the Creed, the Commandments, King Charles’s Letter, &c. These fragments are to be found (1) in the Gwahas MS. in the British Museum, a collection ranging in date from 1709 to 1736; (2) in the Borlase MS. (1750); (3) in Pryce’s Archaeologia Cornu-Britannica (1790); (4) in D. Gilbert’s editions of the Poem of the Passion (1826) and the Creation of the World (1827). They are enumerated, classified and described by Jenner in his Handbook.

CELT, a word in common use among British and French archaeologists to describe the hatchets, adzes or chisels of chipped or shaped stone used by primitive man. The word is variously derived from the Welsh cel't, a flintstone (that being the material of which the weapons are chiefly made, though chisels of basalt, flintstone and jade are found); from being supposed to be the implement peculiar to the Celtic peoples; or from a Low Latin word cel'tis, a chisel. The last derivation is more probably correct. The word has come to be somewhat loosely applied to metal as well as stone axe-heads. The general form of stone celts is that of blades approaching an oval in section, with sides more or less straight and one end broader and sharper than the other. In length they vary from about 2 to as much as 16 in. The largest and finest specimens are found in Denmark: one in an English collection being of beautiful white flint 13 in. long, 1 1/2 in. thick and 3 3/4 in. broad. Those found in Denmark are sometimes polished, but usually are left rough. Those found in northwestern Europe are ground to a more or less smooth surface. That some were held in the hand and others fixed in wooden handles is clear from the presence of peculiar polished spaces produced by the friction of the wood. In the later stone adzes holes are sometimes found pierced to receive the handles.

The bronze celts vary in size from an inch to a foot in length. The earlier specimens are much like the stone ones in shape and design, but the later manufactures show a marked improvement, the metal being usually pierced to receive the handles. It is noteworthy that the celtmakers never cast their axes with a transverse hole through which the handle might pass. Bronze celts are usually plain, but some are ornamented with ridges, dots or lines. That they were made in the countries where they are found is proved by the presence of moulds.

A point worthy of mention is the position which stone celts hold in the folk-lore and superstitious beliefs of many lands. In the West of England the country folks believe the weapons fell originally from the sky as “thunderbolts,” and that the water in which they are boiled is a specific for rheumatism. In the North and Scotland they are preservatives against cattle diseases. In Brittany a stone celt is thrown into a well to purify the water. In Sweden they are regarded as a protection against lightning. In Africa they are believed to have magical virtues, the adzes and hatchets, a thread tied round them when placed on hot coals will not burn but will become moist. In Germany, Spain, Italy, the same beliefs prevail. In Japan the stones are accounted of medicinal value, while in Burma and Assam they are infallible specifics for ophthalmia. In Africa they are the weapons of the Thunder-God. In India and among the Greeks the hatchet appears to have had a sacred importance, derived, doubtless, from the universal superstitious awe with which these weapons of prehistoric man were regarded.

See Sir J. Evans’s Ancient Stone Implements of Great Britain; Lord Avebury’s Prehistoric Times (1865-1900) and Origin of Civilisation (1870); E. B. Tylor’s Anthropology, and Primitive Culture, &c.; F. the history of polished stone axes up to the 17th century see Dr Marcel Bandoun and Lionel Bonnemère in the Bulletin de la Société d’Anthropologie de Paris, April-May 1905.
 CELTES—CEMENT

CELTES, KONRAD (1450-1500), German humanist and Latin poet, the son of a virtuoso named Pickel (of which Celtes is the Greek translation), was born at Wipfeld near Schweinfurt. He early ran away from home to avoid being set to his father's trade, and at Heidelberg was lucky enough to find a generous patron in Johann von Dalberg and a teacher in Agricola. After the death of the latter (1485) Celtes led the wandering life of a scholar of the Renaissance, visiting most of the countries of the continent, teaching in various universities, and everywhere establishing learned societies on the model of the academy of Pomponius Lactantius at Rome. Among these was the Sodalitas litterarum Rhenoana or Celtica at Mainz (1491). In 1486 he published his first book, Ars versificandi et caeriminarum, which created an immense sensation and gained him the honour of being crowned as the first poet laureate of Germany, the ceremony being performed by the emperor Frederick III. at the diet of Nuremberg in 1487. In 1497 he was appointed by the emperor Maximilian I. professor of poetry and rhetoric at Vienna, and in 1502 was made head of the new Collegium Poetarum et Mathematicum, with the right of conferring the laureateship. He did much to introduce system into the methods of teaching, to purify the Latin of learned intercourse, and to further the study of the classics, especially the Greek. But he was more than a mere classicist of the Renaissance. He was keenly interested in history and topography, especially in that of his native country. It was he who first unearthed (in the convent of St Emmeran at Regensburg) the remarkable Latin poems of the nun Hrovstiva of Gandersheim, of which he published an edition (Nuremberg, 1501), the historical poem Lignirinus sive de rebus gestis Frederici primi imperatoris libri x. (Augsburg, 1507), and the celebrated map of the Roman empire known as the Tabula Peutingeriana (after Konrad Peutinger, to whom he left it). He projected a great work on Germany; but of this only the Germania generalis and an historical work in prose, De origine, sita, moribus et historia Nartheciae et silvantis, saw the light. As a writer in Latin verse Celtes far surpassed any of his predecessors. He composed odes, elegies, epigrams, dramatic pieces and an unfinished epic, Theodoricus. His epigrams, edited by Hartfelder, were published at Berlin in 1881. His editions of the classics are now, of course, out of date. He died at Vienna on the 4th of February 1508.

For a full list of Celtes's works see Engelbert Klüpfel, De vita et scriptis Conradi Celtis (2 vols., Freiburg, 1827); also Johann Aschbichler, Die früheren Wanderjahre des Conrad Celtis (Vienna, 1869); Hartmann, Konrad Celtis in Nürnberg (Nuremberg, 1899).

CELTIBERIA, a term used by Greek and Roman writers to denote, sometimes the whole north-east of Spain, and sometimes the north-east part of the central plateau of the peninsula. The latter was probably the correct use. The Celtiberi, in this narrower sense, were not so much one tribe as a group of cantons—Arevaci, Pelendones, Berones and four or five others. They were the most warlike people in Spain, and for a long time offered a stubborn resistance to the Romans. Originally Carthaginian mercenaries, they were induced to serve the Romans in a similar capacity, and Livy (xxiv. 49) distinctly states that they were the first mercenaries in the Roman army. They did not, however, keep faith, and several campaigns were undertaken against them. In 179 B.C. the whole country was subdued by T. Sempronius Gracchus, who by his generous treatment of the vanquished gained their esteem and affection. In 153 they again revolted, and were not finally overcome until the capture of Numantia (133). The twenty years' war waged round this city, and its slaughter and destruction by Scipio the Younger (133 B.c.) forms only the most famous episode in the long struggle, which has left its mark in entrenchments near Numantia excavated in 1906-1907 by German archaeologists. After the fall of Numantia, and still more after the death of Sertorius (72 B.C.), the Celtiberians became gradually romanized, and town life grew up among their valleys; Clunia, for instance, became a Roman municipality, and ruins of its walls, gates and theatre testify to its civilization; while Bilbilis (Bambola), another municipality, was the birthplace of the eminently Roman poet Martial. The Celtiberians may have been so-called because they were thought to be the descendants of Celtic immigrants from Gaul into Iberia (Spain), or because they were regarded (cf. Lucan iv. 6) as a mixed race of Celts and Spaniards (Iberians); in either case the name represents a geographer's theory rather than an ascertained fact. That a strong Celtic element existed in Spain is proved both by numerous traditions and by the more trustworthy evidence of place-names. The Celtic place-names of Spain, however, are not confined to Celtiberia or even to the north and east; they occur even in the south and west.

A long description of the manners and customs of the Celtiberi is given in Diodorus (lib. xiii. 33, 34). Their country was rough and unfruitful as a whole (bark was however being chiefly used for the pastures of sheep). Its inhabitants either led a nomadic life or occupied small villages; large towns were few. Their infantry and cavalry were both excellent. In battle, they adopted the wedge-shaped formation of the column. They carried double-edged swords and short daggers for use hand to hand, the steel of which was hardened by being buried underground; their defensive armour was a light Celtic shield or a round wicker balek, and greaves of felt round their legs. They wore broad helmets with purple crests, and rough-haired black cloaks, in which they slept on the bare ground. Like the Cantabri, they washed themselves with urine instead of water. They were said to offer sacrifice to a nameless god (Strabo iii. 3. 12). In the full moon when all the household danced together before the doors of the houses. Although cruel to their enemies, they were hospitable to strangers. They ate meat with their hands, and drank a kind of mead. E. Hübner's article in Pauly-Wissowa's Real-Encyclopädie der classischen Altertumswissenschaft (viii. 718), is one of the best surveys of the ancient references, which are almost all brief. Strabo's notice (bk. iii.), based perhaps on Poseidonius, is fullest. (F. J. H.)

CEMENT (from Lat. caementum, rough pieces of stone, a shortened form of caedimentum, from caedere, to cut), apparently first used of a mixture of broken stone, tiles, etc., with some binding material, and hence of any material capable of adhering to forming into a coherent mass, fragments of a substance not in itself adhesive. The term is often applied to adhesive mixtures employed to unite objects or parts of objects (see below), but in engineering, when used without qualification, it means Portland cement, its modifications and congeners; these are all hydraulic cements, i.e. when set they resist the action of water, and can, under favourable conditions, be allowed to set under water.

Hydraulic Cements.—It was well known to builders in the earliest historic times that certain limes would, when set, resist the action of water, i.e. were hydraulic; it was also known that this property could be confounded on ordinary lime by admixture of silicious materials such as pozzolana or tufa. We have here the two classes into which hydraulic cements are divided.

When pure chalk or limestone is "burned," i.e. heated in a kiln until its carbonic acid has been driven off, it yields pure lime. This slakes violently with water, giving slaked lime, which may be made into a smooth paste with water and mixed with sand to form common mortar. The setting of the mortar is due to the drying of the lime (a purely physical phenomenon, no chemical action occurring between the lime and the sand). The function of the sand is simply that of a diluent to prevent undue shrinkage and cracking in drying. Subsequent hardening of the mortar is caused by the gradual absorption of carbonic acid from the air by the lime, a skin of carbonate of lime being formed; but the action is superficial. Mortar made from pure or "fat" lime cannot withstand the action of water, and is only used for work done above water-level. If, however, such "fat" lime is mixed in the presence of water, not with sand but with silica in an active form, i.e. amorphous and (generally) hydrate, or with a silicate containing silica in an active condition, it will unite with the silica and form a silicate of lime capable of resisting the action of water. The mixture of the lime and active silica or silicate is a pozzolanic cement. The simplest of all pozzolanic cements would be a mixture of pure lime and pure liquid silica, but though the latter is prepared artificially for various purposes, it is too expensive to be used as a cement material. A similar obstacle lies in the way of using a certain native form of active silica, viz. kieselguhr, for it is too valuable as an absorbent of nitroglycerine, for the manufacture of dynamite, to be available for making pozzolanic cement. There are, however, many silicious
substances occurring abundantly in nature which can thus be employed. This excess does no harm, for that part which fails to unite with the lime serves as a diluent, much as does sand in mortar. In fact, ordinary pozzuolanic cement made on the spot where it is to be used may be regarded as a better kind of common mortar having hydraulic qualities. Good hydraulic mortars may be made from lime mixed with furnace ashes or burnt clay as the pozzuolanic constituent.

Cements of the Portland type differ in kind from those of the pozzuolanic class; they are not mechanical mixtures of lime and active silika ready to unite under suitable conditions, but consist of definite chemical compounds of lime and silika and lime and alumina, which, when mixed with water, combine therewith, forming crystalline substances of great mechanical strength, and capable of adhering firmly to clean inert material, such as stone and sand. They are made by heating to a high temperature an intimate mixture of a calcareous substance and an argillaceous substance. The commonest of such substances in England are chalk and clay, but where local conditions demand it, limestone, marl, shale, slag, or any similar material may be used, provided that the correct proportions of lime, silika and alumina are maintained. The earliest forms of cements of the Portland class were the hydraulic limes. These were largely mori, and are prepared by burning limestone containing clayey matter. Some of these naturally possess a composition differing but little from that of the mixture of raw materials artificially prepared for the manufacture of Portland cement itself. Although hydraulic limes have been in use from the most ancient times, their true nature and the reason of their resistance to water have only become known since 1791. Next in antiquity to hydraulic lime is Roman cement, prepared by heating an indurated marl occurring naturally in nodules. Its name must not be taken to imply that it was used by the ancients; in point of fact the manufacture of this substance dates back only to 1796. With the growth of engineering in the early part of the 19th century arose a great demand for hydraulic cement. The supply of materials containing naturally suitable proportions of calcium carbonate and clay being limited, attempts were made to produce artificial mixtures which would serve a similar end. Among those who experimented in this direction was Joseph Aspdin, of Leeds, who added clay to finely ground limestone, calcined the mixture, and ground the product, which he called Portland cement. The only connexion between Portland cement and the place Portland is that the cement when set somewhat resembles Portland stone in colour. True, it is possible to manufacture Portland cement from Portland stone (after adding a suitable quantity of clay), but this is merely because Portland stone is substantially carbonate of lime; any other limestone would serve equally well. Although Portland cement is later in date than either Roman cement or hydraulic lime, yet on account of its greater industrial importance, and of the fact that, being an artificial product, it is of approximately uniform composition and properties, it may conveniently be treated of first. The greater part of the Portland cement made in England is manufactured on the Thames and Medway. The materials are chalk and Medway mud; in a few works the latter is replaced by gault.

The composition of typical samples of chalk and clay is shown in the following analyses:

These materials are mixed in the proportion of about 3:1 by weight so that the dried mixture contains approximately 75% of calcium carbonate, the balance being clay. The mixing may be effected in several ways. The method most exclusively used consists in mixing the raw materials in a vessel of large capacity of water in a wash mill, a machine having radial horizontal arms driven from a central vertical spindle and carrying hammers which stir up and intermix any soft material placed in the pit in which the apparatus revolves. The raw materials in the incorrect proportion are fed into the kiln together with a large quantity of water. The thin wetery "slip" or slurry flows into large settling tanks ("backs") where the solids in suspension are deposited; the water is drawn off, leaving behind an intimate mixture of chalk clay and water. This is dug out, and after being dried on floors heated by flues is ready for burning. This process is now almost obsolete.

According to present practice the raw materials are mixed in a wash mill with so much water that the resulting slurry contains 40 to 50% of water. The slurry, which is wet enough to flow, is ground between millstones so as to complete the process of comminution begun in the wash mill. Thrurough grinding and mixing are of the utmost importance, as otherwise the cement ultimately produced will be unsound and of inferior quality. The drying of the slurry is generally effected by the waste heat of the kilns, so that while one charge is burning another is drying ready for the next loading of the kilns. The kilns commonly employed are chamber kilns, circular structures similar to ordinary running lime kilns, having the top closed and connected at the side with a wide flue in which the slurry is exposed to the hot products of combustion from the kiln. The farther ends of the flues of several such kilns are connected with the hot kiln gas. The layer of dried slurry is loaded on to this, then a layer of coke, then a layer of slurry, and so on until the kiln is filled with coke and slurry evenly distributed. Fresh slurry is run on to the drying floors, and the kiln is started. The construction of an ordinary chamber kiln may be gathered from the accompanying diagram (fig. 1). The operation of burning is a slow one. An ordinary kiln, which will contain about 15 tons of raw materials, may require two or three days to dry and load, and four to five days to get fairly light, and will be another two or three days in burning out. Therefore, allowing adequate time for loading and unloading, each kiln will require about one week for a complete run. The output will be about 30 tons of "clinker" ready to be ground into cement. The grinding of the hard rock-like masses of cement is effected between millstones, or in modern plants in ball-mills, tube-mills and edge-runners. It is an important part of the manufacture, because the finished cement should be so fine and "floury" as possible. The large quantities of raw materials are used in many English factories. There are various modifications in practice according to local conditions; a few of these may be described. In all cases, however, the main operations are the same; viz., intimately mixing the raw materials, drying the mixture as far as necessary, and burning it at a conching temperature (about 1500°C or 2730° F.). Thus when hard limestone is the form of calcium carbonate locally available, it is ground dry and mixed with the correct proportion of clay and lime. These are ground to a very fine powder, usually with such grinding power as millstone, or in a modern plant in ball-mills. This dry mixture is loaded into the kiln and burned to a high temperature, i.e., technically "burned" although it is not a fuel; in accurate terms it is the heat which is burned, and it is the heat which generates which raises the clinker to a high temperature, i.e., technically "burned" cement. By this device a great part of the heat is regenerated and a saving of fuel is effected.

The methods of burning cement described above are obsolete. They are being replaced by the rotary process, so called because instead of the cement clinker being "burned" in fixed kilns, the cement clinker is produced in rotary kilns. These kilns vary from 60 to 150 ft. in length, an ordinary length in modern practice being 100 to 120 ft.; their diameter correspondingly varies from 6 ft. to 7 ft. The raw material is fed into the kiln, and the bricks, are carried on rollers at a slight angle with the horizontal, and are rotated by power. At the upper end the raw material is fed in as either a dry powder or as a slurry; at the lower end is a powerful current of hot air which dries the raw material and then brings it to the kiln bottom, where it is finally burnt and calcined. The material is then in a partially burnt and slightly sintered state, but it is not fully calcined and would not make Portland cement. The material continues to be ground in the ball-mills and then is ground to the required size.
CEMENT

the burner where the temperature is highest, and there heated so highly that the union of the lime, silica and alumina is complete, and fully burnt clinker falls out of the kiln. It is extremely hot, and is cooled usually by being passed down one or more rotating cylinders, similar to the first, but smaller, and acting as coolers instead of kilns. On its way down the cylinders the clinker meets a current of cold air and is cooled, the air being correspondingly warmed and passing on to aid in the combustion of the fuel used in heating up the kiln. This regenerative heating is similar in principle and effect to that obtained by means of the shaft and ring kilns described above. The output of these kilns varies from 200 to 400 tons per kiln per week according to their size and the nature of the raw materials burned, as against 30 tons per week for an ordinary chamber kiln. A large saving in labour is also secured. The rotary system presents many advantages and is rapidly replacing the older methods of cement making. Fig. 3 represents diagrammatically a rotary cement plant on the Hurry & Seaman system, which was one of the first to make cement by the rotary process successfully on a large scale, using powdered coal as fuel. Rotary kilns of various cylinders are used, but the standard combination is embodied, namely, the employment of a rotating inclined cylinder for burning the raw materials, a burner fed with powdered coal and a blast of air, and some device such as a cooling cylinder or cooling tower where the clinker is not to be cooled and the air correspondingly heated on its way to the burner.

Another method of making Portland cement which has been proposed and tried with some success consists in fusing the raw materials together in an apparatus of the type of a blast furnace. The high temperature necessary to fuse cement clinker makes this process difficult to accomplish commercially, but it has many inherent merits and may be the process of the future, displacing the rotary method.

Portland cement clinker, however produced, is a hard, rock-like substance of semi-vitrified appearance and very dark colour. The product from a well-run rotary kiln is all evenly burnt and properly vitrified; that from an ordinary fixed kiln of whatever type is apt to contain a certain amount (5 to 15%) of underburnt material, which is yellowish and friable and is not properly vitrified. This material must be picked out, as such underburnt stuff contains free lime or unsaturated lime compounds. These may be readily in the finished cement and cause such expansion as may destroy the work of which it forms part. Well-burnt, well-picked clinker when ground yields good Portland cement. Nothing is added during or after grinding save a small amount (1 to 2%) of calcium sulphate in the form of gypsum or of plaster of Paris, which is sometimes needed to make the cement slower-setting. For the same purpose a small quantity of water (up to 2%) may be added either by moistening the clinker by blow steam into the mills in which the clinker is ground. This small addition for this specified purpose is recognized as legitimate, but the employment of various cheap materials such as soapstone and blast-furnace slag, sometimes added as fillers or make-weights, is adulteration and therefore fraudulent.

The composition of Portland cement varies within comparatively narrow limits, and for given raw materials the variations are tending to become smaller as regularity and skill in manufacture increase. The following table gives the percentage of types of cement made from chalk and clay on the Thames and Medway:

There may be variations from this composition according to the nature of the raw materials employed. Thus the silica may range from 19 to 27%, the alumina and ferric oxide jointly from 7 to 13%, the lime from 60 to 67%. All such variations are permissible provided that the quantity of silica and alumina is sufficient to saturate the whole of the iron and cement with a "free" condition, likely to cause the cement to expand after setting. Other things being equal, the higher the percentage of lime within the limits indicated above the stronger is the cement, but such highly limed cement is difficult to make and may contain more than the specified 15% of lime; and unless the burning is thorough and the raw materials are intimately mixed, the cement is apt to be unsound. Although the ultimate composition of cement, that is, the percentage of each base and acid present, can be given by the following approximate composition, i.e., the nature and amount of the compounds formed from these acids and bases, can only be ascertained indirectly and with difficulty.

The foundations of our knowledge on this subject were laid by H. le Chatelier, whose work has since been supplemented by that of Spenser Newberry, W. B. Newberry and Clifton Richardson. As the outcome of these inquiries it has been established that the three essential compounds which are usual in Portland cement of good quality are of minor importance and may be regarded as little more than impurities. The silicates and aluminates of which Portland cement is composed are believed to exist not as individual units but as solid solutions of each other.

FIG. 3. (Tricalcium silicate. Hydrated tricalcium silicate. Calcium hydroxide.)

Since alite is a solid solution and, although an individual mineral, is not a chemical unit, the proportion of tricalcium silicate to tricalcium aluminate in a given specimen of alite will vary; but, whatever the proportions of the two substances, the reaction is taking place in its characteristic manner according to the equations given above.

The precise mechanism of the process of setting of Portland cement is not known with certainty, but it is probably analogous to the setting of lime. The two reactions which take place in the finished cement and cause the hydration of the compounds produced by hydration while they are in a more soluble form, their transition to a less soluble form, the consequent supersaturation of the solution, and the deposition of the insoluble substances in the crystals which interlock and form a coherent mass. This theory being accepted, it is evident that a small quantity of water, by successive dissolution and deposition of a substance capable of existing in a more soluble and in a less soluble form, is able to bring about the crystallization of an infinitely large quantity of material. It is not necessary that there should be present sufficient water to dissolve the whole of the reacting substance at any one time; it is sufficient if there is enough for hydration and a small cement, for the component by alite react, and for simplicity their reactions may be stated in separate equations, thus:

1. (3CaO·SiO₂) + 3H₂O = 3Ca(OH)₃ + SiO₂
2. 3CaO·Al₂O₃ + 9H₂O = 3Ca(OH)₂ + 2Al(OH)₃
3. 3CaO·Al₂O₃·12H₂O = 3CaO·Al₂O₃·12H₂O

Tricalcium silicate. Hydrated tricalcium silicate. Calcium hydroxide.

Tricalcium aluminate. Hydrated tricalcium aluminate.

As mentioned above, the constituents other than the tricalcium silicate and tricalcium aluminate of which alite is composed, are of minor importance. The function of the ferric oxide present in ordinary cement is little more than that of a flux in the production of silica, alumina and lime in the clinker; its rôle in the setting of the cement is altogether secondary. In fact, excellent Portland cement can be prepared from materials free from iron. Such cement, if free also from magnesia, and alkalis and silica, is often employed for exterior decorative use. Magnesia, if present in Portland cement in quantity not exceeding 5% appears to be inert, but there is evidence that in larger proportion, e.g. 10-15%, it may hydrate and set after the general setting of the cement, and may give rise to disruptive strains causing the cement to "blow" and fail. In so-called natural cement which is comparatively lightly burnt, the magnesia appears to be inert, and as much as 20 to 30% may be present. Another constituent of Portland cement which influences
its setting time is calcium sulphate, naturally formed from the sulphur in the raw materials or fuel, or intentionally added to the finished cement as gypsum or plaster of Paris. It has a remarkable retarding effect on the hydration of the calcium aluminates, and consequently on the setting of the cement. Such a cement is said to have a "heat of hydration" high enough to convert a naturally quick-setting cement into one which sets slowly. It will be observed that in the hydration of tricalcium silicate, the main constituent of Portland cement, a large portion of the lime appears as calcium hydroxide, or "slaked lime," at any time. It will be seen that this will form a pozzolanic cement if a suitable silicious material such as trass is added to the cement.

The ultimate product when set may be regarded as a mixed Portland and pozzolanic cement. The use of trass in this manner as an admixture for Portland cement has been advocated by W. L. Châtelier, and undoubtedly increases the strength of the material, but it has not become general.

The quality of Portland cement is ascertained by its analysis and by determining its specific gravity, fineness, mechanical strength and soundness. A good sample will usually have a composition within the limits cited above and approximating to the typical figures given above. It will be ground so finely that not more than 3% will pass a sieve of 75-76 mm mesh. 40% will pass a sieve of 0-005 in. in diameter. It will have, when freshly burned, a specific gravity not lower than 3-15, and briquettes made from it and kept in water will possess a tensile strength of 400-500 lb per sq. in., in seven days after they are made, while briquettes made from a mixture of 3 parts by weight of sand and 1 of cement will give about 225 lb per sq. in. at twenty-eight days. Formerly the soundness of cement was determined by keeping thin plates of the cement in cold water for twenty-eight days, or in warm water for fourteen hours, and examining for cracks or other signs of expansion. Modern practice is to measure the expansion of a test-piece of cement kept in water at a temperature of 212° F. The simplest and most generally used method is due to H. L. Clément, and consists in measuring the increase in circumference of a cylinder of cement 30 mm in diameter by means of a split ring encircling the cylinder, the motion of which is magnified by two light rods extending radially. Another quantitative soundness test has been advocated by W. A. Simpson, who has shown that briquettes of 3 of sand and 1 of cement kept in water for two days at 80° C., 176° F. attain approximately the same strength as similar briquettes attain at seven days in water at the ordinary temperature. In like manner briquettes kept at 176° F. for seven days are approximately equal in strength to those kept at the ordinary temperature for twenty-eight days. A cement not perfectly sound will give low results in the hot test, and a cement of indifferent soundness will cease to expand after it has been subjected to a moderately high temperature, and can be passed without difficulty by cement made with proper care and skill. There are many modifications and elaborations of all the tests which have been mentioned. Cement for all important work is subjected to a rigorous system of testing and approval, and it is accepted as a standard product only after the most careful examination and test by the most expert and painstaking of engineers.

**Hydraulic Lime** is a cement of the Portland class as distinct from the pozzolanic class. The most typical hydraulic lime is that known as Chaux du Thell, made from a limestone found at Ardèche in France. This limestone consists of calcium carbonate most intimately intermixed with very finely divided silica. It contains but little alumina and oxide of iron, which are the constituents generally necessary to bring about the union of silica and lime to form a cement, but in spite of this the silica is so finely divided and so well distributed that it unites readily with the lime when the limestone is burned at a sufficiently high temperature. English hydraulic limes are of a different class; they contain a good deal of alumina and ferric oxide, and in composition resemble somewhat the Portland cement.

Analyses of the two classes of hydraulic lime are as follows:

Hydraulic lime contains a good deal of uncombined lime, and has to be slaked before it is used as a cement. In France this slaking is conducted systematically by the makers, the freshly burned lime being sprinkled with water and stored in large bins where it proceeds slowly and regularly until the whole of the surplus uncombined lime is slaked and rendered harmless, while the cementitious compounds, notably tricalcium silicate, remain untouched. In English practice hydraulic lime is slaked by the user. Seeing that regular and perfect slaking is more easily attained when working systematically on a large scale and by storing the material for a long period, the French method is the better and more rational. The product may then be regarded as a cement of the Portland class mixed with slaked lime. When gauged with water and made into a mortar it sets slowly, but ultimately becomes almost lost as Portland cement. Its slow setting is an advantage for some purposes, e.g., for foundations and abutments where settlements may occur.

The structure is free to take its permanent position before the lime sets, and cracks are thus avoided. A case in point is the employment of a hydraulic lime in place of Portland cement as grouting outside the cast-iron tubes used for lining tunnels made by the shield system.

**Roman Cement** is another cement of the Portland class which came into use shortly before the manufacture of artificial Portland cement was attempted. It is still in use, though only for special purposes where a quick-setting material is required. It is made from septaria nodules which are dredged up on the Kent and Essex coasts and consist of about 60% of calcium carbonate mixed with clay, the mass being sufficiently indurated to remain coherent under water. The nodules are not prepared in any way, but simply burned at a moderate red heat.

The resulting cement varies somewhat in composition, but approximates to the following figures:

These irremedial cements are suitable materials for ordinary purposes, but are not so suitable as good artificial Portland cement for heavy and important undertakings.

**Passov Cement** is a recent product which is in a class by itself. It is made by granulating blast furnace slag of suitable composition and finely grinding the product, either alone or with an admixture of about 10% of Portland cement clinker. It differs from ordinary slag cement (see above) in that it is a pozzolanic cement depending on the interaction of granulated slag and lime. The particular method of granulating slag for Passov cement is one which produces a material which sets per se and attains a strength comparable with that of Portland cement. Passov cement has been successfully made from slag of different compositions in Germany, England and America.
The chief use of hydraulic cements, whether of the pozzolanic
or Portland class, is to act as an adhesive material in work which
is to be exposed to water. No doubt in times of remote
antiquity it was found that the jointing of masonry
which was to be immersed required the use of a cement
indifferent to the action of water. Ordinary mortar
failed in such positions; mortar made from lime prepared from
limestones or chalks containing a small clay was found to stand;
mortar made from lime mixed with trass or similar active
silicious material was also found to stand. On the observation
rests the whole of the present enormous employment of hydraulic
cements. It was a natural transition to utilize these cements
not merely for jointing masonry but also for making concrete,
and the only reason why hydraulic cements, as distinct from
cements which are not hydraulic (e.g. ordinary mortar), are used
for the latter purpose is their great mechanical strength. Their
use in above-water work is checked by the low price of common
brick. Even in such work, where it would be thought that
masses of burnt clay would be the cheapest conceivable material,
cement is at least on level terms with its rival. It must be
remembered that one of the great advantages of concrete is that
five-sixths of its total mass may be provided from local sand and
gravel, on which no carriage has to be paid. The cement, on
which alone freight is to be reckoned, converts these from loose
incoherent material into a solid stone. Thus it comes about that
the largest use of cement is for manufacturing concrete for dock
and harbour work, and for the making of foundations. It is
also employed for the building of light bridges, foreshore, and
ties constructed of cement mortar disposed round a skeleton of
iron rods. Such composite structures take advantage of both the
high tensile strength of iron and of the high compressive strength
of cement mortar. (See also CONCRETE.)

Good hydraulic cements are highly permanent materials
provided certain conditions be observed. It might be supposed
that hydraulic cements from their nature would be indifferent
for this action. As a matter of fact the structures of which
they form part are sufficiently compact. In this case the
action of the water is checked by the film of carbonate of lime
which eventually forms on the surface of calcareous cement.
This, together with the compactness of the mortar, hinders
the ingress and egress of water, and prevents the dissolution
and ultimate destruction of the cement. But where the concrete
or mortar is not well made and is porous, the continual passage
of water through it will gradually break up and dissolve away
the calcareous constituents of the cement until its strength is utterly
destroyed. This destructive action is increased if the water
contains sulphates or magnesium salts, both of which act
chemically on the calcareous constituents of the cement.
As sea-water contains both sulphates and magnesium salts, it is
especially necessary in concrete for harbour work to take every
care to produce an impervious structure. There are various
minor external causes for the failure and ultimate destruction of
cement and mortar, but these structures are not the ones to
consider for the specialist. Failure from inherent vice in the cement
has been already touched on; it can always be traced to want of
skill and care in manufacture.

Calcium Sulphate Cements.—Under this term are comprehended
all cements whose setting properties primarily depend on the
hydration of calcium sulphate. They include plaster of Paris,
Keene's cement and many variants of these two types. The
raw material is gypsum (q.v.). This may be almost chemically
pure, when it is generally used for Keene's cement; or it may
contain smaller or greater quantities of impurities, in which
case it is suitable for the preparation of cements of the plaster
of Paris class. The mode of preparation is to calculate the gypsum
at temperatures which depend on the class of cement to be
produced. If plaster of Paris is to be made, calcination is
carried out at about 204° C. (400° F.); at this temperature,
gypsum, CaSO\(_4\)-2H\(_2\)O, loses three-quarters of its combined
water and becomes 2CaSO\(_4\)-H\(_2\)O. If a cement of the Keene's
cement class is to be prepared the temperature used is higher,
e.g. 500° C. (932° F.), and the whole of the combined water of
the gypsum is expelled, the anhydrous sulphate CaSO\(_4\) being
obtained.

To produce plaster of Paris European practice consists in baking
the mineral in ovens, and in America in heating it in kettles. Both
processes are inferior in economy to calcination in rotatory
kilns, a process which may be regarded as the method of
manufacture of Portland cement, and the cement and its
congers are made in fixed kilns so constructed that only the
gaseous products of combustion come into contact with the gypsum to be burnt, in order to avoid contamination
with ashes or dust of the fire.

The setting of plaster of Paris depends on the fact that when
2CaSO\(_4\)-H\(_2\)O is treated with water it dissolves, forming a super-
saturated solution of CaSO\(_4\)-2H\(_2\)O. The excess held temporarily
in solution is then deposited in small crystals of gyspum.
Light thus subjects the mixture to repeated processes: the
mechanism of setting of plaster of Paris becomes clear. The plaster is mixed with a quantity of water sufficient to
make it into a smooth paste; this quantity of water is quite in-
sufficient to dissolve the whole of it, but allows a small part,
and gives a supersaturation of CaSO\(_4\)-2H\(_2\)O. In a few minutes
the surplus hydrated calcium sulphate is deposited from the solution,
and the water is capable again of dissolving 2CaSO\(_4\)-H\(_2\)O, which
in turn is fully hydrated and deposited as CaSO\(_4\)-2H\(_2\)O. The process
goes on until a relatively small quantity of water has by insul-
iments dissolved and hydrated the 2CaSO\(_4\)-H\(_2\)O, and has deposited
CaSO\(_4\)-2H\(_2\)O in felted crystals forming a solid mass well cemented.
The setting is rapid, occupying only a few minutes, and
is accompanied by a slight evolution of heat. There is
reason to suppose that the change described takes place in two stages,
the gypsum first forming orthorhombic crystals and then crystal-
izing in the monosymmetric system. Gypsum thus crystallized
has its setting temperature many degrees lower than that of the
conditions than the orthorhombic form. Correlatively in its process
of dehydration to form plaster of Paris, monosymmetric gypsum
is converted into the orthorhombic form before it begins to be
decayed.

The principles which govern the preparation and setting of
the other class of calcium sulphate cements, that is, cements of the
Keene class, are not fully understood, but there is a fair amount of know-
ledge of the subject on the experimental mechanical and chemical
difference between the setting of Keene's cement and that of plaster
of Paris is that the former takes place much more slowly, occupying
hours instead of minutes, and the considerable heating and expansion
which characterize the setting of plaster of Paris are much less
marked.

It is the practice in Great Britain to burn pure gypsum at a low
temperature so as to convert it into the hydrate 2CaSO\(_4\)-H\(_2\)O, to soak
this gypsum in a solution of alum or of aluminium sulphate, and to
recalci 2CaSO\(_4\)-H\(_2\)O at about 500° C. On grinding they give Keene's
cement. Instead of alum various other salts, e.g. borax, may be
used. The quantity of these materials is so small that analyses of
Keene's cement show no evidence of the presence of either calcium
aluminate or of calcium aluminate of the calcium sulphate,
and makes it difficult to explain what, if any, influence
these minute amounts of alum and the like can exert on the setting
of the cement. It seems probable that the effect of the salts is to
be understood, and that the nature of the hydrate of calcium
sulphate at which the cement has been burnt. The setting of Keene's
cement takes place by the same sort of process which has been described
for the setting of plaster of Paris, the chief differences being that the
hydrate is not dissolved, and the dehydrated calcium sulphate and that
the operation takes a longer time.

All cements having calcium sulphate as their base are suitable
only for indoor work because of the solubility of this substance.
They form excellent decorative plasters on account of their clean,
white surfaces and the sharpness of castings made from them, this latter
quantity being due to their expansion when setting.

dynamique des cements hydrauliques; Desch, Concrete, No. 2, pp. 101-102; Davis, Journ.

Adhesive Cements.—Mixtures of animal, vegetable and mineral
substances have been employed as adhesives in making joints,
mending broken china and other objects, &c. A strong
material for adhesion is a lime, prepared in such a way as to
be placed in a thin paste with a little of the ordinary
water; the object to be cemented need not be heated. For stone,
marble, and earthenware a strong cement, insoluble in water, can
be made as follows.—Skimmed-milk cheese is boiled in water till of a gluey
consistency, washed, knayed well in cold water, and incorporated

PLASTER OF PARIS. KEENE'S CEMENT.
with quicklime; the composition is warmed for use. A similar cement is a mixture of dried fresh curd with 1/4 of its weight of quicklime and a little camphor; it is made into a paste with water when employed. A cement for Derbyshire spar and china, &c., is composed of 7 parts of rosin and 1 of 15 grt. of quicklime, which, when applied to the surfaces to be united, for, as a general rule, the thinner the stratum of a cement, the more powerful its action. Quicklime mixed with white of egg, hardened Canada balsam, and thick copal or mastic with spirits of turpentine is commonly used; the chinaberry, which is already dissolved before their application. For small articles, shellac dissolved in spirits of wine is a very convenient cement. Cements such as marine glue are solutions of shellac, india-rubber or asphaltum in benzene or naphtha. For keeping pipes from rusting, 1 part of raw linseed oil is mixed with 4 parts of melted linseed oil boiled with litharge, and 8 parts of melted glue; other strong cements for the same purpose are prepared by softening gelatine in water, 1 part of gum arabic to 4 of glue, and 4 parts of some best impregnated oil of pine, with one-fourth of its weight of turgentine, or with a little bichromate of potash. Mahogany cement, for filling up cracks in wood, consists of 4 parts of beeswax, 1 of Indian red and yellow ochre to give colour. Coder's cement, used for fixing knife-blades to their hafts, is made of equal parts of brick-dust and melted rosin, or of 4 parts of rosin with 1 each of beeswax and brick-dust. For covering bottle-corks a mixture of pitch, brick-dust and rosin is employed. This cement, when only slightly exposed to moisture, is used for fixing iron rails in stone-work, is melted brimstone, or brimstone and brick-dust. For pipe-joints, a mixture of iron turnings, sulphur and sal-ammoniac, moistened with water, is employed. Japanese cement, for uniting surfaces that have been previously moistened with water, consists of 2 parts of flour and 1 of rosin. Jewellers’ or Arumese cement consists of isinglass with mastic and gum ammoniac dissolved in spirit. Gold and silver chasers keep their work firm by means of a cement of pitch and rosin, a little talcum, and some flour. The cement used for large works, such as the polishing and grinding of jewelry and optical glasses, is compounded thus:—rosin, 4 oz.; whitening previously made red-h, 4 oz.; wax, 1 oz.

CEMETERY [Gr. κοιμητήριον, from κοιμάω, to sleep], literally a sleeping-place, the name applied by the early Christians to the places set apart for the burial of the dead. These were generally extra-mural and not directly connected with churches, the practice of interment in churches or churchyards being unknown in the first centuries of the Christian era. The term cemetery has, therefore, been appropriated to any similar structure. The modern term cemeteries, for large and extra-mural, are a substitution for the overcrowded churchyards (q.v.) of populous parishes both urban and rural.

From 1840 to 1855, attention was repeatedly called to the condition of the London churchyards in correspondence in the press and by the reports of parliamentary committees, the first of which, that of Mr Chadwick, appeared in 1843. The vaults under the pavement of the churches, and the small spaces of open ground surrounding them, were crammed with coffins. In many of the buildings the air was so tainted with the products of corruption as to be a direct and palpable source of disease and death to those who frequented them. In the churchyards coffins were placed tier above tier in the graves until they were within a few feet (or sometimes even a few inches) of the surface, and the level of the ground was often raised to that of the low-lying structures.

To make room for fresh interments the sextons had recourse to the surreptitious removal of bones and partially-decayed remains, and in some cases the contents of the graves were systematically transferred to pits adjacent to the site, the grave-diggers appropriating the coffin-plates, handles and nails to be sold as waste metal. The neighbourhood of the churchyards was always unhealthy, the air being vitiated by the gaseous emanations from the graves, and the water, wherever it was obtained from wells, containing organic matter, the source of which could not be mistaken. In all the large towns the evil prevailed in a greater or less degree, but in London, on account of the immense population and the consequent mortality, it forced itself more readily upon public attention, and after more than one partial measure of relief had been passed the churchyards were, with a few exceptions, finally closed by the act of 1853, and the cemeteries which now occupy a large extent of ground in the north, south, east and west became henceforth the burial-places of the metropolis. Several of them had been already established by private enterprise before the passing of the Burial Act of 1855 (Kensal Green cemetery dates from 1832), but that enactment forms the epoch from which the general development of cemeteries in Great Britain and Ireland began. Burial within the limits of cities and towns is now almost everywhere abolished, and where it is still in use it is surrounded by such safeguards as make it practically innocuous. This tendency has been conspicuous both in the United Kingdom and the United States. The increasing practice of cremation (q.v.) has assisted in the movement for disposing of the dead in more sanitary conditions; and the proposals of Sir Seymour Haden and others for burying the dead in more open coffins, and abandoning the old system of family graves, have had considerable effect. The tendency has therefore been, while improving the sanitary aspects of the disposal of the dead, to make the cemeteries themselves as fit for possible for this purpose, and beautiful in arrangement and decoration.

The chief cemeteries of London are Kensal Green cemetery on the Harrow Road; Highgate cemetery on the slope of Highgate Hill; the cemetery at Abney Park (once the residence of Dr Watts); the Norwood and Nunhead cemeteries to the south of London; the West London cemetery at Brompton; the cemeteries at Ilford and Leytonstone in Essex; the Victoria cemetery and the Tower Hamlets cemetery in East London; and at a greater distance, accessible by railway, the great cemetery at Brookwood near Woking in Surrey, and the cemetery at New Southgate. The general plan of all these cemeteries is the same, a park with broad paths either laid out in curved lines as at Kensal Green and Highgate, or crossing each other at right angles as in the case of the West London cemetery. The ground on each side of these paths is marked off into grave spaces, and trees and shrubs are planted in the intervals between them. The buildings consist of a curator’s residence and one or more chapels, and usually there is also a range of family graves with imposing tombs, massive structures containing in their corridors recesses for the reception of coffins, generally closed only by an iron grating. The provincial cemeteries in the main features of their arrangements resemble those of the metropolis.

One of the most remarkable is St James’s cemetery at Liverpool, which occupies a deserted quarry. The face of the eastern side of the quarry is traversed by ascending gradients off which open catacombs formed in the living rock,—a soft sandstone; the ground below is planted with trees, amongst which stand hundreds of gravestones. The main approach on the north side is through a tunnel, above which, on a projecting rock, stands the cemetery chapel, built in the form of a small Doric temple with tetrastyle porticoes.

Many of the cities of America possess very fine cemeteries. One of the largest, and also the oldest, is that of Mount Auburn near Boston. Others of importance are the Laurel Hill cemetery (1836) at Philadelphia; the Greenwood cemetery (1838) at Brooklyn (New York); the Lake View cemetery at Cleveland, Ohio; while the cemeteries at New Orleans (q.v.) are famous for their beauty.

The chief cemetery of Paris is that of Père la Chaise, the prototype of the garden cemeteries of western Europe. It takes its name from the celebrated confessor of Louis XIV., to whom as rector of the Jesuits of Paris it once belonged. It was laid out as a cemetery in 1804. It has an area of about 200 acres, and contains about 20,000 monuments, including those of all the great men of France of the 19th century—marshals, generals, ministers, poets, painters, men of science and letters, actors and musicians. Twice the cemetery and the adjacent heights have been the scene of a desperate struggle; in 1814 they were stormed by a Russian column during the attack on Paris by the allies, and in 1871 the Communists made their last stand among the tombs of Père la Chaise; 900 of them fell in the defence of the cemetery or were shot there after its capture, and 200 of them were buried in quicklime in one huge grave and 700 in another. There are other cemeteries at Mont Parnasse and Montmartre, besides the minor burying-grounds at Auteuil, Batignolles, Passy, and La Villette, &c. In consequence of all these cemeteries being more or less crowded, a great cemetery was laid out in 1874 on the plateau of Méry sur Oise, 16 m. to the north of Paris, with which
it is connected by a railway line. It includes within its circuit fully 2 sq. m. of ground. The French cemetery system differs in many respects from the English. Every city and town is required by law to provide a burial-ground beyond its barriers, properly laid out and planted, and situated if possible on a rising ground. Each interment must take place in a separate grave. This, however, does not apply to Paris, where the dead are buried, forty or fifty at a time, in the fosses communes, the poor being interred gratuitously, and a charge of 20 francs being made in all other cases. The fosses is filled and left undisturbed for five years, then all crosses and other memorials are removed, the level of the ground is raised 4 or 5 ft. by fresh earth, and interments begin again. For a fee of 50 francs a concession temporaire for ten years can be obtained, but where it is desired to erect a permanent monument the ground must be bought by the executors of the deceased. In Paris the undertakers' trade is the monopoly of a company, the Société des pompes funèbres, which in return for its privileges is required to give a free burial to the poor.

The Leichenhäuser, or dead-houses, of Frankfort and Munich form a remarkable feature of the cemeteries of these cities. The object of their founders was twofold—(x) to obviate even the remotest danger of premature interment, and (2) to offer a respectable place for the reception of the dead, in order to remove the corpse from the confined dwellings of the survivors. At Frankfort the dead-house occupies one of the wings of the propylæum, which forms the main entrance to the cemetery. It consists of the warder's room, where an attendant is always on duty, on each side of which there are five rooms, well ventilated, kept at an even temperature, and each provided with a bier on which a corpse can be laid. One of the fingers is placed a ring connected by a light cord with a bell which hangs outside in the warder's room. The use of the dead-house is voluntary. The bodies deposited there are inspected at regular intervals by a medical officer, and the warder watches for the ring on the hanging bell. One revival, that of a child, has been known to take place at Frankfort. The Leichenhaus of Munich is situated in the southern cemetery outside the Sendling Gate. At one end of the cemetery there is a semicircular building with an open colonnade in front and a projection behind, which contains three large rooms for the reception of the dead. At both Frankfort and Munich great care is taken that the attendants receive the dead confined to them with respect, and no interment is permitted until the first signs of decomposition appear; the relatives then assemble in one of the halls adjoining the Leichenhaus, and the funeral takes place. In any case there is, with ordinary care, little fear of premature interment, but in another way such places of deposit for the dead are of great use in large towns, as they prevent the evil effects which result from the prolonged retention of the dead among the living. Mortuaries for this purpose have also been established in many places in England.

In Italy the Campo Santo (Holy Field) is best illustrated by the famous one at Pisa, from which the name has been given to other Italian burying-grounds. Of the cemeteries still in use in southern Europe the catacombs (q.v.) of Sicily are the most curious. There is one of these under the old Capuchin monastery of Ziza near Palermo, where in four large airy subterranean corridors 2000 corpses are ranged in niches in the wall, many of them shrunk up into the most grotesque attitudes, or hanging with pendent limbs and head from their places. As a preparation for the niche, the body is desiccated in a kind of oven, and then dressed as in life and raised into its place in the wall. At the end of the principal corridor at Ziza there is an altar strangely ornamented with a kind of mosaic of human skulls and bones. Cemeteries have been in use among many Eastern nations from time immemorial. In China, the high grounds near Canton and Macao are crowded with tombs, many of them being in the form of small tumuli, with a low encircling wall, forcibly recalling the ringed barrows of western Europe. But the most picturesque cemeteries in the world are those of the Turks. From them it was, perhaps, that the first idea of the modern cemetery, with its ornamental plantations, was derived. Around Constantinople the cemeteries form vast tracts of cypress woods under whose branches stand thousands of tomstones. A grave is never reopened; a new resting-place is formed for every one, and so the dead now occupy a wider territory than that which is covered by the homes of the living. The Turks believe that till the body is buried the soul is in a state of discomfort, and the funeral, therefore, takes place as soon as possible after death. No coffin is used, the body is laid in the grave, a few boards are arranged round it, and then the earth is shovelled in, care being taken to leave a small opening extending from the head of the corpse to the surface of the ground, an opening not unfrequently enlarged by dogs and other beasts which plunder the grave. A tombstone of white marble is then erected, surmounted by a carved turban in the case of a man, and ornamented by a palm branch in low relief if the grave is that of a woman. The turban by its varying form indicates not only the rank of various mistresses but also the period of his death, for the fashion of the Turkish head-dress is always changing. A cypress is usually planted beside the grave, its odour being supposed to neutralize any noxious exhalations from the ground, and thus every cemetery is a forest, where by day hundreds of turtle doves are on the wing or perching on the trees, and where bats and owls swim undisturbed at night. Especially for the Turkish women the cemeteries are a favourite resort, and some of them are always to be seen praying beside the narrow openings that lead down into a parent's, a husband's, or a brother's grave. Some of the other cemeteries of Constantinople contrast rather unfavourably with the simple dignity of those which belong to the Turks. That of the Armenians abounds with bas-reliefs which show the manner of the death of whoever is buried below, and on these singular tomstones there are frequent representations of men being decapitated or hanging on the gallows. See also the articles Burial and Burial-Acts; Cremation; Funeral Rites; Churchyard.

**CENCI, BEATRICE** (1577-1599), a Roman woman, famous for her tragic story; poetical fancy has woven a halo of romance about her, which modern historic research has to a large extent destroyed. Born at Rome, she was the daughter of Francesco Cenci (1549-1598), the bastard son of a priest, and a man of great wealth but dissolute habits and violent temper. He seems to have been guilty of various offences and to have got off with short terms of imprisonment by bribery; but the monstrous cruelty which popular tradition has attributed to him is purely legendary. His first wife, Ersilia Santa Croce, bore him twelve children, and nine years after her death he married Lucrezia Petroni, a widow with three daughters, by whom he had no offspring. He was very quarrelsome and lived on the worst possible terms with his children, who, however, were all of them more or less discrepable. He kept various mistresses and was even prosecuted for unnatural vice, but his sons were equally dissolute. His harsh treatment of his daughter Beatrice was probably due to his discovery that she had had an illegitimate child as the result of an intrigue with one of his stewards (A. Bertolotti, in his Francesco Cenci, publishes Beatrice's will in which she provides for this child), but there is no evidence that he tried to commit incest with her, as has been alleged. The eldest son Giacomo was a riotous, dishonest young scoundrel, who cheated his own father and even attempted to murder him (1595). Two other sons, Rocco and Cristoforo, both of them notorious rakes, were killed in brawls. Finally Francesco's wife Lucrezia and his children Giacomo, Bernardo and Beatrice, assisted by a certain Monsignor Guerra, plotted to murder him. Two bravos were hired (one of them named Olimpio, according to Bertolotti was probably Beatrice's lover), and Francesco was assassinated while asleep in his castle of Petrellas in the kingdom of Naples (1598). Giacomo afterwards had one of the bravos murdered, but the other was arrested by the Neapolitan authorities and confessed everything. Information having been communicated to Rome, the whole of the Cenci family were arrested early in 1599; but the story of the hardships they underwent in prison is greatly exaggerated. Guerra escaped;
Luceria, Giacomo and Bernardo confessed the crime; and Beatrice, who at first denied everything, even under torture, also yielded by confessing. Great efforts were made to obtain mercy for the accused, but the crime was considered too heinous, and the pope (Clement VIII) refused to grant a pardon; on the 11th of September 1599, Beatrice and Luceria were beheaded, and Giacomo, after having been tortured with red-hot pincers, was killed with a mace, drawn and quartered. Bernardo's penalty, on account of his youth, was commuted to perpetual imprisonment, and after a year's confinement he was pardoned. The property of the family was confiscated.

The romantic character of the history of this family has been the subject of poems, dramas and novels. Shelley's tragedy is well known as a magnificent piece of writing, although the author adopts a purely historical view of the events. No. F. D. Guerraz's novel, Beatrice Cenci (Milan, 1872), more trustworthy. The first attempt to deal with the subject on documentary evidence is A. Bertolotti's Francesco Cenci e la sua famiglia (2nd ed., Florence, 1879), containing a number of interesting documents which throw light on the events in their true light; cf. Labruzzi's article in the Nuova Antologia, 1879, vol. xiv., and another in the Edinburgh Review, January 1879.

CENOBITES (from Gr. κοινός, common, and φίλος, life), monks who lived together in a convent or community under a rule and a superior,—in contrast to hermits or anchorites who live in isolation. The Basilians (g.v.) in the East and the Benedictines (g.v.) in the West are the chief cenobitical orders (see MONASTICISM).

CENOMANI, a branch of the Aulerci in Gallia Celtica, whose territory corresponded generally to Maine in the modern department of Sarthe. Their chief town was Vindinum or Suindunum (corrupted into Subdinium), afterwards Civitas Cenomanorum (whence Le Mans), the original name of the town as usual in the case of Gallic cities, being replaced by that of the people. According to Caesar (Bell. Gall. vii. 75 3), they assisted Vercingetorix in the great rising (52 B.C.) with a force of 5000 men. Under Augustus they formed a civitas stipendiaria of Gallia Lugdunensis, and in the 4th century part of Gallia Lugdunensis. About 400 B.C., under the leadership of Etilius (Livy v. 35), a large number of the Cenomani crossed into Italy, drove the Etruscans southwards, and occupied their territory. The statement of Cato (in Pliny, Nat. Hist. iii. 130), that some of them settled near Massilia in the territory of the Volcae, may indicate the route taken by them. The limits of their territory are not clearly defined, but were probably the Athesis (Adige or Etsch) on the east, the Ollius (Oglio, or perhaps the Addua) on the west, and the Padus on the south. Livy gives their chief towns as Brixia (Brescia) and Verona; Pliny, Brixia and Cremona. The Cenomani nearly always appear in history as loyal friends and allies of the Romans. When they assisted in the Gallic war (225 B.C.), when the Boi and Insutres took up arms against Rome, and during the war against Hannibal. They certainly joined in the revolt of the Gauls under Hamilcar (202), but after they had been defeated by the consuls Gaius Cornelius (197) they finally submitted. In 40, with the rest of Gallia Transpadana, they acquired the rights of citizenship.

The orthography and the quantity of the penultimate vowel of Cenomani have given rise to discussion. According to Arbois de Jubainville, the Cenomani of Italy are not identical with the Cenomani (or Cenomani) of Gaul. In the case of the latter, the survival of the syllable "man" in Le Mans is due to the stress laid on the vowel; had the vowel been short and unaccented, it would have disappeared. In Italy, Cenomani is the name of a people; in Gaul, merely a surname of the Aulerci.

See A. Voisin, Les Cénonaux anciens et modernes (Le Mans, 1862); A. Desjardins, Géographie historique de la Gaule romaine, ii. (1787-1803); Arbois de Jubainville, Les Premiers Habitants de l'Europe (1889-1894); article and authorities in La Grande Encyclopédie; C. Hülsen in Pauly-Wissowa's Realencyclopädie, iii. pt. 2 (1899); full ancient authorities in A. Holder, Alt-celtischer Sprachschatz, i. (1896).

CENOTAPH (Gr. κενός, empty, τάφος, tomb), a monument or tablet to the memory of a person whose body is buried elsewhere.

The custom arose from the erection of monuments to those whose bodies could not be recovered, as in the case of drowning.

CENSOR (from Lat. censurare, assess, estimate; in Gr. τητοιοί). I. In ancient Rome, the title of the two Roman officials who presided over the census, the registration of individual citizens for the purpose of determining the duties which they owed to the community. In the etymology of the word lurks the idea of the arbitrary assignment of burdens or duties. Varro defines census as arbitrarium, and derives the name censores from the position of these magistrates as arbitrari populi (Varro, de Ling. Lat. v. 81; ap. Non. p. 519). This original idea of "discretionary power" was never entirely lost; although ultimately it came to be more intimately associated with the appreciation of morals than with the assignment of burdens. From the point of view of its moral significance the censorship was the Roman manifestation of that state control of conduct which was a not unusual feature of ancient societies. It is true that Rome possessed sumptuary laws, and laws dealing with moral offences, which it was the duty of other magistrates to enforce; but the organization for the control of conduct was mainly exhibited in the censorship, and, as thus exhibited, was at once simple and comprehensive.

The censorship was believed to have been instituted in 443 B.C. to relieve the consuls of the duties of registration. Since the periods of registration were quinquennial, it was not a continuous office; but its tenure does not seem to have been fixed until 434 B.C., when a lex Aemilia provided that the censors should hold office for eighteen months. This magistracy was at first confined to patricians; a plebeian censor is first mentioned in 351 B.C. A lex Publilia of 339 B.C. is said to have enacted that one censor must be a plebeian. Two plebeian censors were for the first time elected in 131 B.C. The election always took place in the Comitia Centuriata (see COMITIA). The censorship, although lacking the powers implied in the imperium and the right of summoning the senate and the people, was not only one of the higher magistracies, but was regarded as the crown of a political career. It was an irresponsible office; and the only limitations on its powers were created by the restriction of tenure to a year and a half, the fact that re-election was forbidden, and the restraint imposed on each censor by the fact that no act of his was valid without the assent of his colleague. The original functions of the censors were (1) the registration of citizens in the state-divisions, such as tribes and centuries; (2) the taxation of such citizens based on an estimate of their property; (3) the right of exclusion from public functions on moral grounds, known as the regimen morum; (4) the solemn act of purification (lustrum) which closed the census. Two other functions were subsequently added: (5) the selection of the senate (lectio senatus, see SENATE), and (6) certain financial duties such as the leasing of the contracts for tax-collecting and for the repair of public buildings. The first four of these functions were those of the census, which was a detailed examination of the citizen body as represented by heads of families (patres familium) in the Campus Martius. The equites were a select portion of this citizen body; but the review of these knights took place only in the Campus, but in the Forum (see EQUITI). It was in connexion with this review of the ordinary citizens and the knights, as well as with the choice of senators, that the censors published their edicts stating the moral rules which they intended to enforce. The offences which they punished were sometimes concerned with family life and private relations, sometimes with breaches of political duty. Certain professions, such as that of an author or gladiator, also invoked their stigma, and at times the disqualifications they pronounced were the consequence of a previous judicial condemnation. Infamia was the general name given to the disabilities pronounced by the censor. These varied in degree from the deprivation of a senator of his seat, or a knight's loss of his horse, to exclusion from the tribes or centuries, an exclusion which entailed the loss of voting power. All the disabilities pronounced by one pair of censors might be removed by their successors.

The censorship, although its control over the senate came to
be weakened (see Senate), lasted as long as the republic; and it was only suspended, not abolished, during the principate. Although the princes exercised censural functions, he was seldom censor. Yet the office itself was held by Claudius and Vespasian. Domitian assumed the title of life censor (censor perpetuus), but the precedent was not followed. A fruitless attempt to galvanize the republican office into new life was made in A.D. 251, during the reign of the emperor Decius.

A. H. J. G.

II. In modern times the word "censor" is used generally for one who exercises supervision over, or criticizes, the conduct of other persons. In the universities of Oxford and Cambridge it is the title of the official head or supervisor of the non-collegiate students (i.e. those who are not attached to a college, hall or hostel). In Oxford the censor is nominated by the vice-chancellor and the proctors, and holds office for five years; in Cambridge he is similarly appointed, and holds office for life. The censors of the Royal College of Physicians are the officials who grant licences.

Censorship, in American constitutional history, is the name given to a council provided by the constitution of Pennsylvania from 1776 to 1790, and by the constitution of Vermont from 1777 to 1870. Under both constitutions the council of censors was elected once in seven years, for the purpose of inquiring into the working of the governmental departments, the conduct of the state officers, and the working of the laws, and as to whether the constitution had been violated in any particular. The Vermont council of censors, limited in number to thirteen, had power, if they thought the constitution required amending in any particular, to call a convention for the purpose. A convention summoned by the council in 1870 amended the constitution by abolishing the censors.

For the censorship of the press, see Press Laws; for the censorship of plays, Theatre: Law, and Lord Chamberlain.

Censorinus, Roman grammarian and miscellaneous writer, flourished during the 3rd century A.D. He was the author of a lost work De Accentibus, and of an extant treatise De Die Natali, written in 238, and dedicated to his patron Quintus Caerellius as a birthday gift. The contents are of a varied character: the natural history of man, the influence of the stars and genii, music, religious rites, astronomy, the doctrines of the Greek philosophers. The second part deals with chronological and mathematical questions, and has been of great service in determining the principal epochs of ancient history. The whole is full of curious and interesting information. The style is clear and concise, although somewhat rhetorical, and the Latinity, for the period, good. The life of Pope Zosimus and Suetonius. Some scholars, indeed, hold that the entire work is practically an adaptation of the lost Pratum of Suetonius. The fragments of a work De Natali Institutione, dealing with astronomy, geometry, music and versification, and usually printed with the De Die Natali of Censorinus, are not by him. Part of the original MS., containing the end of the genuine work, and the title and name of the author of the fragment are lost.

The only good edition with commentary is still that of H. Lindenbrog (1614); the most recent critical editions are by O. Jahn (1845), F. Hirtich (1867), and J. Cholodniak (1890). There is an English translation of the De Die Natali (the first eleven chapters being omitted) with notes by W. Maude (New York, 1900).

Census (from Lat. censum, to estimate or assess; connected with some with centum, i.e. a count by hundreds), a term used to denote a periodical enumeration restricted, in modern times, to population, and occasionally to industries and agricultural resources, but formerly extending to property of all kinds, for the purpose of assessment.

Operations of this character have been conducted with different objects from very ancient times. The fighting strength of the city of Rome at the time of Augustus was ascertained by a census of all males of twenty years old and upwards, made by enumerators appointed for each clan. The Levites, who were exempted from military duties, were separately enumerated from the age of thirty upwards, and a similar process was ordained subsequently by Solomon, in order to distribute amongst them the functions assigned to the priestly body in connexion with the temple. The census unwillingly carried out by Joab at the behest of David related exclusively to the fighting men of the community, and the dire consequences ascribed to it were quoted in reprobation of such inquiries as late as the middle of the 18th century. It appears, too, that a register of the population of each clan was kept during the Babylonian captivity and its totals were published on their return to Jerusalem. In the Persian empire there was apparently some method in force by which the resources of each province were ascertained for the purpose of fixing the tribute. In China, moreover, an enumeration of somewhat the same nature was an ancient institution in connexion with the provincial revenues and military liabilities. In Egypt, Amasis had the occupation of each individual annually registered, nominally to aid the official supervision of morals by discouraging disreputable means of subsistence; and this ordinance, according to Herodotus, was introduced by Solon into Athens for the sake of administration, where it developed later into an electoral record.

It was in Rome, however, that the system from which the name of the inquiry is derived was first established upon a regular footing. The original census was ascribed to Servius Tullius, and in the constitution which goes by his name it was decreed that every fifth year the population should be enumerated along with the property of each family—land, live-stock, slaves and freedmen. The main object was to ensure the accurate division of the people into the six main classes and their respective centuries, which were based upon considerations of combined numbers and wealth. With the increase of the city the operation grew in importance, and was followed by an official lustrum, or purificatory sacrifice, offered on behalf of the people by the censors or functionaries in charge of the classification. Hence the name of lustrum came to denote the intercensal term, or a period of five years. The word census, too, came to mean the property qualification of the class, as well as the process of registering the resources of the individual. Later, it was used in the sense of the imposition itself, in which it has survived in the contracted form of 251, &c. Unfortunately the statistics of the period are subordinated to the fiscal interests of the inquiry, and no record has been handed down relating to the population of the city and its neighbourhood. In the time of Augustus the census was extended to the whole empire. In the words of the Gospel of St Luke, he ordered "the whole world to be taxed," or, according to the revised version, to be enrolled. The compilation of the results of this the most comprehensive enumeration till then attempted was engaging the attention of the emperor, it is said, just before his death, but was never completed. The various inquiries instituted during the middle ages, such as the Domesday Book and the Breviary of Charlemagne, were so far on the Roman model that they took little or no account of the population, the feudal system probably rendering information regarding it unnecessary for the purposes of taxation or military service.

The foundations of the census on the modern system were laid in Europe towards the middle or end of the 17th century. Sweden led the way, by making compulsory the parish record of births, deaths and marriages, kept by the clergy, and extending it to include the whole of the domiciled population of the parish. In France, Colbert, in 1670, ordered the extension to the rural communes of the system which had for many years been in force in Paris of registering and periodically publishing the domestic occurrences of the locality. Five years before this, however, a periodical enumeration by families and individuals had been established in the colony of New France, and was continued in
CENSUS

663

Quebec from 1663 till 1754. This, therefore, may be considered to be the earliest of modern censuses.

Efforts have been almost unceasingly made since 1872 by statistical experts in periodical conference to bring about a general understanding, first, as to the subjects which may be considered most likely to be ascertained with approximate accuracy at a census, and secondly—a point of scarcely less importance—as to the form in which the results of the inquiry should be compiled in order to render comparison possible between the facts recorded in the different areas. In regard to the scope of the inquiry, it is recognized that much is practicable in a country where the agency of trained officials is employed throughout the operation which cannot be expected to be adequately recorded where the responsibility for the correctness of the replies is thrown upon the householder. The standard set up by eminent statisticians, therefore, may be taken to represent an ideal, not likely to be attained anywhere under present conditions, but towards which each successive census may be expected to advance. The subjects to which most importance is attached from the international standpoint are age, sex, civil condition, birthplace, illiteracy and certain infirmities. Occupation, too, should be included, but the record of so detailed a subject is usually considered to be better obtained by a special inquiry, rather than by the rough and ready methods of a synchronous enumeration. This course has been adopted in Germany, Belgium and France, and an approach to it is made in the decennial census of Canada and the United States. Religious denomination, another of the general subjects suggested, is of considerably more importance in some countries than in others, and the same may be said of nationality; which is often usefully supplemented by the return of mother-tongue. Nor should it be forgotten that the internal classification and the combinations of the above subjects are also matters to be treated upon some uniform plan, if the full value of the statistics is to be extracted from the raw material. On the whole, the progress towards a general understanding on many, if not most, of the questions here mentioned which has been made in the present generation, is a gratifying tribute to those who have long laboured in the cause of efficient enumeration.

THE BRITISH EMPIRE

England and Wales.—Up to the beginning of the 19th century the number of the population was a matter of estimate and conjecture. In 1753 a bill was introduced by a private member of the House of Commons, backed by official support, to provide for the annual enumeration of the people and of the persons in receipt of parochial relief. It was violently opposed as "subversive of the last remains of English liberty" and as likely to result in "some public misfortune or an epidemic diseasement." After passing that House, however, the bill was thrown out by the House of Lords. The fear of disclosing to the enemies of England the weakness of the country in fighting-material was one of the main objections offered to the proposal. By the end of the century, however, owing to a great extent to the publication of the works of Malte-Brun, there was a movement to the opposite direction, it was thought desirable to possess the means of judging from time to time the relations between an increasing population and the means of subsistence. A census bill, accordingly, again brought in by a private member, became law without opposition at the end of 1800, and the first enumeration under it took place in March of the following year, the operations being confined to Great Britain. The inquiry was entrusted in England to the overseers, acting under the justices of the peace and the high constables, and in Scotland, to village schoolmasters, under the sheriffs. A supplementary statement of births, deaths and marriages for each parish was required from the clergy, who transmitted it to parliament through the bishops and priates respectively. There was no central office or control. The schedule required the number of houses, inhabited and otherwise, the population of each family, by sex, and the occupation, under one of the three heads, (a) agriculture, (b) trade, manufacture or industry, or (c) other than these two. The results, which were not satisfactory, were published without comment. Ten years later, the chief alteration in the inquiry was the substitution of the main occupation of the family for that of the individual. The report on this census contained a very valuable exposition of the difficulties involved in such operations and the numerous sources of error latent in an apparently simple set of questions. In 1821 an attempt to get a return of ages was made, but it was not repeated in 1831, when the attention of the enumerators was concentrated upon greater detail in the occupation record. Their efforts were successful in getting a better, but still far from complete result. The creation, in 1834, of poor law unions, and the establishment, in 1836, of civil registration districts, as a rule coterminous with them, provided a new basis for the taking of a census, and the operations in 1841 were made over accordingly to the supervision of the registrar-general and his staff. The inquiry was extended to the sex, age and occupation of every individual; those born in the district were distinguished from others, foreigners being also separately returned. The number of houses inhabited, uninhabited and under construction respectively, was noted in the return. The parish statement of births, deaths and marriages was sent up by the clergymen for the last time. The most important innovation, however, was the transfer of the responsibility for filling up the schedule from the overseers to the householders, thereby rendering possible a synchronous record.

With some modification in detail, the system then inaugurated has been since maintained. In 1851 the relationship to the head of the family, civil condition, and the blind and deaf-mute were included in the inquiry. On this occasion, the act providing for the census was interpreted to authorize the collection of details regarding accommodation in places of public worship and the attendance thereat, as well as corresponding information about educational establishments. A separate report was published on the former subject which proved something of a storm centre. The census of 1871 obtained for the first time a return of persons of unsound mind not confined in asylums. During the next ten years, the separate areas for which population returns had to be prepared were seriously multiplied by the creation of sanitary districts, to the number of 666. The necessity, for administrative or other purposes, of tabulating separately the returns for so many cross-divisions of the country constitutes one of the main difficulties of the English census operations, more particularly as the boundaries of these areas are frequently altered. In anticipation of the census of 1891, a treasury committee was appointed to consider the various suggestions made in regard to the form and scope of the inquiry. Its proposals were adopted as to the subdivision of the occupation columns into employer, employed and independent worker, and as to the record upon the schedule of the number of rooms occupied by the family, where not more than five. Separate entry was also made of the persons living upon property or resources, but not following any occupation. No action was taken, however, upon the more important recommendation that there should be between each enumeration a simple enumeration by sex and age should be effected. A return was also prepared for Wales, of those who could speak only Welsh, only English, and both languages, but, owing to the inclusion of infants, the results were of little value. In 1901 the same information was collected for, excluding all under three years of age. The term tenement, too, was substituted for that of storey, as the subdivision of a house, whilst in addition to inhabited and uninhabited houses, those occupied by day, but not by night, were separately recorded. The nationality of those born abroad, which used to be returned only for British subjects, was called for from all not born within the kingdom.

Scotland.—In the acts relating to the census from 1801 to 1831, provision for the enumeration of Scotland was made with that for England and Wales, allowance being made for the differences in procedure, which mainly concerned the agency to be employed. In 1855, however, civil registration of births and deaths was established in Scotland, and the conduct of the census of 1861 was, by a separate act, entrusted to the registrars-
CENSUS

664
general of that country. The same course was followed at the three succeeding enumerations, but in 1901 the former practice was resumed. The complexity of administrative areas, though far less than in England, was simplified, and the census compilation proportionately facilitated, by the passing of the Local Government Act for Scotland, in 1889. In 1881, the definition of a house in Scotland was made identical with that in England, since previously what was called a house in the northern portion of Great Britain was known as a tenement in the south, and vice versa. Since 1861 a return has been called for in Scotland of the number of rooms with one or more windows, and that of children of school-age under instruction is also included in the inquiry. The number of persons speaking Gaelic was recorded for the first time in 1881. The question was somewhat expanded at the next census, and in 1901 was brought into harmony with the similar inquiry as to Welsh and Manx.

Ireland.—An estimate of the population of Ireland was made as early as 1672, by Sir W. Petty, and another in 1712, in connexion with the hearth-money, but the first attempt to take a regular census was made in 1811, through the Grand Juries. It was not successful, and in 1821 again, the inquiry was considered to be but little more satisfactory. The census of 1831 was better, but the results were considered exaggerated, owing to the system of paying enumerators according to the number of returns they reported. This was done voluntarily, and supplemented by a revisional inquiry three years afterwards, in order to get a good basis for the newly introduced system of public instruction. The completion of the ordinance survey and the establishment of an educated constabulary force brought the operations of 1841 up to the level of those of the sister kingdom. The main difference in procedure between the two inquiries is that in Ireland the scheme is filled in by the enumerator, a member of the constabulary, or, in Dublin, of the metropolitan police, instead of being left to the householder. The tabulation of the returns, again, is carried out at the central office from the original schedule, and not, as in England, from the book into which the former has been copied by the enumerating agency. The inquiry in Ireland is more extensive than that in Great Britain. It includes, for instance, a considerable amount of information regarding holdings and stock. The details of house accommodation are fuller. A column is provided for the degree of education, and another for religious denomination, an addition which has always been successfully resisted in England. This last information was omitted in 1851, on account of the condition following enumerations without materially affecting the extent of the record. The inquiry as to infirmities, too, is made to extend to those temporarily incapacitated from work, whether at home or in a hospital. There is also a column for the entry of persons speaking the Irish language only or able to speak both that and English. In the report of 1901 for England and Wales (p. 170) a table is given showing, for the three divisions of the United Kingdom, the relative number of persons speaking the ancient languages either exclusively or in addition to English.

British Colonies and Dependencies.—A simultaneous and uniform census of the British empire is an ideal which appeals to many, but its practical advantages are by no means commensurate with the difficulties to be surmounted. Scattered as are the colonies and dependencies over the world, the date found most suitable for the inquiry in the mother country and the temperate regions of the north is the opposite in the tropics and inconvenient at the antipodes. Then, again, as to the scope of the inquiry, the administrative purposes for which information is thus collected vary greatly in the different countries, and the inquiry, too, has to be adapted to what the conditions of the locality allow, and the population dealt with is likely to be able and willing to answer. By prearrangement, no doubt, uniformity may be obtained in regard to most of the main statistical facts ascertainable at a census, at all events in the more advanced units of the empire, and proposals to this effect were made by the registrar-general of England and Wales in his report upon the figures for 1901. Previous to that date, the only step towards compilation of the census results of the empire had been a bare statement of area and population, appended without analysis, comparison or comment, to the reports for England and Wales, from the year 1861 onwards. In 1905, however, the returns published in the colonial reports were combined with those of the United Kingdom, and the subjects of house-room, sex, age, civil condition, birthplace, occupation, and, where available, instruction, religion and infirmities, were reviewed as fully as the want of uniformity in the material permitted (Command paper, 2860, 1906). The measures taken by the principal states, colonies and dependencies for the periodical enumeration of their population are set forth below.

Canada.—The first enumeration of what was afterwards called Lower Canada, took place, as above stated, in 1665, and dealt with the legal, or domiciled, population, not with that at present the subject of the census, a practice still maintained, in contrast to that prevailing in the rest of the empire. The record was by families, and included the sex, age and civil condition of each individual, with a partial return of profession or trade. Later on, the last item was abandoned in favour of a fuller return of agricultural resources, a feature which has remained a prominent part of the inquiry. After the British occupation, a census was taken in 1765 and 1784, and annually from 1824 to 1842, the information asked for differing from time to time. Enumerations were conducted independently in the different states, and the first systematic attempt to extend the census was taken of the older parts of the Dominion. Since then, the enumeration has been decennial, except in the case of the more recently colonized territories of Manitoba and the North-West, where an intermediate census was found necessary in 1885–1886. The census of Canada is organized on the plan adopted in the United States rather than in accordance with British practice, and includes much which is the subject of annual returns in the latter country, and is not officially collected at all. The details of deaths in the year preceding the census, for instance, are collected for there being no registration of such occurrences in the rural tracts. In consideration of the large immigrant population again, the birthplace of each parent is recorded, with details as to nationality, naturalization and date of immigration. Occupation is dealt with minutely, in connection with temporary unemployment, average wage or salary earned, and other particulars. No less than eleven schedules are employed, most of them relating to details of industries and production. The duty of filling up so comprehensive a return, involving an answer to 561 questions, is not left to the householder, but entrusted to enumerators specially engaged, working under the supervision of the Department of Agriculture. Overcome the the multiplicity of population and difficulties of communication in a great part of the dominion, the inquiry, though referred to a single date, is not completed on that day, a month being allowed to the enumerator for the collection of his returns and their revision and transmission to the central office. A special feature in the operations is the provision, necessitated by the record of the legal population, for the inclusion in the local return of the persons temporarily absent on the date of the census, and their adjustment in the general aggregales, a matter to which considerable attention is paid. The very large mass of detail collected at these inquiries entails an unusually long time spent in compilation; the statistics of population, accordingly, are available considerably in advance of those relating to production and industries.

Australasia.—As the sphere of the census operations in Canada has been gradually spreading from the small beginnings on the east coast to the immense territories of the north-west, so, in the island continent, colonisation, first concentrated in the south-east, has extended along the coasts and thence into the interior, except in the north-western region. The first act of effective occupation of the country having been the establishment of a penal settlement, the only population to be dealt with in the earlier years of British administration was that under restraint, with its guardians and a few scattered immigrants in the immediate neighbourhood of Sydney Cove. This was enumerated from 1788 onwards by official “musters,” at first weekly, and afterwards at lengthening intervals. The record was so inaccurate
that it had no statistical value until 1820, when the muster was taken after due preparation and with greater care, approximating to the system of a regular census. The first operation, however, called by the latter name, was the enumeration of 1828, when an act was passed providing for the enumeration of the whole population, the occupied area and the live-stock. The details of population included sex, children and adults respectively, religion and status, that is whether free (immigrants or liberated convicts), on ticket-of-leave, or under restraint. A similar inquiry was made in 1833 and again in 1836. In 1841 a separate census was taken of New Zealand and Tasmania respectively. The scope of the inquiry in New South Wales was somewhat extended and made to include occupations other than agriculture and stock-breeding. Five years later, the increase of the population justified the further addition of particulars regarding birthplace and education. The record of status, too, was made optional, and in 1856 was omitted from the schedule. In that year, moreover, Victoria, which had become a separate colony, took its own census. South Australia, too, was enumerated in 1846, ten years after its foundation as a colony. From 1861 the census has been taken decennially by all the states except Queensland, which has been New Zealand's rival. On quinquennial since 1875 and 1881 respectively. Up to and including the census of 1901 each state conducted separately its own inquiries. The scheme of enumeration is based on that of Great Britain, modified to suit the conditions of a thin and widely scattered population. The schedules are distributed by enumerators acting under district supervisors; but it is found impossible to collect the whole number in a single day, nor does the mobility of the population in the rural tracts make such expedition necessary. In more than one state the police are employed as enumerators, but elsewhere, a staff has to be specially recruited for the purpose. The operations were improved and facilitated by means of an interstatal conference held before the census of 1891, at which a standard schedule was adopted and a series of general tables agreed upon, to be supplemented in greater detail according to the requirements of each state. The standard schedule, in addition to the leading facts of sex, age, civil condition, birthplace, occupation and house-room, includes education and sickness as well as infirmities, and leaves the return of religious denomination optional, as with New Zealand in later. In quinquennial the bread-winner is distinguished from his dependants and is returned as employer, employed, or working on his own account, as is now the usual practice in census-taking. Each state issues its own report, in which the returns are worked up in the detail required for both local administrative purposes, and for comparison with the corresponding returns for the neighbouring territory. The reports for New South Wales and Victoria are especially valuable in their statistical aspect from the analysis they contain of the vital conditions of a comparatively young community under modern conditions of progress.

South Africa.—Almost from the date of their taking possession of the Cape of Good Hope and its vicinity, the Netherlands East Indian Company instituted annual returns of population, live-stock and agricultural produce. The results from 1687 for nearly a century were recorded, but do not appear to have been more accurate than those subsequently obtained on the same method by the British government, by whom they were discontinued in 1856. The information was collected by district officials, unguided by any general instructions as to form or procedure. The first synchronous census of the colony, as it was then constituted, took place in 1856, on a fairly comprehensive schedule. Ten years later the inquiry was extended to religion and civil condition, and for the census of 1891, again, a rather more elaborate schedule was used. The next census was deferred till 1904; in consequence of the disorganization produced by the Boer war. The inquiry was on the same lines as its predecessors, with a little more detail as to industries and religious denomination. Speaking generally, the administration of the operations is conducted upon the Australian plan, with special attention to allaying the distrust of the native and more ignorant classes, for which purpose the influence of the clergy was enlisted. In some tracts it was found advisable to substitute a less elaborate schedule for that generally prescribed. In Natal, indeed, where the first independent census was taken in 1891, the Kaffir population was not on that occasion enumerated at all. In 1904, however, they were counted on a very simple schedule, by sex and by large age-groups up to 40 years old, with a return of birthplace, in a form affording a fair indication of race. Natives of India, an element of considerable extent and importance in this colony, are enumerated apart from the white population, but in full detail, recognizing the remarkable difference between the European and the Oriental in the matter of age distribution and civil condition. The Transvaal and the Orange River colonies were enumerated in 1904. In the latter, a census had been taken in 1890, in considerable detail, but that of the Transvaal, in 1896, seems to have been far from complete or accurate even in regard to the white population. In Southern Rhodesia the white residents were enumerated in 1891, but it was not until 1904 that the whole population was included in the census. The difficulty in all these cases is that of procuring a sufficient quantity of efficient agency, especially where a large and illiterate native population has to be taken into account. For this reason, amongst others, no census had been taken in Northern Rhodesia, the British possessions and protectorates of eastern Africa, or, again, of Nigeria and the protectorates attached to the West African colonies of Gambia, Sierra Leone and Lagos.

The West Indies.—Each of the small administrative groups here included takes its census independently of the rest, though since 1871 all take it about the date fixed for that of the United Kingdom. The information required differs in each group, but the schedule is, as a rule, of a simple character, and the results of the inquiry are usually set forth with comparatively little comment or analysis. In some of the groups distinctions of colour are returned in general terms; in others, not at all. On the other hand, considerable detail is included regarding the indentured labourers recruited from India, and those of this class who are permanently settled on the land in Guiana and Trinidad. No census was taken in the former, or in Jamaica and Barbados, in 1901.

Ceylon.—Here the census is taken decennially, on the same model as in India, in consideration of the constant stream of migration between the two countries. The schedule is much the same as in India with the substitution of race for caste. Until 1901, however, it was not filled in by the enumerator, as in India, but was distributed before and collected after the appointed date as in Great Britain.

India.—The population of India is the largest aggregate yet brought within the scope of a synchronous and uniform enumeration. It amounts to three-fourths of that of the British Empire, and but little less than a fifth of the estimated population of the world. Between 1853 and 1881 each province conducted its own census operations independently, with little or no attempt at uniformity in date, schedule or tabulation. In the latter year the operations were placed for the first time under central administration, and the like procedure was adopted in 1891 and 1901, with such modification of detail as was suggested by the experience of the preceding census. On each occasion new areas had to be brought within the sphere of enumeration, whilst the necessity for the use in the wilder tracts of a schedule simpler in its demands than the standard, grew less as the country got more accustomed to the inquiry, and the efficiency of the administrative agency increased. Not more than 5% of the householders in India can read and write, and the proportion capable of fully understanding the schedule and of making the entries in it correctly is still lower. From the literate minority, therefore, agency has to be drawn in sufficient strength to take down every particle of the information dictated by the heads of families. As it would be impossible for an enumerator to get through this task in the course of the census night for more than a comparatively small number of houses, the operation is divided into two processes. First a preliminary record is made a short time before the night in question, of the persons ordinarily residing in each house.
Then, on that night, the enumerator, reinforced if necessary by aid drafted from outside, revisits his beat, and brings the record up to date by striking out the absent and entering the new arrivals. The average extent of each beat is arranged to include about 700 persons. Thus, in 1901, not far from a million men were required for enumeration alone. To this army must be added the controlling agency, of at least a tenth of the above number, charged with the instruction of their subordinates, the inspection and correction of the preliminary record, and the transmission of the schedule books to the local centre after the census has been taken. The supply of agency for these duties is, fortunately, not deficient. Irrespective of the large number of clerks, village scribes and state and municipal employés which can be drawn upon with but slight interruption of official routine, there is a fair supply of casual literary labour up to the moderate standard required. The services, too, of the educated public are often voluntarily placed at the disposal of the local authorities for the census night, with no desire for remuneration beyond out-of-pocket expenses, and the addition, perhaps, of a personal letter of thanks from the chief official of the district. By means of a well-organized chain of tabulating centres, the preliminary totals, by sexes, of the 294 millions enumerated in 1901 were given to the public within a fortnight of the census, and differed from the final results by no more than 94 or 95%. The schedules adopted for enumeration were drawn up for the standard subjects of sex, age, civil condition, birthplace, occupation and infirmities, columns for mother-tongue, religion and sect, and caste and sub-caste. It is printed in about 20 languages. The results for each province or large state are tabulated locally, by districts or linguistic divisions. The final compilation is done by a provincial superintendent, who prepares his own report upon the operations and results. This work has usually an interest not found in corresponding reports elsewhere, in the prominent place necessarily occupied in it by the ethnographical variety of the population.

FOREIGN COUNTRIES

Inquiries by local officials in connexion with measures of taxation, such as the hearth-tax in France, were instituted in continental Europe as early as the 14th century; but as the basis of an estimate of population they were intrinsically untrustworthy. Going outside Europe, an extreme instance of the results of combining a census with more definite administrative objects may be found in the census of China in 1721, when the population enumerated in connexion with a poll-tax and the monthly payment of hearth-money to the government was 8 millions 800,000; forty years later, when the question was that of the measures for the relief of widespread distress, the corresponding total rose to 105 millions! The notion of obtaining a periodical record of population and its movement, dissociated from fiscal or other liabilities, originated, as stated above, in Sweden, where, in 1686, the birth and death registers, till then kept voluntarily by the parish clergy, were made compulsory and general, the results for each year being communicated to a central office. A census, as a special undertaking, was not, however, carried out in that country until 1749. The example of Sweden was followed in the next year by Finland, and twenty years later, by Norway, where the parish register was an existing institution, as in the neighbouring state. Several other countries followed suit in the course of the 18th century, though the results were either partial or inaccurate. Amongst them was Spain, though here a trustworthy census was not obtained until 1857, or perhaps 1887. Some of the small states of Italy, too, recorded their population in the middle of the above century, but the first general census of that country took place in 1861, after its unification. In Austria, a census was taken in 1754 by the parish clergy, concurrently with an apportionment of the civil authorities and the military commandants. Hungary was in part enumerated thirty years later. The starting-point of the modern census, however, in either part of the dual monarchy, was not until 1857. Speaking generally, most of the principal countries began the current series of their censuses between 1825 and 1860. The German empire has taken its census quinquennially since its foundation, but long before 1871 a census at short intervals used to be taken in all the states of the Zollverein, for the purpose of ascertaining the contribution to the federal revenue, the amount of which was revisable every three years. The last great country to enter the census field was Russia. From 1721, what are known as revisions of the population were periodically carried out, for military, fiscal and police purposes; but these were conducted by local officials without central direction or systematic organization. In 1897 a general census was taken as synchronously throughout the empire as was found possible. It embraced a population second to that of India alone, as China, probably the most populous country in the world, has not yet been subjected to this test. The inquiry was made in great detail, under central control, and on a plan sufficiently elastic to suit the requirements of so varied a country and population. As in India, the schedules had to be issued in an unusual number of languages, and were dealt with locally in the earlier stages of tabulation. The principal regions of which the population is still a matter of mere conjecture are the Turkish empire, Persia, Afghanistan, China and the Indo-Chinese peninsula, in Asia, nearly nine-tenths of Africa, and a considerable portion of South America. (J. A. B.)

UNITED STATES

Modern census-taking seems to have originated in the United States. Professor von Mayr declares in a recent and authoritative work, "It was no European state, but the United States of America that made a beginning of census-taking in the large and true sense of the word," and Professor H. Wagner, writing of the censuses of Sweden, said to have been taken in the 18th century, uses these words, "Since 1749 careful parish registers have been kept by the clergy and have in general the value of censuses." The same authority, although mentioning a reported census of Norway in 1769, indicates his conviction that the first real census of that country was in 1815. Sweden, Norway and the United States are the only countries with any claim to have taken the first modern census, as distinguished from a register of tax-payers, &c., the lineal descendant of the old Roman census, and the innovation seems to be due to the United States. If so, the first modern census was the American census of 1790. At the present date more than three-fifths of the estimated population of the world has been enumerated in this way. It is of interest accordingly to note how and why the device originated. The Federal census, which began in 1790 and has been taken every ten years since under an mandate contained in the Constitution of the United States, was the outgrowth of a controversy in the convention which prepared the document. Representatives of the smaller states as a rule claimed that the vote, and so the influence, of the states in the proposed government should be equal. Representatives of the larger states as a rule claimed that their greater population and wealth were entitled to recognition. The controversy ended in the creation of a bicameral legislature in the lower branch of which the claim of the larger states found recognition, while in the upper, the Senate, each state had two votes. In the House of Representatives seats were to be distributed in proportion to the population, and the convention, foreseeing rapid changes of population, ordained an enumeration of the inhabitants and a redistribution within the states in the House of Representatives every ten years. The provision of the Constitution on the subject is as follows:—"Representatives and direct taxes shall be apportioned among the several states which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct."

In 1790 the population was reported classed as slaves and free, the free classed as white and others, the free whites as males and females, and the free white males as under or above sixteen years.
years of age. In 1800 and 1810 the same classification was preserved, except that five age-groups instead of two were given for free white males and the same five were applied also to free white females. In connexion with the census of 1819 an attempt, perhaps the earliest in any country, was made to gather certain industrial statistics showing “the number, nature, extent, situation and value of the arts and manufactures of the United States.” In 1820 a sixth age class was introduced for free white males, an age classification of four periods was applied to the free coloured and the slaves of each sex, and the number of aliens and of persons engaged in agriculture, in manufactures and in commerce was called for. The inquiry into industrial statistics begun in 1810 was also repeated and extended.

In 1830 thirteen age classes were employed for free whites of each sex, and six for the free coloured and the slaves of each sex. The number of aliens, of the deaf and dumb and the blind were also gathered.

The law under which the census of 1840 was taken contained a novel provision for the preparation in connexion with the census of statistical tables giving “such information in relation to mines, agriculture, commerce, manufactures and schools as will exhibit a full view of the pursuits, industry, education and resources of the country.” This was about the first indication of a tendency, which grew in strength for half a century, to load the Federal census with inquiries having no essential or necessary connexion with its main purpose, which was to secure an accurate enumeration of the population as a basis for a reapportionment of seats in the House of Representatives. This tendency was largely due to a doubt whether the Federal government under the Constitution possessed the power to initiate general statistical inquiries, a doubt well expressed in the 9th edition of the Encyclopædia Britannica by Francis A. Walker, himself a prominent member of the party whose contention he states:—

“The reservation by the states of all rights not granted to the general government makes it a matter of question whether purely statistical inquiries, other than for the single purpose of apportioning representation, could be initiated by any other authority than that of the states themselves. That large party which advocates a strict and jealous construction of the constitution would certainly oppose any independent legislation by the national Congress for providing a registration of births, marriages and deaths, or for obtaining social and industrial statistics, whether for the satisfaction of the publicist or for the guidance of the legislature. Even though the supreme court should decide such legislation to be within the grant of powers to the general government, the distrust and opposition, on constitutional grounds, of so large a portion of the people, could not but go far to defeat the object sought.

The difficulty stated in the foregoing quotation, although now mainly of historic importance, exerted great influence upon the development of the American census prior to 1900.

The pioneer work of the census of 1840 in the fields of educational statistics, statistics of occupations, of defective classes and of causes of death, suffered from numerous errors and defects. Public discussion of them contributed to secure radical modifications of scope and method at the census of 1850. Before the census law was passed, a census board, consisting of three members of the president’s cabinet, was appointed to draft plans for the inquiry, and the essential features of its report prepared after consultation with a number of leading statisticians were embodied in the law.

The census of 1850 was taken on six schedules, one for free inhabitants, one for slaves, one for deaths during the preceding year, one for agriculture, one for manufactures and one for social statistics. The last asked for returns regarding valuation, taxation, religions, statistics, pauperism, crime and the prevailing rates of wages in each municipal corporation. It was also the first American census to give a line of the schedule to each person, death or establishment enumerated, and thus to make the returns in the individual form indispensable for a detailed classification and compilation. The results of this census were tabulated with care and skill, and a preliminary analysis gave the salient results and in some cases compared them with European figures.

The census of 1860 followed the model of its predecessor with slight changes. When the time for the next census approached it was felt that new legislation was needed, and a committee of the House of Representatives, with James A. Garfield, then member for Ohio, as its chairman, and President Lincoln as its nominating authority, was created to take in hand the Census of 1860. The committee reported a bill for the purpose, which was introduced in both houses of Congress, and on March 3, 1860, passed the Senate and on March 4, 1860, the House, and was signed by the President on the same day. The act was 107 pages long, and was the first comprehensive law relating to the census.

The census of 1870 was taken with the outgrown machinery established twenty years earlier, a law characterized by Francis A. Walker, the superintendent of the census, who administered it, as “clumsy, antiquated and barbarous.” It suffered also from the fact that large parts of the country had not recovered from the ruin wrought by four years of civil war. In consequence this census marks the lowest ebb of American census work. The accuracy of the results is generally denied by competent experts. The serious errors were errors of omission, were probably confined in the main to the Southern states, and were especially frequent among the negroes.

Since 1870 the development of census work in the United States has been steady and rapid. The law, which had been prepared for the census of 1870 by the House committee, furnished a basis for greatly improved legislation in 1879, under which the tenth census was taken. By this law the census office for the first time was allowed to call into existence and to control an adequate local staff of supervisors and enumerators. The scope of the work was so extended as to make the twenty-two quarto volumes of the tenth census almost an encyclopædia, not only of the population, but also of the products and resources of the United States. Probably no other census in the world has ever covered so wide a range of subjects, and perhaps none except that of India and the eleventh American census has extended through so many volumes. The topics usually contained in a census suffered from the great addition of other and less pertinent matter, and the reputation of the work was unfavourably affected by the length of time required to prepare and publish the volumes (the last one not appearing until near the end of the decade), the original underestimate of the cost of the work, which made frequent supplementary appropriations necessary, the resignation of the superintendent, Francis A. Walker, in 1882, and the disability and death of his successor, Charles W. Seaton. The eleventh census was taken under a law almost identical with that of the tenth, and extended through twenty-five large volumes, presenting a work almost as encyclopædic, but much more distinctively statistical.

The popular opinion of a census, at least in the United States, depends largely upon the degree to which its figures for the population of the country, of states, and especially of cities, meet or fail to meet the expectations of the interested public. Judged by this standard, the census of 1890 was less favourably received than that of 1880. The enumerated population of the country in 1880 was larger than had been anticipated; and in the face of these figures it was difficult for local complaints, even if they were made, to find hearing and acceptance. But according to the census the decennial rate of growth of population fell suddenly from over 35 per cent in 1870 to under 25 per cent in 1880, and in every preceding decade of the century, except that of the Civil War, to less than 25 per cent, in spite of an immigration nearly double that of any preceding decade. For this change no adequate explanation was offered by the census office. Hence the protests of those who believed that the figures for population were too small swelled into a general chorus of dissatisfaction. But the census was probably more correct than the critics. Most of the motives influencing popular estimates of population in the United States tend to exaggeration.

The convention which drafted the Constitution of the United States attempted to secure a balance of interests by apportioning both representatives in Congress and direct taxes among the states. A passage in The Federalist suggests the motives of the convention as follows:—

"As the accuracy of the census to be obtained by Congress will necessarily depend in a considerable degree upon the selection of the enumerators, it is of great importance that the states should feel as little as possible to swell or reduce the
amount of their numbers. Were their share of representation alone to be governed by this rule, they would have an interest in exaggerating their inhabitants. Were the rule to decide their share of taxation alone, a contrary temptation would prevail. By exaggerating the rule to both objects the states will have opposite interests, which will control and balance each other, and produce a requisite impartiality.

With the disappearance of direct taxation as a source of federal revenue, the motive mentioned for underestimating the population disappeared. On the other hand, the desire for many representatives in Congress has been reinforced by the more influential feelings of local pride and of rivalry with other cities of somewhat similar size. Hence a complaint that the population is overstated is seldom heard, and hence, also, popular charges of an undercount afford little evidence that the population was really larger than stated by the census.

After the detailed tabulation had been completed, it was shown that the number of persons under ten years of age in 1890 was surprisingly small, and that this deficiency in children was a leading cause of the slow growth in population. Before the tabulation had been made Francis A. Walker wrote: "If the birth-rate among the previously existing population did not suffer a sharp decline ... the census of 1890 cannot be vindicated. To ascertain the facts we must await the tabulation of the population by periods of life, and ascertain how many of the inhabitants of the United States of 1890 were under ten years of age." These results thus confirmed the accuracy of the count of 1890. Efforts to invalidate the census returns by comparison with the registration records of Massachusetts cannot be deemed conclusive, since in the United States, as in Great Britain, the census must be deemed more accurate and less subject to error than registration records. A strong argument in favour of the eleventh census, apart from its self-consistency, is that its results as a whole fit in with the subsequent state enumerations. In eleven cases such enumerations have been taken; and on computing from them and the results of the federal census of 1890 on the population at the date of the seventh census should have been, if the annual rate of increase had been uniform, it appears that in no case, except New York City and Oregon, was the difference between the enumerations and these estimates over 4%. In Oregon about 30,000 more people were found in 1890 than the estimate would lead one to expect; in New York city, about 100,000 less. It seems not improbable that in the latter, where the difficulties incident to a count during the summer are almost insurmountable, serious omissions occurred. Still, such a comparison confirms the accuracy of the eleventh census as a whole.

The results of the twelfth census (1900) further refute the argument that would maintain the eleventh census to be inaccurate because it showed a smaller rate of increase in population during the preceding decade than had been recorded by other censuses during earlier decades. The rate of increase during the decade ending in 1900 was even less than that of the preceding decade; and it is impossible that a falling off so marked could have affected successive enumerations to such an extent as to indicate inaccuracy. The rate of increase from 1890 to 1900, eliminating from the computation the population of Alaska, Hawaii, Indian Territory and Indian reservations, was 20.7; the rate of increase if these places are included—in which case the figures of the population of Hawaii in 1890 must be taken from the census of the Hawaiian government in that year—was 21%.

The law regulating the twelfth census deserves to rank with those of 1870, 1850 and 1879 as one of the four important laws relative to census work. By this law the census office was far more independent than ever before. Appointments and removals were made by the President, after a long term of time, and when cases of the interior, and in all plans for the execution of the law the head of the office was responsible for success. The law divided the subjects of census inquiry into two parts—first, those of primary importance and the aid of the enumerator; and, secondly, those of subsidiary importance, capable of production without the aid of the enumerator. The former had to be finished and published by 1st July 1902; the latter were not to be undertaken until the former were well advanced towards completion. By this means the attention of the office could be concentrated on a small number of subjects rather than distributed over the long list treated in the volumes of the tenth and eleventh censuses.

Under the federal form of government, with its delegation of all residuary powers to the several states, the United States have no system of declaring births, deaths, and marriages. Here there is no such basis as exists in nearly every other civilized state for a national system of registration, and the country depends upon the crude method of enumerators' returns for its information on vital statistics except in the case of deaths which have been established, in some of the states or cities they are often made more complete than those in the state or municipal documents. The census of agriculture is liable to a wide margin of error, owing to defects in farm accounts and the inability of many farmers to state the amount or the value even of the leading crops. The census figures relate to the calendar year preceding 1st June 1900, and hurried and careless answers about the preceding year's crop are almost sure to have been given by many farmers in the midst of the summer's work.

The difficulties facing the manufacturing census were of a different character. A large proportion of the industries of the country keep satisfactory accounts, and can answer the questions with some system and exactness. It is merely a question of making the object of the census, and to fear that the information given will be open to the public or betrayed to competitors. Furthermore, the manufacturing schedule presupposes some uniformity in the method of keeping accounts, and Professor Francis A. Walker has this often lacking.

Another source of error in the manufacturing census of the United States is that the words of the census law are construed as requiring an enumeration of the various trades and manufacturing enterprises, such as, as the word 'manufacturing' sometimes is understood. As the returns are gross and numerous, but the census office feels obliged to seek for them and to report what it finds, however incomplete or incorrect the results may be. Even on the population returns certain states, such as those near ports, or the number unable to read and write, may be open to question.

The wide range of the American census, and the publication of uncertain figures, find a justification in the fact that the developing the country are not complete in all their processes in the office, and, above all, in the community. Rough approximations must always precede accurate measurements; and these returns, while often inaccurate, are better than nothing, and probably improve with each decade.

Besides the breadth of its scope, in which the American census stands unrivalled, the most important American contribution to census work has been the application of electricity to the tabulation of the results, as was first done in 1890, and the method by which this method reduced were two. The production of tables for so enormous a population as that of the United States through the method of tallying by hand requires a great number of clerks to work a long period of time, and the errors which can be verified except by a repetition of the process. The new method abbreviates the time, since an electric current can tally almost simultaneously the data, the tallying of which by hand would be separated by an unaccountable interval. The method of a census comparatively easy the verification of the results of certain questions.

Judged by European standards the cost of the American census is very great. The following table gives the total and the per capita cost of each enumeration.

For the sake of comparison it must be stated that the per capita cost of the English census of 1901 was 2-21d., less than one-tenth that of the American census. This difference is due in part to the greater scope and complexity of the American census, and in part to the fact that in the United States the field work is done by well-paid enumerators, while in England it is done in most cases by the heads of families, who are not paid.

The course of events has clearly established the fact that the authority of the Federal Government in the field of the strict constructionists of a previous generation as represented
by General Walker in the passage already quoted believed it to be.

Decision after decision of individual instances has made it a settled practice for the Federal government to co-operate with or to supplement the state governments in the gathering of statistics that may furnish a basis for state or Federal legislation. The Census Bureau has utilized the Federal census office in its discretion to compile and publish the birth statistics of divisions in which they are accurately kept; one Federal report on the statistics of marriages and divorces throughout the country from 1867 to 1886 inclusive was published in 1889, and a second for the succeeding twenty-year period was published in 1908-1909; an annual volume gives the statistics of deaths for about half the population of the country, including all the states and cities which have approximately complete records of deaths; Federal agencies like the bureau of labor and the bureau of corporations have been created for the purpose of gathering certain social and industrial statistics, and the bureau of census has been made a permanent statistical office.

The Census Bureau has engaged in the compilation and publication of statistics of many sorts. Among its important lines of work may be mentioned frequent reports during the cotton ginning season upon the amount of cotton ginned, supplemental census reports upon occupations, employees law has allowed the Census Bureau to collect and publish, and the further interpretation of various population tables, reports on street and electric railways, on mines and quarries, on electric light and power plants, on deaths in the registration area 1900-1904, on benevolent institutions, on the insane, on paupers in almshouses, on the social conditions of the insane and the paupers in almshouses in 1905, Congress has recently entrusted it with still further duties, and it has developed into the main statistical office of the Federal government, finding its nearest analogue probably in the Imperial Statistical Office in Vienna.

CENTAURIA, in botany, a genus of the natural order Compositae, containing between four and five hundred species, and of wide distribution, but with its principal centre in the Mediterranean region. The plants are herbs with entire or cut often spiny-toothed leaves, and ovoid or globose involucres surrounding a number of tubular, oblique or two-lipped florets, the outer of which are usually larger and neater, the inner bisexual. Four species are native in Britain. C. nigra is knapweed, common in meadows and pastureland; C. Cyanus is the blue bottle or cornflower, a well-known cornfield weed; C. Calochlora is a star-thistle, a rare plant, found in dry waste places in the south of England, and characterized by the rose-purple flower-heads enveloped by involucral bracts which end in a long, stiff spine. Besides cornflower, a few other species are worth growing as garden plants; they are readily grown in ordinary soil.—C. Euphorbia, a half-hardy perennial, native of Italy, is remarkable for its flowers, which are yellow and have long showy leaves and a tall spike of small yellow flowers; C. dealbata (Caucasus) is a low-growing plant with larger rose-coloured heads; C. macrocephala (Caucasus) has large yellow heads; C. montana (Pyrenees) large handsome blue heads; and C. ragusina (S.E. Europe) beautiful silver-haired leaves and yellow flowers.

CENTAURS, in Greek mythology, a race of beings part horse part man, dwelling in the mountains of Thessaly and Arcadia. The name has been derived (1) from *kresth* (good) and *rapos* (bull), implying a people who were primarily herdsmen, (2) from *kresth* and the common termination -*upos* or *lep* (*air*), *i.e.* "spearmen." The former is unsatisfactory partly from the philological standpoint, and the latter, though not certain, is preferable. The centaurs were the offspring of Ixion and Nephele (the rain-cloud), or of Kentaurus (the son of these two) and some Magnesian mares or of Apollo and Hebe. They are best known for their fight with the Lapithae, caused by their attempt to carry off Deidameia on the day of her marriage to Peirithous, king of the Lapithae, himself the son of Ixion. Theseus, who happened to be present, assisted Peirithous, and the Centaurs were driven off (Plutarch, *Theseus*, 30; Ovid, *Metam.*, *xii.*, 273; *Diod. Sic.*, iv. 69, 70). In later times they were often represented drawn with various wild or bound and ridden by Eros, in allusion to their drunken and amorous habits. Their general character is that of wild, lawless and inhospitable beings, the slaves of their animal passions, with the exception of Pholus and Chiron. They are variously explained by a fancied resemblance to the shapes of clouds, or as spirits of the rushing mountain torrents or winds. As children of Apollo, they are taken to signify the rays of the sun. It is suggested as the origin of the legend, that the Greeks in early times, to whom riding was unfamiliar, regarded the horsemen of the northern hostiles as one and the same with their horses; hence the idea of the Centaur as half-man, half-animal. Like the defeat of the Titans by Zeus, then, the contest with the Centaurs typified the struggle between civilization and barbarism.

In early art they were represented as human beings in front, with the body and hind legs of a horse attached to the back; later, they were men only as far as the waist. The battle with the Lapithae, and the adventure of Heracles with Pholus (Apollodorus, ii. 5; *Diod. Sic.*, iv. 218) are the favourite subjects of Greek art (see Sidney Colvin, *Journal of Hellenic Studies*, i. 1881, and the exhaustive article in Roscher's *Lexikon der Mythologie*). Fig. 24 in article GREEK ART (the west pediment of the temple of Zeus at Olympia) represents the attempt of the Centaurs to carry off the bride of Peirithous.

CENTAURUS ("the Centaur"), in astronomy, a constellation of the southern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), Ptolemy catalogued thirty-seven stars in it. α-Centaurs is a splendid binary star. Its stars are about the first magnitude, and revolve in a period of eighty-one years; and since its parallax is 0.75", it is the nearest star to the earth; ω-Centaurs, the finest globular star-cluster in the heavens, consists of about 6000 stars in a space of about 20' diameter, of which about 25 variables have been examined. Nova Centauri, a "new" star, was discovered in 1855 by Mrs Fleming in photographs taken at Harvard.

CENTAURY (Erythraea Centaurium, natural order Gentianaceae), an annual herb with erect, smooth stem, usually branched above, and a terminal inflorescence with numerous small red or pink regular flowers with funnel-shaped corolla. The plant occurs in dry pastures and on sandy coasts in Britain, and presents many varieties, differing in length of stem, degree of branching, width and shape of leaves, and laxity or closeness of the inflorescence. Several other species of the genus are grown as rock-plants.

CENTENARY (from Lat. centenarius, of or belonging to a hundred, from centum, distributive of centum, hundred), a space of a hundred years, and particularly the celebration of an event on the lapse of a hundred years, a centennial anniversary. The word "centennial" (from Lat. *centenarius*, from *centum*, a year), though usually an adjective as in "the Centennial State," the name given to Colorado on its admission to statehood in 1876, is also used as a synonym of centenary.

CENTERVILLE, a city and the county-seat of Appanoose county, Iowa, U.S.A., in the south part of the state, about 90 m. N.W. of Keokuk. Pop. (1890) 3668; (1900) 4256; (1905, state census) 6937 (487 being foreign-born); (1910) 6936. Centerville is served by the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific and the Iowa Central railways. Among the principal buildings are the county court-house and the Federal building, and the city has a public library and a hospital. It is in one of the most productive coal regions of the state; it ships coal, limestone and livestock, has large bottling works, and manufactures iron, brick and tile, machine-shop products, woolen goods, shirts, cigars and flour. The place was platted in 1846, was called Chaldea until 1849, when the present name was adopted, was incorporated as a town in 1855, and in 1870 was chartered as a city of the second class. The city limits were extended in 1906-1907.

CENTIPEDES, the characteristic member of the group Chilopoda, a class of the Arthroplea, formerly associated with the Diplopoda (Millipedes), the Pauropoda and the Symphyla, to constitute the now abandoned group Myriapoda. The resemblance between the three classes is evident, but closer examination shows the Diplopoda and Symphyla to be unrelated, and the Chilopoda (centipedes) to be related to the Arachnida, due to the elongation and vermiform shape of the body, which in both is composed of a number of similar or subsimilar somites not differentiated as are those of Insecta, existing Arachnida and and most Crustacea, into series or "tagmata" of varying function. Until 1893 no one doubted the correctness of the assumption that the Chilopoda and Diplopoda were orders of a class Myriapoda of the same systematic status as the Arachnida or Hexapoda. But in that year, R. I. Pocock and J. S. Kingsley independently pointed out that they differ as much from each other as either differs from the Hexapoda; and should, therefore,
rank as distinct classes of Arthropods. Pocock, indeed, definitely associated the Chilopoda with the Hexapoda in a group, the Opisthobronta (Opisthobronta), equivalent to a group, the Progonata (Prosogonea), comprising the Diplopoda, Pauropoda, and Symphyta. As the basis for this classification was taken the position of the generative orifices which open in the Opisthobronta at the posterior end and in the Progonata near the anterior end of the body. As a matter of fact, in the Chilopoda they are situated on the penultimate or preanal somite; in the Hexapoda on the antepenultimate somite (male) or a little farther forward (female). Moreover, the recent researches of Heymons into the embryology of Scolopendra, one of the Chilopoda, has shown a close correspondence in the number of cephalic metameres between the Chilopoda and Hexapoda, a correspondence which has not yet been established in the case of the Diplopoda or Symphyta. This last discovery bears out the view of relationship between the centipedes and insects, to the exclusion of the Diplopoda, Symphyta and Pauropoda. But even if in the future it can be shown that all these groups can be brought into line with respect to the metameric character of the head, the position of the generative orifices will remain as a fundamental and constant character, distinguishing the Chilopoda from the other groups of so-called “Myriapods” and the Hexapoda from the Symphyta, in which many particulars they resemble.

Structure of the Chilopoda.—The exoskeletal elements of a typical somite consist of a dorsal plate or tergum, a ventral plate or sternum, a lateral or pleural membrane, often strengthened with chitinoid sclerites, and a pair of appendages. At the anterior extremity there is a head-sclerite or cephalite, which bears eyes, when present, and a pair of antennae. In all centipedes, except the Scutigeridae, the preanterior portion of the cephalite is sharply reflexed, ventrally forming an area called the Clypeus. The inner edge of this bears the labrum, which is usually represented by a small median, and two lateral pairs of palp-like organs, the clypeus. On either side of the former are the antennae, four pairs of jaws or gnathites, a variable number of walking legs and a single pair of generative limbs or gonapod. The antennae, articulated to the forepart of the head and preoral in position, are often secondarily homologized to other appendages. The jaws of the first pair of mandibles are stout and bi-segmented, with a dentate cutting edge. Those of the second pair or maxillae vary considerably in structure in different groups. They are usually reduced and are used in birthing. The second and third pairs of the antennae, and the first two or three pairs of the maxillae are usually well developed. The second pair of maxillae, and sometimes the third pair, are modified for sensory functions. The maxillary plate of the second maxilla bears the sensual organ, which is usually represented by a single lamella, and is attached to the postero-lateral angle of the tergum of the segment. The anterior appendages of the maxilla are often reduced, and the sensory organ of the second maxilla, a small, cone-like organ, is usually present, and is sometimes absent.

The classification of Scolopendra has shown that the antennae of the adult are the appendages of the second postoral segment (Scutigera) and the mandibles, those of the fourth, the first and second mandibles, those of the second maxillae. The fourth pair of maxillae is involved in the development of the genital segments, and the fifth pair of maxillae is always developed, though sometimes reduced. The maxillary plates of the second maxillae, and sometimes the third pair, are modified for sensory functions. The maxillary plate of the second maxilla bears the sensual organ, which is usually represented by a single lamella, and is attached to the posterior angle of the tergum of the segment. The anterior appendages of the maxilla are often reduced, and the sensory organ of the second maxilla, a small, cone-like organ, is usually present, and is sometimes absent.

But even if in the future it can be shown that all these groups can be brought into line with respect to the metameric character of the head, the position of the generative orifices will remain as a fundamental and constant character, distinguishing the Chilopoda from the other groups of so-called “Myriapods” and the Hexapoda from the Symphyta, in which many particulars they resemble.

Scolopendra, where there are four, the corneal lens is a biconvex thickening of the cuticle. The soft or retinal portion of the eye beneath the lens consists of an aggregation of large cells forming a single layer continuous with the epidermic cells of the circumanal area. Thus the eye is monochromatic and the arrangement of the cells, however, is peculiar. They are invaginated to form what may be described as a very deep cup with exceedingly thick walls and correspondingly narrow median space, the outer surface of the cup being formed by the inner or proximal ends of the cells and the inner surface by their outer or distal ends. It results from this arrangement that the cells forming all but the bottom of the invagination lie horizontally, i.e., at right angles to the vertical axis of the eye. From the distal ends of the cells are secreted chitinous rhabdomeres, forming a rhabdom which occupies and fills up the central portion of the eye beneath the middle of the corneal lens. The outer ends of the cells are nucleated and are continuous with the fibres of the optic nerve, large accessory glands; and a pair of tubes, or vesiculae seminai, open, one on each side, into the divided sperm ducts close to their point of origin above the intestine.

The organs of the female are very similar. There is a large median ovary followed by a short oviduct forming a circum-intestinal collar and a common atrium. Into the latter open a pair of short receptacula seminis and the slender duct of two pairs of large accessory glands. There is nothing in the female corresponding to the supra-intestinal vesiculae seminales of the male. In the male of Scolopendra, on the contrary, there are as many as twelve pairs of somewhat sausage-shaped testes, approximately two from each pair proceeding two slender ducts which open into a median duct coiled in the posterior third of the body and much expanded in the last three of the leg-bearing segments. The right and left portions of the intestinal ring of the genital duct are unequally developed, and there are no vesiculae seminales, but two pairs of accessory glands communicate with the genital atrium as in Lithobius. In the female Scolopendra the right and left portions of the intestinal collar are also unequally developed, and only a single pair of accessory glands besides the receptacula seminis open into the atrium.

The heart is tubular and lies in the middle dorsal line immediately

beneath the integument. It consists of a series of chambers corresponding roughly to the leg-bearing segments, and lies in a blood-sinus formed by a pericardial membrane whence large alary muscles extend to the sides of the body. Each chamber gives off in Sco-lopendra a pair of fine lateral vessels, and is furnished at its posterior extremity with a pair of orifices by which the blood re-enters the organ from the pericardial space. From the anterior chamber, which lies in the first or second leg-bearing segment, proceed three arteries, a median which runs forwards into the head to supply the brain and other organs, and a lateral which with its fellow of the opposite side forms an oesophageal aortic collar. From the sides of the latter arise vessels to the gnathites, and from its inferior portion an unpaired vessel passes forwards into the head and another backwards above the nerve chord to the posterior end of the body, supplying each segment in its course with a delicate lateral branch. In Sco-lopendra the chambers of the heart, excepting the first and last, which are small, are subequal in size; but in forms like Scutigera where the terga are very unequal in size a corresponding inequality in the size of the chambers is manifested.

In all centipedes, except Scutigera, respiration is effected by chitinized tracheal tubes which extend with their ramifications throughout the body and open to the exterior by means of spiracles perforating the lateral or pleural membrane of more or fewer of the somites below the edge of the terga. Spiracles are never present upon the anal, genital and last leg-bearing somites, and only rarely, as in Henicopta, upon the somite bearing the legs of the first pair. In the majority of cases the spiracles are circular, sigmoid or slit-like orifices, with chitinized rim, leading into a pocket-like integumental infolding, from which emanate numerous small tracheal tubes which soon anastomose to form the main tracheal trunks. In Ducetium, one of the Sco-lopendridae, there is no pocket-like infolding, the small tracheal tubes opening direct to the exterior on a large subcircular plate where their apertures fuse to form a complicated network. The apertures, as in the case of other genera, are protected by fine hairs; and the tracheae themselves are strengthened by a fine spiral filament. In the Lithobidae the tracheae do not anastomose; but in Sco-lopendra and Geophilus the main trunks in each segment fuse transversely with those of the opposite side and also longitudinally with those of the proceeding and succeeding segments. In Scutigera the tracheae differ both in structure and position from those of all other Chilopoda. The spiracles, unpaired and seven in number, open in the median dorsal line. Each leads into a short sac from which five tracheal tubes depend into the pericardial blood-sinus.

Existing Chilopoda may be classified as follows, into five orders referable to two subclasses—

**Subclass I. Pleurostigmata.**

Order 1. Geophilomorpha.

Order 2. Sco-lopendromorpha.

Order 3. Craterostigmomorpha.

Order 4. Lithobiomorpha.

**Subclass II. Notostigmata.**

Order 5. Scutigeromorpha.

**SUBCLASS I, PLEUROSTIGMA.**—Chilopods furnished with a rich system of branching tracheal tubes, the spiracles of which are paired and open upon the pleural area of more or fewer of the somites. Each leg-bearing somite contains a distinct tergum and sternum, the number of sterns never exceeding that of the terga. Eyes are either preserved or lost; when preserved they are represented either by a single one-lensed ocellus or by an aggregation of such ocelli on each side of the head. The anterior portion of the head, bearing the labrum, is bent sharply downwards and backwards beneath the larger posterior portion lying behind the antennae, so that these appendages, approximated in the middle line, project directly forwards from the margin of the head formed by this retroversion of the labral area. The maxillae are short and have no sensory organ; the palpognaths consist of four segments, and the toxicognaths have their basal segments fused to form a single coxal plate.

**Order 1. Geophilomorpha.**—Chilopods with a large and indefinite number of somites, most of which are partially or completely divided into a smaller anterior segment, represented by a pretergal and two pretergal sclerites, and a larger posterior segment bearing the spiracles and legs. The latter segments are present upon all the leg-bearing somites except the first and last; and the legs which are short and subequal in length consist of six segments, the basal of which remains small. There are no eyes, and the antennae consist invariably of four segments. The tergal plates of the somite bearing the toxicognaths always remain distinct and separates the head-shield from the tergum of the first leg-bearing somite. The penultimate and antepenultimate segments of the toxicognaths are reduced on the preaxial side of the appendage to the condition of arthrodeial integumental folds and suppressed on the postaxial side where the distal segment or fang is firmly jointed to the femoral segment. In the last leg-bearing somite the pleural sclerites coalesce with the coxa of the appendage; while the second segment (trochanter) of this appendage does not fuse with the third (femur). The genital and anal somites are not retractile within the last leg-bearing somite, and the gonopods typically persist in the male as small two-jointed appendages and in the female as joined or unjointed sclerites. The young are hatched with the full number of segments.

The Geophilomorpha are universally distributed in suitable localities. The number of families into which the order should be divided is as yet unsettled, some authors admitting several groups of this rank, others referring all the genera to a single family, Geophiliidae. Inhabiting the Geophilidae are mostly subtropical, living in the earth and feeding principally upon earthworms. Occasionally they may be found eating fruit or fungi, probably for the sake of moisture. Although without eyes, they are extremely sensitive to light, and when exposed to it crawl away in serpentine fashion to the nearest sheltered spot, feeling the way with their antennae. They
can, however, progress with almost equal facility backwards, using the legs of the posterior pair as feelers. Differing from the majority of the family in habits are the two species Linnotaena maritima and Schendyla submarea, which live under stones or seaweed between tide-marks on the coast. Most of these species are provided with glands, which open upon the sternum and secrete a fluid which in some forms (Himantarium) is blood-red, while in others it is phosphorescent. In the tropical form Orphaea phosphorous the fluid is likewise luminous. Its posterior legs are only nine-jointed, and its uniformity is lost, especially observed in England in the autumn in the case of Linnotaena acuminata and L. crassipes.

The number of pairs of legs within this family varies from between thirty and forty to over one hundred and seventy. These variations are observable in size, the smallest specimens being less than an inch in length. The larger specimens, on the other hand, are of some length.

Tropical families of Scolopendridae include the genus Schendyla, the subgenus of the latter Cryptops, and the genus Lithobion of the family Schendylidae, but with only fifteen pairs of legs as in the Lithobiomorpha. As in some members of the latter order there is a single pair of antennae on each side of the head, the unipapillate and unipennate segments of the antennae are completely regular. The legs and spiracles are present upon the 3rd, 5th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, and 15th leg-bearing somites. In the latter pair of legs, the spiracles are present upon the 17th leg-bearing somite.

The direction of the antennae varies from east to west in the family, but the direction is always the same in the individual. The terminal portion of the somite is always directed towards the head. The antennae of the first pair are coalesced with one another, and their number is divisible into three segments.

The antennae are also divisible into three segments, and the first and last of these are the only one-segmented antennae, which are represented in the family and order. Thus the first antennae are represented by a pair of chitinuous valves capable of opening below for the escape of the genital and intestinal products.

This order, containing the family Craterostigmidae, is based upon the remarkable genus and species Craterostigma tasmianum, of which only a few specimens are known. These were collected under stones upon the summit of Mount Rumney in Tasmania. They are about 1 1/2 inches in length, but nothing has been recorded of their mode of life.

The chief morphological interest attaching to Craterostigma is that, apart from certain structural peculiarities of its own, it presents features previously believed to be found exclusively in the Scolopendromorpha, or the Geophilomorpha, and Lithobiomorpha; and it shows how the Lithobiomorpha may be derived from a Scolopendromorphus type most nearly resembling the suborder of the third, sixth, ninth, eleventh, fourteenth, and eighteenth leg-bearing somites.

dorsal tracheal sacs furnished with tubes dipping into the pericardial blood space, and opening each by an unpaired spiracle upon the 1st, 3rd, 5th, 8th, 10th, 12th and 14th leg-

Fig. 9.—A, Scutigera rubrolineata (after Bullon). B, Tergum and part of a second of the same enlarged to show the position of the stigmata a, o, p; hinder margin of tergum.

bearing somites. This characteristic is accompanied by the complete disappearance of the tergum of the 7th, either by fusion with that of the 8th or by excision, and by the evanescence of the terga of the 2nd, 4th, 6th, 9th, 11th and 13th pedigerous somites. The preanterior area of the head is not strongly reflexed inferiory, and the eyes are large and compound. The maxillae are long and have a sensory organ; the palpognaths are long, spiny and composed of five segments, like the primitive Chilopod leg, and the toxiconnaths have their basal segments disuniited and independently movable. Gonopods duplicated in the male.

This subclass contains the single order Scutigeromorpha and the family Scutigeridae. As in the Lithobiomorpha there are fifteen pairs of legs, the gonopods are well developed in both sexes and the young are born alive and not hibernating. The legs are long and slender, as in the structure the Scutigeridae, of which Scutiger is the best-known genus, differ greatly from other centipedes. Although they hide under stones and logs of wood like Lithobius, they are not lucifugal but diurnal, and may be seen chasing their foes in the blazing sun. They run with astonishing speed and have the power of dropping their legs when seized. South of about the 40th parallel of north latitude they are universally distributed in suitable localities. In most species the body only reaches a length of about 1 in., but there are species that are as much as 6 in. and 1 ft. as seen in examples of the Indian species Scutiger longicornis.

Some fossils of Carboniferous age have been described as Chilopoda by Scudder, who refers them to two families, Geracostigideridae and Eoscolopendridae. But until the specimens have been examined by zoologists the genera are alleged to represent cannot be taken seriously into consideration. Remains of centipedes closely related to existing forms have been recorded from Oligocene beds. (K. F. P.)

CENTLIVRE, SUSANNA (c. 1667-1723). English dramatic writer and actress, was born about 1667, probably in Ireland, whither her father, a Lincolnshire gentleman named Freeman, had been forced to flee at the Restoration on account of his political sympathies. When sixteen she married the nephew of Sir Stephen Fox, and on his death within a year she married an officer named Carroll, who was killed in a duel. Left in poverty, she began to support herself, writing for the stage, and some of her early plays are signed S. Carroll. In 1706 she married Joseph Centlivre, chief cook to Queen Anne, who survived her. Her first play was a tragedy, The Purged Husband (1700), and she herself appeared for the first time at Bath in her comedy Love at a Venture (1706). Among her most successful comedies are—The Groomster (1705); The Happy Valley (1709); A Bold Stroke for a Wife (1718); The Basset-table (1706); and The Wonder! A Woman keeps a Secret (1714), in which, as the jealous husband, Garrick found one of his best parts. Her plots, verging on the farcical, were always ingenious and amusing, though coarse after the fashion of the time, and the dialogue fluent. She never seems to have acted in London, but she was a friend of Rowe, Farquhar and Steele. Mrs Centlivre died on the 1st of December 1723. Her dramatic works were published, with a biography, in 1761 (reprinted 1872).

CENTO, a town of Emilia, Italy, in the province of Ferrara, 18 m. S.E. direct from the town of Ferrara; 50 ft. above sea-level; it is reached by road (6 m. to the W.) from the station of S. Pietro in Casale, 15 m. S.W. by W. of Ferrara, and also by a steam tramway (18 m.) from Bologna to Pieve di Cento, on the opposite bank of the Reno. Pop. (1901) 4307 (town), 19,078 (commune). It is connected by a navigable canal with Ferrara. It was the birthplace of the painter Giovanni Francesco Barbieri (Guercino). The communal picture-galley and several churches contain works by him, but none of first-rate importance. A statue of him stands in front of the 16th-century Palazzo Governativo. The town was surrounded by walls, the gates of which are preserved. The origin of the name is uncertain.

CENTO (Gr. κέντον, Lat. cento, patchwork), a composition made up by collecting passages from various works. The Byzantine Greeks manufactured several out of the poems of Homer, among which may be mentioned the life of Christ by the famous empress Eudoxia, and a version of the Biblical history of Eden and the Fall. The Romans of the later empire and the monks of the middle ages were fond of constructing poems out of the verse of Virgil. Such were the Cento Nuptialis of Ausonius, the sketches of Biblical history which was composed in the 15th century by Proba Falconia, wife of a Roman proconsul, and the hymns in honour of St Quirinus taken from Virgil and Horace by Metellus, a monk of Tegernsee, in the latter half of the 12th century. Specimens may be found in the work of Aldus Manutius (Venice, 1504; Frankfort, 1541, 1544). In 1555 Laelius Capitolus produced from Virgil an attack upon the dissolute lives of the monks; in 1536 there appeared at Venice a Petrarca Spiritualae; and in 1634 Alexander Ross (a Scotsman, and one of the chaplains of Charles I.) published a Virgilii Evangelienses, sua Historia Domini nostri Jesu Christi Virgilianis verbis et versibus descrip.
Physical Features.—The Cordilleras, or mountain chains of Central America do not form a complete link between the western ranges in the north and south of the continent, for their continuity is interrupted by various depressions, of which the chief is the lacustrine basin of Nicaragua. But in the east of the Paleozoic area, the Central American chain is continuous from end to end, their main axis trending north-west to south-east. They do not, as a rule, rise in sharply serrated ridges or series of volcanic crests, like the Andes, but the central Cordilleras are disposed in a succession of mountain masses, with many lesser chains radiating from them. The principal summits have an altitude of 12,000 and even, in a few cases, of 13,000 ft., and the general character of the ranges is volcanic, many craters being still active. Large tracts of land remained imperfectly surveyed at the beginning of the 20th century, owing to the unhealthiness of the tropical climate, and the dense underwoods which impede exploration.

In the northern part of Guatemala, on the Pacific coast of the same country, in British Honduras, along the Segovia river, on the Mosquito Coast, and in the basin of Lake Nicaragua and the San Juan river, there are broad stretches of comparatively flat country. The main line of watershed is everywhere nearer to the Pacific than to the Atlantic, except in southern Costa Rica and Panama, where it is almost invariably nearer to the Atlantic. In consequence, the majority of the rivers of the Pacfic seaboard are mostly short and swift,—mere mountain torrents, in many instances, until they reach the sands and swamps which border the sea. The rivers of the Atlantic littoral descend more gradually, and by longer channels. In particular, the Segovia, in Nicaragua and Honduras, which has a course of 450 m. Lake Nicaragua, the largest inland sheet of water, has an area exceeding 3500 sq. m. There are also several mountain lakes of exceptional size, such as those to the north of Lake Nicaragua, besides two great land-locked salt-water lakes—the Pearl Lagoon of the Mosquito Coast, and the Carataska Lagoon in Honduras.

Geology.—The neck of land which unites the continents of North and South America is not, geologically, the direct continuation of either, but constitutes a third element which is wedged, as it were, between the other two. The folds in the earth's crust which form the Andes and the western ranges of North America, are not continued along the connecting isthmus, neither, on the contrary, are the strata folded from west to east, obliquely across the trend of the continent. It should, however, be noticed that the Andes, as they approach the Caribbean sea, bend round towards the east, and it is probable that the folds of the Northern range similarly bend eastward beneath the volcanic rocks of Mexico. The folds of Central America are tangential to the two arcs thus formed.

By far the greater part of Central America and Mexico is covered by Cretaceous and Tertiary deposits, both sedimentary and volcanic; but the foundation on which they rest is exposed at intervals. From the Rio Grande to the southern declivity of the Mexican plateau the existence of ancient crystalline rocks at the surface is yet unproved, but they probably occur in the Sierra Madre del Pacifico. South of the plateau, in the state of Oaxaca, low mountain ridges composed of granites and gneisses, supposed to be of Archaean age, strike from west to east, and may be the traces of the series of east and west folds which stand en éclat on the Central American region. Between the 15th and 17th parallels of latitude, in the state of Chiapas and in the republic of Guatemala, there is a second group of ridges composed of granites and schists with an eastward trend. In this case, the evidence of age is clear, for the rocks are covered by a limestone which is proved to be Pre-Carboniferous. Similar rocks, supposed to be of Archaean or at least of early Palaeozoic age, occupy considerable areas in British Honduras, Honduras and northern Nicaragua, and occur also in Costa Rica and perhaps in Panama; and wherever the strike has been observed, it is approximately from west to east. The rocks of the same age are not found in the adjacent state of Chiapas, where limestones have been found containing many unmistakable Carboniferous fossils, and below these is a considerable thickness of beds supposed to be Silurian. But in the Panamanian region is there any palaeontological evidence of Palaeozoic rocks.

The Mesozoic series begins with sands and red or yellow clays containing plant remains and possibly of Triassic age; but the occurrence of these is limited, and small isolated areas of the humid beds have been found in Mexico but not in Central America. The Cretaceous system, consisting of a lower series of clays, sandstones and conglomerates, followed conformably by an upper series of limestones, covers a considerable area in Chiapas, Guatemala and Honduras, and is found also in Costa Rica. The upper series contains hippurites. The greater part of the eastern half of the Mexican plateau is also formed of Cretaceous beds.

The Tertiary system may be conveniently divided into two divisions, the older, which lies between the sea, the higher part of the moderned ranges, and the northern part of the Guatemalan region, is similar to the older rocks of North America. The southern extremity of the Mexican plateau to the Colombian border, the strike of the folds—of the Mesozoic and early Tertiary deposits, as well as of the oldest rocks—is generally from east to west; but the rocks of the western coast of Mexico and in southern Lower California are nearly horizontal. The extent of the volcanic deposits is very great, and in a wide area they entirely conceal the original structural features of the country. The eruptions began towards the close of the Cretaceous period and continue to the present day. The rocks are lavas and ashes, chiefly of andesitic or basaltic composition, but rhyolites and trachytes also occur, and phonolite has been met with but rarely or in two places only.

According to R. T. Hill, there is but little geological evidence of any Tertiary or lower connexion between the Caribbean Sea and the Pacific, excepting, perhaps, a shallow opening during the Eocene period. It is held, however, that the strata do not agree upon this point, and K. Sapper found marls and sandstones which he believes to belong to the Upper Tertiary, lying horizontally at a height of about 7500 ft. in the Mexican state of Chiapas. Unfortunately the fossiliferous beds are not well preserved.

Climate.—The climate of Central America is subject to the most marked local differences of heat and cold, owing partly to the proximity of two oceans, partly to the variations of altitude which render the different territories of the mainland of British Honduras and northern Guatemala, totally unlike the alpine regions of Salvador and Costa Rica. The whole area may, however, be roughly divided into a tropical zone (tierra caliente), a temperate zone (tierra templada), and a cool zone (tierra fría). The temperature between 1500 and 5000 ft.; and a cold zone (tierra fría), above 5000 ft. These figures are, of course, only approximately correct; and it often happens that, at the same elevation, the heat is greater to the south; the heat of the tropical zone is greater for several months of the year than that of the temperate zone, and in the Pacific slope varies in duration from four to six months, between April and December. It lengthens as the altitude increases. On the coast, it corresponds with the prevalence of the south-west monsoon, the tempestuous Cordilleras de San Francisco, or "Flagellation of St. Francis," as it is called in Mexico, and it is often interrupted by an interval of two or three weeks of fine weather, known as the Veranillo de San Juan, or "Little summer of St. John." In the coastal region, the rainy season is at times very long, being from two to three months. In the afternoon the clouds begin to gather in great cumulus masses; suddenly the lightning flashes out and the rain crashes down; and by evening the sky is clear and starry. North of the equator, the trade-winds bring rain in any month, and, owing to the moist atmosphere, the heat is more oppressive. The rainfall may vary in successive years from less than 50 in. to nearly 200 in., owing to the occurrence of cloud-bursts. Frosts are not rare above 7000 ft., but snow seldom falls.

Fauna.—The fauna of Central America is more closely connected with the fauna of South than with that of North America. As the
region is comparatively small, and its limits conventional, there are comparatively few species that it can claim as peculiarly its own. It is almost entirely free from the presence of animals dangerous to man. Of felines it possesses the jaguar (Panthera onca), popularly called the tiger; the cougars (Felis concolor), popularly called mountain lions (Puma concolor), and the ocelot (Leopardus pardalis). The latter is sometimes kept tame; and other species. Several species of monkeys (Cebus and Atelis) are numerous in the warm coast region. The Mexican deer (Cervus mexicanus) has a wide range both in the lowlands and highlands. Besides birds of passage, there are several kinds of land birds, besides rats, hares and rabbits, the fruit-eating cotorra and tepes- cuinte (Dasyprocta aguti and Coelogenys paca), and the troublesome Geomyx mexicana. The manatee is common in all the larger streams. Wild pig, are occasionally seen by the inland lakeside called the tucanuce, or the Didelphis carinosa, its allied species. The hats are so numerous that villages sometimes had to be left to their undisputed occupancy. In the south-east of Costa Rica the live-stock, before the swarms of large migratory vipers which in a single night can bleed the strongest animal to death. Most of the domestic animals—the ox, goat, sheep, pig, dog, rabbit, camellia, and poultry—are of European origin, and are popularly grouped together as animales de Castilla. For the bird collector there is a rich harvest. The botanical Museum at Washington shows that Costa Rica alone possesses more than the botanically important species of flora and fauna. The birds of prey are sufficiently mentioned (Coragyps atratus, the commonest of the vultures, which acts as a universal scavenger, the Cathartes aura, the beautiful Polyborus vulgaris, and the king of the vultures Sarcorhamphus aequinoctialis), as are the southern continent or the northern eagles are known. The parrot, macaw, and toucan are found in all parts; the crow, blackbird, Mexican jay, ricebird, swallow, rainbow, woodpecker, hummingbird and trogon are also generally distributed. A bird of the last-named genus, the quetzal, quaint and quaint is of special note, not only from the fact that its yellow tail-feathers, 2 or 3 ft. long, were formerly worn as insignia by the Indian princes, but because it has been adopted as the emblematic figure of the nation. The woodpecker (Campephaga) is well represented, and comprises several peculiar species, as the pavo de cacho, and the peten turkey (Meleagris ocellata), which has a bronze sheen on its plumage; and aquatic birds, it is almost needless to say, are found in numerous in a region so richly furnished with lagoons, rivers and lakes.

Besides the alligator, which swarms in many rivers, the almost endless varieties of Central American reptiles include the harmless boa, or chicken-panko; python and pitibia; the venado, or corall, taboas, culibca de sangre and rattlesnake; iguanas of great size, scorpions, edible lizards and other lizards said to be poisonous. In the rivers and lakes, as in both seas, fish of many kinds abound; particularly there are the moravia, or moray eels, the minnow, the piranha, the oyster fishes. Insect life is even richer and more varied. Of the Coleoptera, the Cucurbitidae, the Corcoridae, and the Chrysomelidae are said to be best represented, and of the Lepidoptera, the Lepidoptera Motiles.—There are many species of them, which are— among others—those of the genera Espeletia and Bombyx. There are five species of bees, and the European honey-bee, known as vario de Castilla or "honey of Castile," has been naturalized. Ants are common, and may sometimes be seen marching in multitudes as far as the eye can reach. The locust are unfortunately no less plentiful in certain districts, but their flight varies greatly, the mosquito being almost unknown in parts of Honduras. A curious species of butterfly is the Timelesd Chiron, which migrates in countless multitudes from the forests of Honduras to the sea, to the shore of the lower keys.

Flora.—The flora of Central America ranges from the alpine to the tropical, with the transition from one climatic zone to another. Although its forest growths are, on the whole, inferior in size to those of central Mexico, they abound in magnificence. It is exceeded in many respects by those of the Philippine Islands. There are more than 100 species of palm, and orange, grapefruit, mango, and alligator are grown in abundance in mahogany, cedars, rosewood, ironwood, rubber, gum, copal, vanilla, sarsaparilla, logwood and many other dye-woods, medicinal plants, and valuable timber. Conspicuous amongst the timber trees is the splendid Cocal palm (Cocos butyracea), with feathery leaves 15 to 20 ft. long, golden flowers 3 ft. high, and a sap which if fermented produces the intoxicating chicha or vino de Cocal. In Guatemala occurs the remarkable Honduras tree, a "chocolate tree," whose seeds yield a finer flavored chocolate than the cocoa itself. The same country is famous for its magnificent orchids, huge arbores-
history of the Central American republics has been largely a record of civil war, maladministration and financial dishonesty, is perhaps due in part to racial inferiority. In part, however, it may be explained by the absence of any tradition of good government, perhaps also by the brevity and artificiality of the evolution which converted a debased slave-populace into the citizens of modern democratic states. The five divisions of “Guatemala” were temporarily incorporated in the Mexican empire during 1822, but regained their autonomy (as Guatemala, Honduras, Salvador, Nicaragua and Costa Rica) on the declaration of a Mexican republic, and in July 1823 combined to form the Republic of the United States of Central America. The Liberal or Federalist party, which was supreme in Honduras, found itself opposed by the Conservatives, including the clergy and former Spanish officials, who were very influential in Guatemala. A bitter and protracted struggle ensued. In 1837-1839 a Conservative rising, under Rafael Carrera, president of Guatemala, resulted in the overthrow of the Liberals, under General Francisco Morazan of Honduras; and in 1842, after a vain attempt to restore the Federal republic, Morazan was captured and shot. A fresh union of the republics (except Costa Rica) was concluded in 1842, and dissolved in 1845. The year 1850 was signalized by the conclusion, on the 19th of April, of the Clayton-Bulwer treaty (p.87) between Great Britain and the United States, which designed to facilitate the construction of an interoceanic canal. The restoration of this project is given in detail under Panama Canal. One important result of the treaty was the abandonment, in 1850, of the British protectorate over the Mosquito Coast. This event had been preceded by a decade of political disturbances. In 1850 Honduras, Salvador and Nicaragua had combined to restore federal unity; but their allied armies were defeated by the Guatemalans under Carrera. In 1856 the American adventurer, William Walker, endeavoured to usurp the government of Nicaragua; in 1850 he invaded Honduras and was captured and shot. His object was to assist the slave-holders of the United States by adding new slave-states to the Union. A further attempt to restore federal unity failed in 1855, and its promoter, Justo Rufino Barrios, president of Guatemala, lost his life. In 1855 the Greater Republic of Central America was formed by the union of Nicaragua, Salvador and Honduras; and a constitution was framed providing for the admission of Guatemala and Costa Rica; in December 1856 it was dissolved, as unsatisfactory to Salvador. On the 4th of November 1903 Panama, which had since 1853 formed part of Colombia, declared itself an autonomous republic. Its independence was immediately recognized by the United States, and soon afterwards by all the European powers. The United States also forwarded the landing of any Colombian force on the territories of Panama, and thus guaranteed the security of the new state.

ARCHAEOLOGY OF CENTRAL AMERICA

Discoveries and investigations carried on during the 19th century have thrown much light on the splendid past of Central America. The still extant ruins of great buildings, unlike anything which is known in the old world, testify to the high culture attained in pre-Columbian days by several native peoples differing greatly from one another in speech and racial affinities. As a science the archaeology of Central America has scarcely yet emerged from its infancy. Entire branches are still wholly uninvestigated. Amongst the numerous problems which await solution must still be reckoned the decipherment of the inscriptions, which hitherto has not progressed beyond the discovery of calendar systems and the relative datings involved in such systems.

For a complete survey of this ancient civilization, so far as it has been investigated, it is necessary to include with Central America, properly so called, a considerable portion of the Mexican territories south and east of the isthmus of Tehuantepec. The peoples inhabiting Yucatan, Campeche, Guatemala, Chiapas and Oaxaca present at the first view striking ethnical differences. On a linguistic basis, however, they may be divided into several large groups. Thus, Yucatan and the greater part of Guatemala are inhabited by the Mayas, with whom may be included the still savage Lacantun or Lacandones. Related to these linguistically are the Zapotecs and Mixtecs of Mexico, and the Quiches and Caucchkewees in Guatemala, as well as the less important tribes of the Mam, Pokoman, Poncheki, Tzotzil, Tzutuhil and Ixil. Between these there are patches of country in which dialects of the Mexican are spoken. In Oaxaca there is an extraordinary mixture of languages, some of which, like that of the Huave of Tehuantepec, are of quite unknown affinities; the bulk of the population, however, is composed of Mixtecs and Zapotecs with which the Mixe and Zoque on the east are connected. Mexican dialects also occur in isolated parts of Oaxaca.

Mayan Culture.—The civilization of the Mayas may well have been reared upon one more ancient, but the life of that culture of which the ruins are now visible certainly lasted no more than 900 years. The date of its extinction is unknown, but in certain places, notably Mayapan and Chicenitza, the highest development seems to be synchronous with the appearance of foreign, viz. Mexican or Nahua elements (see below). This quite distinct local character suggests that the cities in question had a certain preponderating role, a hypothesis which, with the scanty documentary evidence is in agreement. On the other hand the Mayan culture evinces an evident tendency to assimilate heterogeneous elements, obliterating racial distinctions and imposing its own dominant character over a wide area. Oaxaca, the country of the Mixtecs and Zapotecs, became, as was natural from its geographical position midway between Yucatan and Mexico, the meeting-ground where two archaeological traditions which are sharply contrasted in their original homes united.

Central American architecture is characterized by a fine feeling for construction, and the execution is at once bold and architecturally effective. Amongst the various ruins, some of which represent the remains of entire cities, while others are no more than groups of buildings or single buildings, certain types persistently recur. The commonest of such types are pyramids and galleries. The pyramids are occasionally built of brick, but most usually of hewn stone with a covering of finely-carved slabs. Staircases lead up to the top from one or more sides. Some pyramids are built in steps. Usually the platform on the top of a pyramid is occupied by buildings, the typical distribution of which is into two parts, viz. vestibule and sanctuary. In connexion with the pyramid there are various subsidiary structures, such as altars, pillars, and sacrificial stones, to meet the requirements of ritual and worship, besides habitations for officials and “tennis-courts” for the famous ball-game like that played by the Mexicans. The tennis-courts always run north and south, and all the buildings, almost without exception, have a definite orientation to particular points of the compass. Frequently the pyramids

ARCHITECTURE.
Central America

constitute one of the four sides of a quadrangular enclosure, within which are contained other pyramids, altars or other buildings of various dimensions.

The normal type of gallery is an oblong building, of which the front facing inwards to the enclosure is pierced by doors. These divide it into a series of rooms, behind which again there may be a second series. Occasionally the rooms are distributed round a central apartment, but this is ordinarily done only when a second storey has to be placed above them. The gallery-buildings may rise to as much as three storeys, the height, size and shape of the rooms being determined by the exigencies of vaulting. The principle of the true arch is unknown, so that the vaults are often of the corbelled kind, the slabs of the side-walls being made to overlap in succession until there remains only so narrow a space as may be spanned by a single flat stone.

At Mitla, where the material used in the construction of the buildings was timber instead of stone, the larger rooms were furnished with stone pillars on which the beams could rest. The same principle recurs in certain ruins at Chichenitza. The tops and sides of the doors are often decorated with carved reliefs and hieroglyphs, and the entrances are sometimes supported by plain or carved column-like pillars, of which the serpent columns of Chichenitza afford the most striking example. On its external front one of these galleries may have a cornice and half-pillars. Above this is a plain surface of wall, then a rich frieze which generally exhibits the most elaborate ornamentation in the whole building. The subjects are geometrical designs in mosaic, serpents' heads and human masks. The corners of the wall terminate in three-quarter pillars, above which the angles of the frieze frequently show grotesque heads with noses exaggerated into trunks. The roof of the gallery is flat and occasionally gabled.

Principal Sites.—Such are the general characteristics of Central American buildings, but it must be understood that almost every site exhibits peculiarities of its own, and the number of the ruined settlements even as at present known is very large. The most considerable are enumerated below.

Yucatan.—Of the very numerous ruins which are distributed over Yucatan and the islands of the east coast the majority still await exploration. A few words of special notice may be devoted to the most prominent ruins, of which the principal have already become famous. At Uxmal the buildings consist of three considerable groups, viz.—the Casa de la Divina, which is a step-pyramid 240 ft. long by 160 ft. wide and 80 ft. high, crowned by a temple 75 ft. long by 12 ft. wide; the Casa de Monjas, a striking erection of four oblong buildings on an extensive terrace; the Casa de Tortugas, Casa del Gobernador, and Casa de Palomas, the last of which is a group of six galleries surrounding a court. At Izamal there is a very imposing group of ruins, as yet quite insufficiently explored. At Chichenitza, a city of first-rate importance, situated 22 m. west of Valladolid, the ruins consist of eight principal groups, the chief of which are as follows. The Casa de Monjas, a three-storeyed building, attributable to several distinct periods; the Caracol, a round structure with dome in imitation of a small-shell, showing evident traces of Mexican influence; El Castillo, a large temple standing on a base 200 ft. long and 75 ft. high, approached by staircases on all four sides, and furnished with serpent-pillars of a kind unknown anywhere else except at Uxmal and Tula near Mexico; an unnamed temple-pyramid, which is remarkable for a group of caryatid figures; a tennis-court; and finally the Tiger Temple, which contains marvellous coloured reliefs representing figures of warriors and place-hieroglyphs, all executed in a distinctively Mexican style. Yet another evidence of Mexican influence at Chichenitza is to be noted in five figures of the so-called Chac-mol type, that is to say, horizontal figures in which the arms are extended to the navel which is indicated by a cup-like depression. This Chac-mol type is characteristic of such sites as Tlascala and Cempoalan.

Other important sites in Yucatan are Chacmaltepec, with fine wall-paintings; Tantah, with remarkable pillared façades; the ruins of Labna, Chunuhub, and the caves of Loltun; and Xlapak de Santa Rosa, where there is a three-storeyed temple palace. Two sculptured reliefs are of great interest; they represent a person holding a staff on which is a figure of the god Ah-bolon-itzcab.

Guatemala.—The Guatemalan ruins are distributed over a wide area. The most numerous and extensive are on the Usamancita river. The most important sites in that district are Piedras Negras, and Yaxchilan or Menche Tshipanit, where there are temples covered with sculptured reliefs and hieroglyphic inscriptions, and stelae and slabs carved with human figures placed in niches. In the Peten district, Tikal is famous for its splendid sculptures representing Kukulkan and other divinities. Near the modern city of Guatemala are the vast ruins of Guatemala-Mixco. Chacuul, which Cortés visited on his expedition of 1524—1525 is very possibly to be identified with the modern Pueblo Viejo on the river Tinaja. Chaculul and Quen-Santo between the headwaters of the Rio de Chiapas and the Rio Lacantun are two sites of a strongly marked local character. Series of three pyramids are peculiar to these two settlements, as also are pyramids with human figures on their platforms. Stelae discovered at Quen Santo have a calendar character, which proves that Mayan science had penetrated into what was probably a Noth of the old Lacalan culture.

Santa Lucia Cosamulhuapa, on the Pacific slope of the Cordilleras, is a very peculiar site. The ruins are those of a settlement which had already been deserted before Alvarado's expedition of 1522. The sculptures of gods, goddesses and other figures, executed on enormous blocks of stone, show a distinctively Mexican character, with which, however, various Mayan features are blended. They may perhaps be attributed to some offshoot of the Nahua stock, probably the Pipil Indians, which developed on lines of its own in this remote corner.

Near the frontier of Honduras are the remarkable ruins of Quirigua, which rival Copan in importance and have suffered less from the ravages of the climate. The ruins of temples and palaces contain gigantic stone stelae of very fine workmanship, on which are sculptured human and animal figures representing hieroglyphs of the calendar dates.

Honduras.—Copan, one of the most important seats of Mayan civilization, lies close to the borders of Guatemala. The ruins comprise great buildings, temples, pyramids, &c. and contain sculptured reliefs of the highest interest. Especially noteworthy are altars in the form of a turtle and stelae covered with hieroglyphs. The hieroglyphs are of the kind usually found in such ruins, the meaning of which is so far clear that it is known that the commencement of an inscription records certain dates in the complicated calendar system of the Mayas. A collection of these dates demonstrates that the most ancient on record are separated from the most recent by an interval of only a few centuries. From this it may be concluded that the Mayan civilization, whether or not it was preceded by anything older, flourished for only a comparatively short period, the beginning of which cannot be placed many centuries before A.D. 1000.

According to Squier (Honduras, London, 1870, p. 75) the other principal ruins of Honduras are to be found in plains of the department of Comayagua, near Yarumela, near Lajamini, and in the ruined town of Cururu. They are “large, pyramidal, terraced structures, often faced with stones, conical mounds of earth and walls of stone.” Further ruins, such as those of Cala-mulli, Jama-taca, Maniana, Guasigatunga, Chapulca and Chapultapec, are found in the departments of Comayagua in the side valleys and adjoining table-lands. The most interesting and most extensive are the ruins of Tenampa (Pueblo Viejo), about 20 m. south-east of Comayagua. Here ramparts, defence works, terraced stone mounds and numerous large pyramids are to be found. Squier found further ruins in the west of Honduras, which have also been described in part by Stephens, and were probably first mentioned in 1576 by Diego Garcia de Palacio (Carta dirigida al Rei de Espana, published by Squier, New York, 1866).

At Rio Ulloa are remains which testify to the existence of a large population in past days. Possibly they may be identified

with a site of the name of Naco mentioned by Las Casas and by Bernal Diaz (Histoire véritable de la conquête de la Nouvelle Espagne, translated by D. Fourdanet, 2nd ed., Paris, 1877, ch. 178, p. 690).

Chiapas (Mexico).—The principal site is Palenque, the ruins of which were amongst the earliest of all to attract attention. The style of architecture, with the gigantic vaults and singular comb-shaped gables, distinguishes Palenque from Copan and Quirigua, which it surpasses also in the unequalled magnificence of its sculptures. Five out of the remarkably uniform series of buildings may be specially mentioned. They are the Great Palace, a complex structure of galleries and courts commanded by a three-storied tower, the Temples of the Cross, which are galleries constructed on terraces and containing the well-known reliefs, the Temple of Inscriptions, the Sun Temple and the Temple of the Relief. The sculptured figures of Palenque are familiar from many reproductions. The most characteristic groups represent a deity standing between worshippers who hold a staff surmounted by the water-god Ah-bolon-tzabac, the “god of the nine medicines.” The inscriptions on the famous Cross Temple contain calendar-datings which are remarkable as showing a particular combination of numbers and hieroglyphs, which does not occur elsewhere.

A whole series of sites is included within the geographical limits of Chiapas, which from the archaeologist’s standpoint must be considered as belonging properly to Guatemala. The country has been quite insufficiently explored.

Oaxaca (Mexico).—The bulk of the population of the province of Oaxaca is composed of a distinct racial group, best represented by the Zapotecs, who have been for an unknown length of time the intermediaries between the Nahuat civilization of Mexico on the west and the Mayan on the east. The influence of the two separate currents may be detected in the bastard calendar system no less than in the still undeciphered inscriptions. The principal ruins are those of Mitla, the burial city of the priests and kings of the ancient Zapotecs, which bear a quite distinct character, though presenting certain analogies with the Mexican. One of the chief structures is a step-pyramid, rising in three steps to a height of 130 ft., another is a pyramid of brick. Besides these there are courts, surrounded by palaces which represented necropolises, the dwellings of the priests, of the chief priest, and of the king (with an audience-hall). The wall paintings of the “palaces” are especially admirable, and it is to be noted that the deities represented in them are those of the Mexican pantheon.

Monte Alban is interesting for the definitely Zapotec character of its sculptures. Quiengola near Tehuantepec is a site with extensive ruins including a fine tennis court.

British Honduras.—The antiquities of British Honduras have been but little investigated. In the scanty literature relating to them a few accounts of ruined places are to be found. In style these buildings closely resemble those of the neighbouring Yucatan. The ruins in the colony New Boston, mentioned by Froebel (Central America, p. 167), are of this kind. F. de P. Castells (see American Antiquarian, Chicago, 1904, vol. xxv. pp. 32-37) describes the ruins, in the north of the colony, of “Ixim chech,” supposed to be the Indian form of the English name New Boston. They are on the road to the Lake of Yaxha (green water), where further ruins are to be found. Thomas Gann gives detailed accounts of numerous mounds also in the northern part of British Honduras (see 14th Annual Report of the Bureau of American Ethnology, Washington, 1900, part i. pp. 661-662, with plates). The most interesting ruins are those which have been discovered in Santa Rita, at the mouth of the New River, near the town of Corosal. Here wonderful wall paintings in stucco came to light, which unfortunately Gann could only save in part. The remainder were destroyed by Indians. It should be remarked that a number of the mounds in Santa Rita were erected over ruins of buildings which must therefore be of older date than the mounds.

Salvador.—Pedro de Alvarado in his expedition of 1534 calls this whole district Cuscatlan (Mos. Cuscatal). It is, “Land of precious stones; of treasures; of abundance.” A further description of the land is given by Palacio (i.e.) in 1576. Although there are numerous relics of Mayan civilization buried in the earth, few ruins are to be seen on the surface. Karl Sapper has described three large ruins: Cuzcatlan near the capital, Tehuacan near S. Vicente, and Zacualpa on the lake of Gijia in the extreme north-west of the country. The ruins show a distinct affinity in style to those of the Mayan buildings in Guatemala, but they are less fine and artistically perfect. Probably the central and western districts of San Salvador were originally peopled by the same race of Mayas, and these tracts of country were later settled by the Mexican-speaking Pipiles.

A characteristic feature of the extensive ruins of Zacualpa is that the pyramids and ramparts have perpendicular steps which are higher than they are broad, and this peculiarity may be attributed to the influence of the Maya tribes, who are related to the Mams of Guatemala.

Decipherment of the Mayan Hieroglyphs.—The key to the decipherment, so far as this has progressed at present, was furnished by the Historia de los Casas de Yucatan, a work written by Diego de Landa, the first bishop of the country. This process, however, give, with much other more or less doubtful information, the full account of a calendar system analogous to that of the Mexicans, which was said to have been used by the Mayas (see Mexico). The signs for each of the 20 days and for the 18 weeks of 20 days are figured by Landa. The first step was to compare these with the hieroglyphic characters contained in the few Mayan picture manuscripts (Codex Troano, Cortesianus, Peresianus, Dresden Codex) which have survived the destructive fanaticism of the Spanish missionaries. Förstemann’s acute analysis detected that the bars and dots which occur along the margin and in the body of the pictorial scenes represented numerals, dots standing for each integer up to five, while for five a bar was used. Next, it was found that the order in which these numeral-signs are placed is regular, and that there are never more than five in a group. It was established that the first sign in such a group is that for the numeral 1 (Kin), the next that for 20 (Uinal), the third for 18×20 (Tun), the fourth for 18×20×20 (Katun), and the fifth for 18×20×20×20, that is to say, a Calendar.

Had the available material for study been confined to the manuscripts, little more progress would have been made beyond establishing subsidiary details in the actual calendar. But when a similar analysis was applied to the numerous monuments discovered and figured by Maudslay and others, some important results of a general bearing were obtained. It was found that many of the hieroglyphs of various forms upon the stones were also of numeral value, and what was of great importance, that they all referred back to a single starting-point. This starting-point or zero is no doubt the mythological date at which, according to Mayan cosmology, the world was created. It is placed at nine or ten cycles before the time when Copan and Quirigua were erected and the picture manuscripts made. And it is by reference to it in the inscriptions that such students as Seler, Goodman and others have been enabled, as already stated, to obtain a record of the relative chronology of the most famous monuments, to confine the period of their erection within the space of a few (the most common) or the very long period of a hundred years.

Though much yet remains to be done, these are substantial results which have already been won from the study of the hieroglyphs.

BIBLIOGRAPHY.—The Antiquités mexicaines of Du Paix (Paris, 1834); the Voyage pittoresque et archéologique dans la province de Yucatan (Paris, 1847); and the Monuments antiques du Mexique de Bourbourg and Waldeck (Paris, 1866) are quite out of date and superseded. Stephen’s Incidents of Travel in Central America, Chiapas and Yucatan (New York, 1841 and 1842) and M. Norman’s Ruines de Yucatan (New York, 1843), are still of value, the first mentioned especially for the drawings by Catherwood. Among the earlier writers may also be mentioned Charnay, Les Anciennes Villes du Nouveau Monde (Paris, 1883) and Cités et ruines américaines (Paris, 1863), the latter written in collaboration with Viollet-le-Duc. Those, however, who are not primarily bibliophiles will be content to study the following:—Maudslay (in Godman and Salvijn’s Biologia Centrali-Americana, sect. Archaeology, ...
London, 1889, &c.), a pioneer work containing the admirably presented results of scientific exploration. Maler, in Memoirs of the Peabody Museum, vol. ii. 1, 2 (Cambridge, U.S.A., 1901 and 1903); Holmes, Archaeological Studies among the Ancient Mexicans (Field Columbian Museum, Chicago, 1897), Die Kuppeltaler (Berlin, 1891), Wesenmalereien von Milla (Berlin, 1895), Ges. Abhandlungen, vol. i. (Berlin, 1902) and vol. ii. (1904), Führer von Milla (Berlin, 1906). E. Förstmann has contributed many valuable essays to Geologische Forschungen (Bonn); especially are his commentaries to the Dresden Codex (Dresden, 1901), to the Codex Tro-Cortesianus Madri delensis (Danzig, 1902), and to the Codex Peresianus (Danzig, 1903). See also The Archea Maya Institute, Contributions to Pre-Columbian, section Archaeology, viii., 1897, and Report of an Archaeological Tour in Mexico in 1881, by A. F. Bandelier (Boston, 1884). Valuable bibliographies have been made by Bandelier (Notes on the Ethnology of the Big Bend and Central Border of Mexico, 1885 and 1886, and by K. Häberl ("Die Maya Literatur and der Maya Apparat zu Dresden," in the Zeitschrift für Bibliotheke, xii., 1895). The Mayan picture MSS. have been published in facsimile as follows:—the Dresden Codex by Förstmann (Leipzig, 1894, and Dresden, 1892), and the Codex Tro by Brasseur de Bourbourg:—Manuscrit Troano, étude sur le système graphique et la langue des Mayas (Paris, 1895-790), the Codex Cortesianus by Léon de Rosny (Paris, 1885) and by F. de Dios de la Rada y Delgado and F. L. de Ayala del Hoyo (Madrid, 1893), the Codex Peresianus by Duruy and Brasseur de Bourbourg (Paris, 1864) and by L. de Rosny (Paris, 1887). The following relate especially to the ruins in Salvador:—La Universidad, by L. Gonzalez, vol. iii. of Mexico (Mexico City, 1863); Le Canada espagnol et le peuple français, by G. de Montcaux de Ballore (Paris, 1891), 25 plates; Karl Sapper in Arch. für Ethnologie, 9. p. 3. (1896). W. L.

CENTRAL FALLS, a city of Providence county, Rhode Island, U.S.A., on the Blackstone river, about 5 m. N. of Providence. Pop. (1900) 18,107; (1905, state census) 19,446, of whom 8792 were foreign-born, 4164 being French-Canadian, 1587 being English, and 1929 being Irish; (1910) 22,374. It is served by the New York, New Haven & Hartford railway. The Blackstone furnishes good water-power, and the city is the manufacturing centre of the district, and manufactures leather goods; other important industries are the refining of copper and the manufacture of woollens, silks and hair-cloth. The total value of the factory product in 1905 was $5,090,984, being 12-0% more than in 1900. A settlement was established here about 1763 and was first a part of Smithfield, and then, after 1871, of Lincoln. About 1790 a chocolate mill was erected, and from then until 1827 the settlement was known as Chocolatville. It was incorporated as the Central Falls Fire District of Smithfield in 1847, and in 1895 was chartered as a city.

CENTRALIA, a city of Marion county, Illinois, U.S.A., in the S. part of the state, about 62 m. E. of St Louis. Pop. (1890) 4765; (1900) 6721 (571 foreign-born); (1910) 9680. The city is served by the Chicago, Burlington & Quincy, the Illinois Central, the Illinois Southern, and the Southern railways; the two first have repair shops here. Centralia is situated in the central part of south-central Illinois, popularly known as "Egypt." Among its manufactures are window glass, envelopes, quills, concrete blocks and flour. In and near the city coal is mined, and apples, strawberries and other fruits are raised, and the city is a shipping point for coal and fruit. Centralia was first settled in 1853, and was first chartered as a city in 1859.

CENTRAL INDIA, a collection of native states in India forming a separate agency, which must not be confounded with the Central Provinces. The Central India agency was formed in 1854, when Sir R. Hamilton was appointed agent to the governor-general. It lies between 21° 24' and 62° 35' N. and between 74° 0' and 85° 0' E., and may be said to consist of two large detached tracts of country which, with Jhansi as a pivot, spread outwards east and west into the peninsula, reaching northward to within some 30 m. of Agra, and southward into the valley of the Nerbudda and the Vindhya and Satpura ranges. The total area is 75,772 sq. m., It is bounded on the N. and N. E. by the United Provinces, on the W. and S.W. by Rajputana, some native states of the Bombay presidency, and Khandesh. The Central Provinces and the Bengal district of Chota Nagpur encircle it on the S. and E., while the Jhansi district of the United Provinces separates the two tracts.

Central India may be divided into three great natural divisions: the highlands of the Malwa plateau, with a mean elevation of some 1500 ft. above sea-level; the low-lying country some 600 ft. above sea-level, comprising the greater part of the eastern section of the agency; and the hilly tracts, which lie mostly to the south. The Malwa plateau consists of great undulating plains, separated by flat-topped hills, whose sides are boldly terraced, with here and there a scarp rising above the general level; it is covered with long grass, stunted trees and scrub, which, owing to the presence of deciduous plants is of a uniform straw colour, except in the rains. The foundation of this plateau is a bed of sandstone and shales belonging to the Vindhyan series. This bed, which stretches east and west from Sasseram to Deorah, and north and south from Agra to Hoshangabad, comprises the whole of the agency except the northern part of Bundelkhand. On the plateau itself the sandstone is generally overlaid by the Deccan trap, a blackish-coloured basaltic rock of volcanic origin, the high tableland having been formed by a succession of lava flows, the valleys of Central India being merely channels carved out by the action of rivers. It is apparently the northern limit of what was once a vast basaltic plain stretching from Goona to Belgum, “one of the most gigantic outpourings of volcanic matter in the world.” The sandstone bed on which it rests is visible at a point just north of Goona, and in a small area round Bhilsa and Bhopal, as it is in those places freed from the layer of trap. The low-lying land includes roughly that part of the agency which lies to the east of the plateau and comprises the greater part of the political divisions of Bundelkhand and Baghelkhand and the country round Gwalior. The formation save in north Bundelkhand is sandstone of the Vindhyan series, free as a rule from “trap.” In the north of Bundelkhand the prevailing rock is gneiss and quartz. The quartz takes the shape of long serrated ridges, which are in many places a characteristic feature of the landscape. Trap appears here and there in intrusive dykes. The hilly tracts lie chiefly to the south of the agency, where the Vindhyas, Satpura and Kaimur ranges are met with. The country is rough forest and jungle land little used for cultivation. The greater part of Central India is covered with the well-known “black cotton soil,” produced by the disintegration of the trap rock. It is a very rich loamy earth, possessing great fertility and an unusual power of retaining moisture, which makes artificial irrigation little needed. Opium and millet are the principal crops grown upon it. The ordinary “red soil” covers a large part of northern Bundelkhand, and as it requires much irrigation, tanks are a special feature in this country. Ethnologically as well as climatically the differences between the plateau and the eastern part of the agency are distinct and the languages markedly so. The plateau is inhabited by pure-blooded Rajput races, whose ancestry can be traced back for centuries, with all their numerous offshoots. The inhabitants of the low-lying country are also Janjatis, and the Rajputs and Janjatis are nearly alike in type. The castes of the hilly plateau will have no marriage connexion with them. The races of the hilly tracts are semi-civilized tribes, who often flee at the mere sight of a white man, and have as yet been but little affected by the Hindu religion of their Rajput rulers. Of the climate of the plateau, Abul Fazi, the author of the Ain-i-Akbari, says: “The climate is so temperate that in the winter there is no occasion for warm clothing; nor is it necessary in summer to cool the water with salt water. But in the four rainy months the night air is cold enough to render a quilt necessary.” The rains of the south-west monsoon reach Central India as a rule about the 12th of July, and last until the end of September. Administrative Divisions.—The Central India agency is divided for administrative purposes into nine units, two classes as residencies and six as agencies. These are the residences of Gwalior and Indore, and the agencies of Baghelkhand, Bhopal, Chhatarpur, Gwalior, Indore, and Malwa. But these divisions are purely an artificial grouping for the purposes of the British government, the original native divisions consisting of 16 states and 98 minor states and estates. The 15 large states are Gwalior, Indore, Rewa, Bhopal, Bhar, Barwani, Datia, Orcha, Charkhari, Chhatarpur, Panna, Dewas, (senior branch), Dewas (junior branch), Jaora and Ratlam. At the close of the
Pindari War in 1818 the whole country that is now under the Central India agency was in great confusion and disorder, having suffered from the exactions of the Maharrata armies and from predatory bands. It had been the policy of the great Maharrata chiefs, Holkar and Sindia, to trample down into complete subjection all the petty Rajput princes, whose lands they seized and from whom they levied heavy contributions of money. Many of these minor chiefs had been expelled from their possessions, had taken refuge in the hills and forest, and retaliated upon the Maharrata usurpers by wasting the lands which they had lost, until the Maharratas compounded for peace by payment of blackmail. In this state of affairs all parties agreed to accept the interposition of the British government for the restoration of order, and under Lord Hastings the work of pacification was effected. The policy pursued was to declare the permanency of the rights existing at the time of the British interposition, conditionally upon the maintenance of order; to adjust and guarantee the relations of subordinate and tributary chiefs to their superiors so as to prevent all further disputes or encroachments, and to settle the claims of the ousted landholders, who had resorted to pillage or blackmail, by fixing grants of land to be made to them, or settling the money allowances to be paid to them. The general result was to place all the privileges, rights and possessions of these inferior chiefs under the guarantee or protection of the British government, to whom all disputes between the superior and inferior states must be referred, and whose decision is final upon all questions of succession to hereditary rights or rulership. The states have no general ethnological affinity, such as exists in Rajputana. Their territories are in many cases neither compact nor continuous, consisting of a number of villages here and there, with a nucleus of more or less importance round the chief town. Their relations to the government of India and to each other present many variations. Ten of them are under direct treaty with the government of India; others are held under sanads and deeds of fealty and obedience; while a third class, known as the mediatised states, are held under agreements mediated by the British government between them and their superior chiefs.

Population.—The total population of the Central India agency in 1901 was 8,628,781, showing a decrease during the decade of 10.4%. Considerable losses were caused by the famines of 1897-1898 and 1899-1900, which were severely felt, especially in Bhopal and Malwa. The greater part of the population of Central India is of the Hindu religion, but a few Mahomedan groups still exist, either traces of the days when the Mogul emperors extended their sway from the Punjab to the Deccan, or else the descendants of those northern adventurers who tired out their services to the great Maharrata generals. Of the first Bhopal is the only example, while Jaora is the only notable instance of the other. Roughly there are four great sections of the population: the Maharrata section, who belong to the ruling circle; the Rajputs, who are also hereditary nobility, the trading classes, consisting mainly of Marwaris and Gujaratis; and the four jungle tribes of Dravidian stock. The Marwaris are foreigners, and, though rulers of the greater part of Central India, have no true connexion with the soil and are little met with outside cities, the vicinity of courts, and administrative centres. The Rajputs with all their endless ramifications form a large portion of the population. Originally invaders, they have so long held a stake in the soil that they have become almost part of the indigenous population. The Marwaris hold practically all the trade of Central India, with the exception of the Bora class of Mahomedans. They are either Vaishnavite Hindus or else Jains. Their advent into Central India dates, except in the case of one or two families, from the time of the Maharrata invasion only. The Jain portion of this community is very wealthy. The last section, that of the jungle tribes, is mostly of Dravidian or mixed Aryo-Dravidian origin, these tribes being the modern representatives of the former rulers and inhabitants of this country.

The British agent to the governor-general resides at Indore, and there are British cantonments at Mhow, Neemuch and Nowgong. The whole country is fairly provided with railroads, largely at the expense of Sindia.

Central Provinces and Berar, a province of British India, which was formed in October 1903 by the amalgamation of the Central Provinces and the Hyderabad Assigned Districts. The total area of the provinces is 113,281 sq. m., and the population on that area in 1901 was 10,847,325. As is shown by its name the province is situated in the centre of the Indian peninsula, comprising a large proportion of the broad belt of hill and plateau country which separates the plains of Hindustan from the Deccan. It is bounded on the N. and E. by the Central India states, and along a small strip of the Saugar district by the United Provinces; on the W. by Bhopal, Indore and the Khandesh district of Bombay; on the S. by Hyderabad and the large zamindari estates of the Madras presidency; and on the E. by these latter estates and the tributary states of Bengal. In October 1905 most of Sambalpur and five Oryia-speaking hill-states were transferred from the Central Provinces to Bengal, while the Marwarified states of Chota Nagpur were transferred from Bengal to the Central Provinces. The province, therefore, now consists of five of the British divisions of Jubbulpore, Berar, Nagpur, Chhattisgarh and Berar, which are divided into the twenty-two districts of Saugar, Damoh, Jubbulpore, Mandla, Sonei, Narsinghpur, Hoshangabad, Nemar, Betul, Chhindwara, Wardha, Nagpur, Chanda, Bhandara, Balaghat, Raipur, Bilaspur, Amraoti, Akola, Ellichpur, Buldana and Wun; and the fifteen tributary states of Mahratta, Bastar, Kanker, Nagdanda, Kairaghar, Chhukkanadhan, Kawardha, Sakti, Raigarh, Sarangh, Chong Bhakar, Korea, Siriguja, Udaipur and Jashpur.

The Central Provinces are divided into two parts by the Satpura range of hills (q.v.), which runs south of the Nerbudda river from 1120 to 1400 ft. highest, and generally, it consists of a series of districts north of the Satpuras, districts on the Satpura plateau, and districts south of the Satpuras. North of the Satpuras is the rich valley of the Nerbudda, which may be said to be the producing and distributing centre of the whole larger range, and which is highly cultivated. South of the Satpuras lies the great plain of Chhattisgarh at a mean elevation above the sea of 1000 ft.; it has an area of 23,000 sq. m., and forms the upper basin of the Mahanadi and the Kanker, which join latter the river, which discharges the great plain of Nagpur, extending over 24,000 sq. m. Its general surface inclines towards the south from 1000 ft. above the sea at Nagpur to 750 ft. at Chanda. To the south of the province is shut in by the wide mountain range, through which flows Nagpur and in the clear month of May, the walls which calm it in the north, Berar is divided into two sections, the Payanghat or lowland country, bounded on the north by the Gaviaghil hills, and on the south by the outer escarp of the Ajanta range, and the Bunghor or hilly country, sloping down southwards beyond the ghat or passes which lead up to it. The Payanghat is a wide valley running up eastward between this ridge and the Gaviaghil hills, varying in breadth from 10 to 30 m., and broad as it reaches its confluence with the Nerbudda it contains all the best land in Berar; it is full of deep, rich, black alluvial soil, of almost inexhaustible fertility, and it supplies sufficiently to maintain a natural system of drainage, but there is nothing picturesque about this broad strip of champagne. The hilly tract, on the contrary, is diversified with low-lying
plains, high plateaus, fertile bottoms and rocky wastes, and is rendered picturesque by rivers and groves.

**Natural Features.**—The provinces may be divided into two tracts of upland and three plains, consisting of the Vindhyas and Satpura ranges. The Vindhyas extend northwards, along the eastern boundary of the Vindhyian escarpment. In this region the sandstone rocks are generally overlaid with heavy black soil formed from the decay of the subsoil and notable for the cultivation of the grain and wheat, and in its hillier districts are interspersed in the lighter and more sandy soils. Next, the long and narrow valley of the Vindhyas, from Jubbulpore to Hoshangabad is formed of deep alluvial flats consisting of extreme richness and excellently suited to the growth of wheat. To the south of the Vindhyas, the Satpura range stretches across the province, containing the greater part of five districts, its crystalline and sandstone rocks rising in places through the superficial stratum of sand, and with large areas of shallow sandy lands. The section of the Satpura range in the northern districts, in the black-soil valleys of great fertility. In the latter are grown wheat and other spring crops, while the lighter kinds of rice and the hill millets are all that the poorer land can bear. To the south of the Satpura range, and in its basaltic plateau, lies the Province of the Berar, Nagpur and Chhattisgarh plains. The surface soil of Berar is to a great extent a rich black vegetable mould; and where this surface soil does not exist, there is a marly soil on a shallow upturned subsoil of the former black soil. The surface soil of the Vindhyas and Waingangar rivers, contains towards the west the shallow black soil in which autumn crops like cotton and the large millet, Jowar, which do not require excessive moisture, can be successfully grown. The clayey soils of the adjacent regions, and the Chhattisgarh plain, comprising the Mahanadi basin, form the great rice tract of the province, its heavy rainfall and hard yellowish soil rendering it excellently adapted for the growth of this crop.

**Trade.**—The trade of the Central Provinces and Berar comprises as a whole divided into hot and cool ones. In the latter division are comprised the two Vindhyan districts of Satpura and Nagpur, and Jubbulpore, at the head of the Nerbudda valley, and the four Satpura ranges of Gwalior, Ujjain, Berar and Nagpur. The former is divided into the two large districts of the Central Provinces, and the latter into three smaller districts; the former having a large and active trade, the latter are of a smaller extent.

**Population.**—The population of the Central Provinces and Berar has increased greatly since 1891, when the census was taken for the first time. In that year the population of the province was stated to be 10,807,035, and in 1901 it had increased to 11,603,990. Of the latter number, 1,495,000 are classified as Anglo-Indians. The province is divided into seven districts, viz., Nagpur, Warora, Kotwar, Bhandara, Chanda, Raipur, and Satpura.

In conclusion, the Central Provinces and Berar are a region of considerable agricultural importance, with a diverse range of crops and climate, providing a rich tapestry of natural and commercial features. The province's history is marked by significant periods of settlement and administration, influencing its modern-day geography and economy.
dynasties from the 14th to the 16th centuries. The first of these is mentioned in 1398, when Narsingh Rai, raja of Kheda, is said by the chroniclers to have ruled all the hills of Gondwana. He was finally overthrown and killed by Hoshang Shah, king of Malwa. The 16th century saw the establishment of a powerful Gond kingdom by Sangram Sah, who succeeded in 1480 as the 47th of the petty Gond rajas of Garha-Mandla, and extended his dominions so as to include Saugor and Damoh on the Vindhyan plateau, Jubbulpore and Narsinghpur in the Nerubudda valley, and Seoni on the Satpura highlands. Sangram Sah died in 1536; and the break up of his dominion began with the enforced cession to the Mogul emperor by Chandra Sah (1563–1575) of Saugor and Damoh and of that portion of his territories which afterwards formed the state of Bhopal. About 200 years after Sangram Sah’s time, Bakht Buland, the Gond chiefman of a principality seated at Deogarh in Chhindwara, having visited Delhi, set about introducing the civilization he had there admired. He founded the city of Nagpur, which his successor made his capital. The Deogarh kingdom, at its widest extent, embraced the modern districts of Betul, Chhindwara, Nagpur, with parts of Seoni, Bhandara and Balaghat. In the 16th century his successor, Raja Manohar, was the seat of another Gond dynasty, which first came into prominence in the 16th century. The three Gond principalities of Garha-Mandla, Deogarh and Chanda were nominally subject to the Mogul emperors. In addition to the acquisitions made in the north at the expense of Garha-Mandla, the Moguls, after the annexation of Berar, established governors at Paunari in Wardha and Kherla in Betul. Having thus hemmed in the Gond states, however, they made no efforts to assert any effective sovereignty over them; the Gond rajas for their part were content with practical independence within their own dominions. Under their peaceful rule their territories flourished, until the weakening of the Mogul empire and the rise of the predatory Bundela and Mahraott power, with the organized forces of which their semi-barbarous feudal levies were unable to cope, brought misfortune upon them.

In the 17th century Chhatrasal, the Bundela chiefman, deprived the Mandla principality of part of the Vindhyan plateau and the Nerubudda valley. In 1733 the peshwa of Poona invaded Bundelkhand; and in 1735 the Mahrrattas had established their power in Saugor. In 1742 the peshwa advanced to Mandla and exacted the payment of chaouth (tributary blackmail), and from this time until 1781, when the successors of Sangram Sah were finally overthrown, Garha-Mandla remained practically a Mahrratta dependency. Meanwhile the other independent principalities of Gondwana had in turn succumbed. In 1743 Raghoji Bhonsla of Berar established himself at Nagpur, and by 1751 had conquered the territories of Deogarh, Chanda and Chhattisgarh. In 1741 Ratanpur had surrendered to the Mahrratta leader Bhaskar Pant without a blow, and the ancient Rajput dynasty came to an end. In Chanda and Deogarh the Gond rajas were suffered by Raghoji Bhonsla and his successor to carry on a shadowy existence for a while, in order to give them an excuse for avoiding the claims of the peshwa as their overlords; though actually decisions in important matters were sought at Poona. Raghoji died in 1755, and in 1769 his son and successor, Janoji, was forced to acknowledge the peshwa’s effective supremacy. The Nagpur state, however, continued to grow. In 1785, Mughdi (d. 1788), Janoji’s successor, bought from the Poona court the cession of Mandla and the upper Nerubudda valley, and between 1796 and 1798 this was followed by the acquisition of Hoshangabad and the larger part of Saugor and Damoh by Raghoji II. (d. 1816). Under this latter raja the Nagpur state covered practically the whole of the present Central Provinces and Berar, as well as Orissa and some of the Chota Nagpur states.

In 1803 Raghoji joined Sindhia against the British; the result was the defeat of the allies at Assaye and Argaon, and the treaty of Deogoa, by which Raghoji had to cede Cuttack, Sambalpur and part of Berar. Up to this time the rule of the Bhonsla rajas, rough warriors of peasant extraction, had been on the whole beneficent; but, soured by his defeat, Raghoji now set to work to recover some of his losses by a ruthless exploitation of the peasantry, and until the effective intervention of the British in 1818 the country was subjected to every kind of oppression. After Raghoji II’s death in 1816 his impecunious son Parsaji was deposed and murdered by Mudhoji, known as Appa Sahib. In spite of a treaty signed with the British in this year, Mudhoji in 1817 joined the peshwa, but was defeated at Sitabaldi and forced to cede the rest of Berar to the nizam, and parts of Saugor and Damoh, with Mandla, Betul, Seoni and the Nerubudda valley, to the British. After a temporary restoration to the throne he was deposed, and Raghoji III., a grandchild of Raghoji II., was placed on the throne. During his minority, which lasted till 1840, the country was well administered by a British resident. In 1853, on the death of Raghoji III. without heirs, Nagpur lapsed to the British paramount power. Until the formation of the Central Provinces in 1861, Nagpur province, which consists of the present Nagpur division, Chhindwara and Chhattisgarh, was administered by a commissioner under the central government.

The territories in the north ceded in 1817 by the peshwa (parts of Saugor and Damoh) and in 1818 by Appa Sahib were in 1830 formed into the Saugor and Nerubudda Territories under an agent to the governor-general, and in 1856 were included in the newly formed North-West Provinces. In 1842, in consequence of a rising, they were again placed under the jurisdiction of an agent to the governor-general. Restored to the North-West Provinces in 1853, they were finally joined with the Nagpur province to constitute the new Central Provinces in 1861. On the 1st of October 1903 Berar also was placed under the administration of the commissioner of the Central Provinces (for history see BERAR).

In 1905 the greater part of Sambalpur district, with the feudatory states of Barma, Rairakhel, Sonpur, Patna and Kalahandi, were transferred to Bengal, while the feudatory states of Chang Bhakar, Korea, Surguja, Udaipur and Jashpur were transferred from Bengal to the Central Provinces. During the decade 1891–1901 the Central Provinces suffered from famine more severely than any other part of India. The complete failure of the rain in the autumn of 1896 caused scarcity to develop suddenly into famine, which lasted until the end of 1897. The total number of persons in receipt of relief reached its maximum of nearly 700,000 in May 1897. The expenditure on relief alone was about a million sterling; and the total cost of the famine, including loss of revenue, amounted to nearly twice that amount. During 1897 the death-rate for the whole province rose to sixty-nine per thousand, or double the average, while the birth-rate fell to twenty-seven per thousand. The Central Provinces were stricken by another famine, yet more severe and widespread, caused by the complete failure of the rains in 1899. The maximum of persons relieved for the whole province was 1,071,000 in June 1900. In addition, about 68,000 persons were in receipt of relief in the native states. During the three years 1899–1902 the total expenditure on famine relief amounted to about four millions sterling. Berar also suffered from the famines of 1897 and 1900.

See The Imperial Gazetteer of India (Oxford, 1908), x. 99, for list of references.
their power to make or unmake a citizen. They also decided on questions concerning debt. Hence the plebs had an interest in securing their decisions against undue influence. They were never regarded as magistrates, but merely as juratores, and would be appointed for a fixed term of office by the magistrate, probably by the praetor urbano. But in Cicero's time they were elected by the Comitia Tributa. They then numbered 105.

Their original number is uncertain. It was probably increased by Augustus and in Pliny's time had reached 180. The office was probably open in quite early times to both patricians and plebeians. The term is also applied in the inscriptions of Veii to the municipal senators and Cures, which numbered 100 members.

CENTURION (Lat. centurio), in the ancient Roman army, an officer in command of a centuria, originally a body of a hundred infantry, later the sixtieth part of the normal legion. There were therefore in the legion sixty centurions, who, though theoretically subordinate to the six military tribunes, were the actual working officers of the legion. For the most part the centurions were promoted from the ranks; they were arranged in a complicated order of seniority; the senior centurion of the legion (primus pilus) was an officer of very high importance. Besides commanding the centuries of the legion, centurions were "seconded" for various kinds of special service, e.g. for staff employment, the command of auxiliaries. See further Roman Army.

CENTURPHE (from early Centorbi, anc. Keururan, or Centuripet), a town of Sicily, in the province of Catania, situated 2380 ft. above sea-level, in a commanding situation, 7 m. N. of the railway station of Catancena-Centuripet, which is 28 m. W. from Catania. Pop. (1901) 11,312. Thyucydides mentions it as a city of the Sicels. It became an ally of the Athenians at the time of their expedition against Syracuse, and maintained its independence almost uninterruptedly (though it fell under the power of Agathocles) until the First Punic War. Cicero describes it, perhaps with some exaggeration, as being far the largest and richest city of Sicily, and as having a population of 10,000, engaged in the cultivation of an extensive territory. It was granted Latin rights before the rest of Sicily. It appears to have suffered much in the war against Sextus Pompeius, and not to have regained its former prosperity under the empire. Frederick II. entirely destroyed it in 1233, but it was soon rebuilt. Considerable remains of the ancient city walls and of buildings, mostly of the Roman period, still exist, and numerous antiquities, including some fine Hellenistic terra-cottas, have been discovered in casual excavations.

See F. Ansald, I Monumenti dell' antica Centuripet (Catania, 1851); P. Orsi in Atti del Congresso Internazionale di Scienze Storiche (Rome, 1904), v. 177.

CENTURY (from Lat. centuria, a division of a hundred men), the name for a unit in the Roman army, originally amounting to one hundred men, and for one of the divisions into which the Roman people was separated for voting purposes (see Comitia). The word is applied to any group of one hundred, and more particularly to a period of a hundred years, and to the successive periods of a hundred years, dating before or after the birth of Christ. The "Century-plant" is a name given to the Agave (q.v.), or American aloe, from the supposition that it flowered once only in every hundred years.

CENTURION—CEPHALONIA

The ancient city, of the island of Cephallenia, is situated on the north coast of the island, about 3 m. from the north-west shore; it was an important commercial and naval center in the ancient world. It was founded by the Phlegraean Chalcidians, who were said to have been expelled from their native city by their king, and to have settled on the island of Cephallenia. The city was later taken by the Greeks, who named it in honor of the god Poseidon, who was believed to have granted them victory over the Persians in the Battle of Cynosseus. The city was subsequently conquered by the Romans, who made it a colony of the Roman Empire. It was then called Cephallenia, and it remained a Roman colony until the 5th century AD, when it was conquered by the Byzantines. Today, the city is known as Argostoli, and it is the capital of the island of Cephallenia. The city is known for its beautiful landscape, its clear blue waters, and its rich cultural heritage. It is a popular destination for tourists, who come to explore the city's many attractions, including its beautiful beaches, its historic sites, and its lively nightlife. The city is also known for its delicious cuisine, which features fresh seafood and locally grown produce. In conclusion, Cephallenia is a city that is rich in history and culture, and it is a place that is sure to delight visitors with its beautiful scenery and its welcoming atmosphere.
of Cephialonia have all along been extremely active; and no slight amount of toil has been expended in the construction of terraces on the steep sides of the hills. Owing to the thinness of the population, however, but a small proportion of the soil is under cultivation, and the quantity of grain grown in the island is comparatively meagre. The staple is the currant, in the production of which the island surpasses Zante. The fruit is smaller than that of the Morea, and has a peculiar flavour; it finds a market mainly in Holland, Belgium and Germany. The grape vine also is grown, and the manufacture of wine is a rising industry. The olive crop is of considerable importance, and the culture of cotton in the low grounds has been successfully attempted. Manufactures are few and undeveloped, but lace from the aloe fibre, Turkey carpets and basket-work are produced by the villagers, and boats are built at both the principal towns. Of all the seven Ionian islands Cephialonia and Zante are most purely Greek, and the inhabitants display great mental activity.

In the Homeric poems Cephialonia is generally supposed to be mentioned under the name of Same, and its inhabitants, among the subjects of Ulysses, to have been Cephialenes (see, under Ithaca). In the Persian War they took but little part; in the Peloponnesian they sided with the Athenians. The town of Pale was vainly besieged by Philip of Macedon in 218 B.C., because it had supported the Aetolian cause. In 189 B.C. all the cities surrendered to the Romans, but Same afterwards revolted, and was only reduced after a siege of four months. The island was presented by Hadrian to Athens, but it appears again at a later date as "free and autonomous." After the division of the Roman empire, it continued attached to Byzantium till 1082, when it was captured by Robert Guiscard, who died, however, before he could repress the revolt of 1085. In 1204 it was assigned to Gaius, prince of Tarentum, who accepted the protection of Venice in 1215; and after 1225 it was held along with Santa Maria and Zante by a succession of five counts of the Tocco family at Naples. Formally made over to Venice in 1550 by the prince of Tarentum, it was afterwards captured by the Turks in 1479; but the Hispanic-Venetian fleet under Benedetto Pessaro and Gonsalvo of Cordova effected their expulsion in 1550, and the island continued in Venetian possession till the fall of the republic. For some time it was administered for the French government, but in 1809 it was taken by the British under Cuthbert, Lord Collingwood. Till 1813 it was in the hands of Major de Bosset, a Swiss in the British service, who displayed an industry and energy in the repression of injustice and development of civilization only outdone by the despotism of Sir Charles Napier, who held the same office for the nine years from 1818 to 1827. During the British protectorate the island made undoubted advances in material prosperity, but was several times the scene of political disturbances. It retained longer than the sister islands traces of feudai influence exerted by the landed proprietors, but has been gradually becoming more democratic. Under the Venetians it was divided into eight districts, and an elaborate system of police was in force; since its annexation to Greece it has been broken up into twenty demarchies, each with its separate jurisdiction and revenues, and the police system has been abolished.

Authorities.—A special treatise on the antiquities of Cephialonia was written by Petrus Maurocenus. See Holland's Travels (1815); Ansted's Ionian Islands (1863); Viscount Kirkwall's Four Years in Ionian Islands (1864); Wieland's Die Insel Kephalonia; parlementaire, géologique, Recherches sur les Îlots Ionisiens (Paris, 1879-1880); Partsch, Kephallenia und Ithaka (1890); see also Corfu; Ionian Islands. (E. GR.)

CEPHALOPODA, the fifth of the classes into which the zoological phylum Mollusca is divided (see MOLLUSCA). The Cephalopoda are mainly characterized by the concrescence of the foot and head. The foot grows forward on each side so as to surround the mouth, the two upgrowths meeting on the dorsal side of the head—whence the name Cephalopoda. The perical portion of the foot is drawn out into paired arm-like processes; these may be beset with sheathed tentacles or with suckers or hooks, or both. The epipodia are expanded into a pair of muscular lobes right and left, which are bent round towards one another so that their free margins meet and constitute a short tube—the siphon or funnel. The hind-foot is either very small or absent. A distinctive feature of the Cephalopoda is their bilateral symmetry and the absence of anything like the torsion of the visceral mass seen in the Anisopleuridene Gastrupoda.

The anus, although it may be a little displaced from the median line, is approximately median and posterior. The mantle-skin is deeply produced posteriorly, forming a large sub-pallial chamber around the kidney. The sides of the anus are placed a little above the perforations of the nephridia, the genital apertures (paired only in Nautilus, in female Octopoda, female Ommatomastix and male Eledone), and the paired ctenidia. The visceral hump or dome is elevated, and may be very much elongated in a direction almost at right angles to the anterior margin of the body.

A shell is frequently, but not invariably, secreted on the visceral hump and mantle-skin. The shell is usually light in substance or strengthened by air-chambers in combination with the free-swimming function of the cephalopods, it is usually enclosed in folds of the mantle. Very numerous minute pigmented sacs, capable of expansion and contraction, and known as chromatophores, are usually present in the integument. The sexes are separate. The mantle-lining is divided into the cephalic region, which to the oyster-horned gill-plumes, serving as the efficient branchial organs (figs, 4, 24).

The vascular system is very highly developed; the heart consists of a pair of auricles and a ventricle (figs, 12, 28). Branchial hearts are present, and the heart is sub-system. It is not known to what extent the minute subdivision of the arteries extends, or whether there is a true capillary system.

The pericardium is extended so as to form a very large sac, passing through the visceral area and sometimes containing the ovary or testis—the visceroc-cardiac sac—which opens to the exterior either directly or through the renal organs. It has no connexion with the vascular system. The renal organs are always paired sacs, developing from the hae-matobranchia of which it is the anterior extension (fig. 29).

They open each by a pore into the visceroc-pericardial sac, except in Nautilus. The anal aperture is median and raised on a papilla. Jaws (fig. 6, 0) and a radula (fig. 9) are well developed. The jaws have a form of power, rather than the other horny or calcified (Nautilus), and are capable of inflicting severe wounds.

Cerebral, pleural and pedal ganglia are present, but the connectives are shortened and the ganglia concentrated and fused in the cephalic region. Large special ganglia (optic, stellate and supra-buccal) are developed, and the ganglia of each sense-organ are highly specialized, each exhibiting a very special elaboration of structure in the Dibranchiata, and a remarkable archaic form in the nautilus. Otoecysts are present in all. The typical ophidium is not present, except in Nautilus, but one ophidium is present in the cephalic region, which in the oyster-horned gill-plumes is ascribed both in Nautilus and in the other Cephalopoda.

Hermaphroditism is unknown in Cephalopoda, male and female individuals always being differentiated. The genital aperture and ducts are typical molluscan, and the seminal ducts separate the sexes. The oesophagus is not usually a straight tube but forms a complicated spiral (fig. 6, 24). The egg is large, and the development is much modified by the presence of an excessive amount of food-material diffused in the protoplasm of the egg-cell. Tritrophic and veliger stages of development are frequently not recognizable.

The Cephalopoda are divisible into two orders, Tetrabranchiata and Dibranchiata, the names of which (due to Sir R. Owen) describe the number of gill-plumes present; but in fact there are several characters, of as great importance as those derived from the gills, by which the members of these two orders are separated from one another.

Order I. TETRABRANCHIATA (= Schizosiphona, Tentaculifera).

Characters.—The involuted lateral margins of the epipodia are not fused, but form a siphon by apposition (fig. 4). The circumoral lobes of the foot-fore carry numerous retractile tentacles, not suckers (fig. 6). There are two pairs of ctenidial gills (hence Tetrabranchiata), and two pairs of renal organs, consequently four renal apertures (fig. 4). The visceroc-pericardial chamber opens by two independent apertures to the exterior, and not into the renal sacs. There are two oviducts (right and left) in the female, and two sperm-ducks in the male, the left duct in both sexes being rudimentary. A large external shell, either coiled or straight, is present, and is not enclosed by reflections of the
CEPHALOPODA

mantle-skirt. The shell consists of a series of chambers, the last-formed of which is occupied by the body of the animal, the hinder ones (successively deserted) containing gas (fig. 1). The pair of cephalic eyes are hollow chambers (fig. 14, A), opening to the exterior by minute orifices (pinhole camera), and devoid of refractive structures. A pair of osphradia are present at the base of the gills (fig. 4, of). Salivary glands are wanting. An ink-sac is not present. Branchial hearts are not developed on the branchial afferent vessels.

Visceral Hump and Shell.—The visceral hump of Nautilus (if we exclude from consideration the fine siphuncular pedicle which it trails, as it were, behind it) is very little, if at all, affected by the coiled form of the shell which it carries, since the animal always slips forward in the shell as it grows, and inhabits a chamber dorsal area of the visceral hump to the smallest and first-formed chamber of the series. No structure comparable to this siphuncular pedicle is known in any other Mollusca. The siphuncle does not communicate with the coelomic cavity; it is a simple vascular process of the mantle, whose cavity consists of a venous sinus, and whose wall contains a ramifications of the pallial artery. There appears to be no doubt that the deserted chambers of the nautilus shell contain in the healthy living animal a gas which serves to lessen the specific gravity of the whole organism. This gas is said to be of the same composition as the atmosphere, with a larger proportion of nitrogen. With regard to its origin we have only conjectures. Each septum shutting off an air-containing chamber is formed during a period of quiescence, probably after the reproductive act, when the visceral mass of the nautilus may be slightly shrunk, and gas is secreted from the dorsal integument so as to fill the space previously occupied by the animal. A certain stage is reached in the growth of the animal when no new chambers are formed. The whole process of the loosening of the animal in its chamber and of its slipping forward when a new septum is formed, as well as the mode in which the air-chambers may be used as a hydrostatic apparatus, and the relation to this use, if any, of the siphuncular pedicle, is involved in obscurity, and is the subject of much ingenious speculation. In connexion with the secretion of gas by the animal, besides the parallel cases ranging from the protozoon Acoliella to the physoclist fishes, from the hydroid Siphonophora to the insect-larva Corethra, we have the identical phenomenon observed in the closely allied Sepia when recently hatched. Here, in the pores of the internal rudimentary shell, gas is observable, which has necessarily been liberated by the tissues which secrete the shell, and not derived from any external source (Huxley).

The coiled shell of Nautilus, and of the majority of extinct Tetrabranchiata, is peculiar in its relation to the body of the animal, inasmuch as the curvature of the coil proceeding from the centro-dorsal area is towards the head or forwards, instead of away from the head and backwards as in other discord coiled shells such as Planois; the coil is in fact absolutely reversed in the two cases. Such a shell is said to be exogastric. But in some extinct forms, e.g. Pteramoceras, Tyloceras, Parameras, the shell is coiled towards the ventral side, when it is termed endogastric. Amongst the extinct allies of the nautilus (Tetrabranchiata) we find shells of a variety of shapes, open coils such as Scaphites, leading on to perfectly cylindrical shells with chamber succeeding chamber in a straight line (Orthoceras), whence again we may pass to the corkscrew spirals formed by the shell of Turrilites. In some extinct genera, e.g. Gomphoceras, among the Nautiloidea the aperture of the shell is contracted and the edge of the aperture is lobed. In these cases the animal was probably able only to protrude its appendages and not its whole head. The ventral part of the aperture corresponding to the funnel is separated from the dorsal part by a constriction. Hence it is possible to distinguish the ventral and dorsal sides of the shell and to decide whether it was exogastric or endogastric. The direction of the coil of the shell cannot be determined by the position of the siphuncle, which traverses the septa centrally, ventrally or dorsally. Contracted shell apertures occur also in Ammonoidae, the condition reaching an extreme in Morphoceras, where the original aperture is subdivided by the ingrowths of the sides, so that only five small separate apertures remain. Of these the central probably corresponded to the mouth, two lateral to the eyes, and the remaining two to the pedal appendages.

Head, Foot, Mantle-skirt and Sub-pallial Chamber.—In the pearly nautilus the ovoid visceral hump is completely encircled by the free flap of integument known as mantle-skirt (figs. 2, 3, d, e). In the antero-dorsal region this flap is enlarged so as to be reflected a little over the coil of the shell which rests on it. In the postero-ventral region the flap is deepest, forming an extensive sub-pallial chamber, at the entrance of which e is placed in fig. 3. A view of the interior
of the sub-pallial chamber, as seen when the mantle-skirt is retroverted and the observer faces in the direction indicated by the reference line passing from e in fig. 3, is given in fig. 4. With this should be compared the similar view of the sub-pallial chamber of the Dibranchiates. It should be noted again the difference between Nautilus and the Dibranchiates that in the former the nidamental gland (in the female) lies on that surface of the pallial chamber

FIG. 2.—Spirit specimen of female Pearly Nautilus, removed from its shell, and seen from the antero-dorsal aspect (drawn from nature by A. G. Bourne).

m, The dorsal "hood" formed by the enlargement of the outer or annular lobe of the fore-foot, and corresponding to the sheaths of two tentacles (g, s in fig. 6).

n, Tentacular sheaths of lateral portion of the annular lobe.

g, The left eye.

b, The nuchal plate, continuous at its right and left posterior angles with the root of the mid-foot, and corresponding to the nuchal cartilage of Sepia.

formed by the dependent mantle-flap (fig. 4, g.n; fig. 1, b), whilst in the latter it lies on the surface formed by the body-wall; in fact in the former the base of the fold forming the mantle-skirt comprises in its area a part of what is unrecognized visceral hump in the latter.

The apertures of the two pairs of renal sacs, of the visceropericardial sac, of the genital ducts, and of the anus, are shown in position on the body-wall of the pallial chamber of Nautilus in figs. 4, 5. There are nine apertures in all, one median (the anus)

and four paired. Besides these apertures we notice two pairs of gill-plumes which are undoubtedly typical ctenidia, and a short papilla (the osphradium) between each anterior and posterior gill-plume (see figs. 4, 5, and explanation). As compared with this in a Dibranchiate, we find (fig. 25) only four apertures, viz. the median anus with adjacent orifice of the ink-sac, the single pair of renal apertures, and one asymmetrical genital aperture (on the left side) except in female Octopoda and a few others, where the genital ducts and their apertures are paired. No visceropericardial pores are present on the surface of the pallial chamber, since in the Dibranchiata

the visceropericardial sac opens by a pore into each nephridium instead of directly to the surface. A single pair of ctenidia (gill-plumes) is present instead of the two pairs in Nautilus. The existence of two pairs of ctenidia and of two pairs of renal sacs in Nautilus, placed one behind the other, is highly remarkable. The interest of this arrangement is in relation to the general morphology of the Mollusca, for it is impossible to view this repetition of organs in a linear series as anything else than an instance of metameric segmentation, comparable to the segmentation of the ringed worms and Arthropoda. The only other example which we have of this metamericism in the Mollusca is presented by the Chitons. There we find not two pairs of ctenidia merely, but sixteen pairs (in some species more) accompanied by a similar metamericism of the dorsal integument, which carries eight shells. In Chiton the renal organs are not affected by the metamericism as they are in Nautilus. It is impossible on the present occasion to discuss in the way which their importance demands the significance of these two instances among Mollusca of incomplete or partial metamericism; but it would be

wrong to pass them by without insisting upon the great importance which the occurrence of these isolated instances of metameric segmentation in a group of otherwise unsegmented organisms possesses, and the light which they may be made to throw upon the nature of metameric segmentation in general.

The foot and head of Nautilus are in the adult inextricably grown together, the eye being the only part belonging primarily to the head which projects from the all-embracing foot. The fore-foot or front portion of the foot has the form of a number of lobes carrying tentacles and completely surrounding the mouth (figs. 2, 3). The epipodial inclined towards each other posteriorly so as to form an incomplete siphon (fig. 4), a condition which is completed and rendered permanent in the tubular funnel of Dibranchiata. The epipodial nature of the funnel is well seen in young embryos, in which this organ is situated laterally and posteriorly between the mantle and the foot.

The lobes of the foot of Nautilus and of the other Cephalopoda require further description. It has been doubted whether these lobes were rightly referred (by T. H. Huxley) to the fore-foot, and it has been maintained by some zoologists (H. Grenacher, H. von
Fig. 5.—View of the postero-ventral surface of a male Pearly Nautilus, the mantle-scarf (c) being completely reflected so as to show the inner wall of the sub-pallial chamber, and the four tentacles and the foot cut short (drawn from nature by A. G. Bourne). pe, Penis, being the ventrally elongated termination of the right spermathecal duct (fig. 4). The fig. 4 shows the rudimentary left spermathecal duct (pyriform sac of Owen). Other letters as in fig. 4.

Inferior because it really lies ventralwards of the mouth. This inferior lobe is a fairly large one, representing a right and left inferior lobe fused into one. A lamellated organ on its surface, known as Owen's organ, probably olfactory in function (n), marks the separation of the constituent halves of this double lobe. Each half carries a group of fourteen tentacles. The right and the left inferior lobes (c, c) each carry twelve tentacles. External to these three lobes the muscular substance of the mouth-exposing foot is raised into a wide ring, which becomes especially thick and large in the dorsal region where it is notably modified in form, offering a concavity into which the coil of the shell is received, and furnishing a protective roof to the retracted mass of tentacles. This part of the external annulus is a circular plate, which is called the "hood" (figs. 2, 3, 4). The median anterior-posterior line traversing this hood exactly corresponds to the line of concrescence of the two halves of the foot which primitively grew forward on the outer side of the ventral foot, together forming a ring in the front of the mouth. The tentacles carried by the genital annuli are nineteen on each side, thirty-eight in all. They are called "digital," and are somewhat larger than the "labial" tentacles carried on the three inner lobes. The dorsalmost pair of tentacles (marked g in fig. 6) are the only ones which look belong to that part of the disk which forms the great dorsal hood m. The hood is, in fact, to a large extent formed by the enlarged sheaths of these two tentacles. All the tentacles of the circumoral disk are set in remarkable tubular sheaths, into which they can be drawn to form a solid mass. The sheaths of some of those belonging to the external or annular lobes are seen in fig. 3, marked n. The sheaths are muscular as well as the tentacles, and are simply tubes from the base of which the solid tentacles project. The term "laminated" for the sheath is not really an appropriate term as obscure as its morphological origin. With reference to the latter, it appears highly probable that the tubular sheath representing the cup of a sucker such as is found on the foot of the Digranchiata. In any case, it seems to the writer impossible to believe that each tentacle, and its sheath on a lobe of the circumoral disk of Nautilus, corresponds to a sucker on such a lobe of a Dibranchiate. W. Keferstein follows Sir R. Owen in strongly opposing this identification, and in regarding such tentacle as the equivalent of an annular lobe or arm of a Decapod or Octopod Dibranchiate. The details of these structures, especially in the facts concerning the hectocotylus and spadix, afford the most conclusive reasons for dissenting from Owen's view. On the ventral side an extensive part of the internal surface of the muscular ring is laminated, forming the so-called "organ of Valenciennes," peculiar to the female and serving for the attachment of the spermatophores. We have so far enumerated in the female nautilus ninety tentacles. Four more remain which have a very peculiar position, and almost lead to the inference that the eye itself is a modified tentacle. These remaining tentacles

Fig. 6.—Male (upper) and female (lower) specimens of Nautilus pompilius as seen in the expanded condition, the observer looking down on to the buccal cone e, one-third the natural size linear. The drawings have been made from actual specimens by A. G. Bourne, B.S.C., University College, London.

a. The shell.

b. The outer ring-like expansion (annular lobe) of the circumoral muscular mass of the foot-foot, carrying nineteen tentacles on each side—posterolaterally this is enlarged to form the "hood" (marked v, fig. 1 and m, figs. 2 and 3), giving off the pair of tentacles marked g in the present figure.

c. The right and left inner lobes of the foot-foot, each carrying twelve tentacles in the female, in the male subdivided into p, the "spadix" or hectocotylus on the left side, and q, the "anti-spadix," a group of four tentacles on the right side—this is thus seen that the subdivided right and left inner lobes of the male correspond to the undivided right and left inner lobes of the female.

d. The inner inferior lobe of the foot-foot, a bilateral structure in the female carrying two groups, each of fourteen tentacles, separated from one another by a lamellated organ n, supposed to be olfactory in function—in the male the inner inferior lobe of the foot-foot is very much reduced, and has the form of a paired group of lamellae d (in the upper figure).

e. The buccal cone, rising from the centre of the three inner lobes, and fringing the proximad calcaraceous beaks or jaws with a series of minute papillae.

f. The tentacles of the outer circumoral lobe or annular lobe of the foot-foot, projecting from their sheaths.

g. The two most posterior tentacles of this series belonging to that part of the annular lobe which forms the hood (m in figs. 2 and 3).

h. Superior ophthalmic tentacle.

i. Inferior ophthalmic tentacle.

j. Eye.

k. Eyed lobe.

l. Eyed lobe.

m. Paired laminated organ on each side of the base of the inner inferior lobe (d) of the female.

n. Ofactory lamellae upon the inner inferior lobe (in the female).

o. The siphon (mid-foot).

p. The spadix (in the male), the hectocotylized portion of the left inner lobe of the foot-foot representing four modified tentacles, eight being left unmodified.

q. The anti-spadix (in the male), being four of the twelve tentacles of the right inner lobe of the foot-foot isolated from the remaining eight, and representing on the right side the differentiated spadix of the left side. The four tentacles of the anti-spadix are set, three on one base and one on a separate base.
are placed one above (before) and one below (behind) each eye, and bring up the total to ninety-four (fig. 3 v, v).

In the adult male nautilus we find the following important differences in the tentaculiferous disk as compared with the female (see up-fronting page). The inner inferior lobe is rudimentary, and carries no tentacles. It is represented by three groups of lamellae (d), which are not fully exposed in the drawing. The right and left inner lobes are subdivided each into two portions. The right shows a larger portion carrying eight tentacles, and a curiously short body beneath, and the left shows a group of (g) of four tentacles, of which three have their sheathes united whilst one stands alone. These four tentacles may be called the "anti-spadix." The left inner lobe shows a similar larger portion carrying eight tentacles, and a curious shorter body beneath, and the right shows the "anti-spadix." This is the "spadix." It carries no tentacles, but is terminated by imbricated lamellae. These lamellae appear to represent the four tentacles of the anti-spadix of the right internal lobe, and are generally regarded as corresponding to the modification of the sucker-bearing arms of male Dibranchiate Siphonopods to which the name "hectocotylus" is applied. The spadix is in fact the hectocotylized portion of the fore-foot of the male nautilus. The hectocytolized arm or lobe of male Dibranchiata is connected with the process of copulation, and in the male nautilus the spadix has probably a similar significance, though it is not possible to suggest how it acts in relation to this. It is important to observe that the modification of the fore-foot in the male as compared with the female nautilus is not confined to the existence of the spatulad anti-spadix and the reduction of the inner inferior lobe are also male peculiarities. The external annular lobe in the male does not differ from that of the female; it carries nineteen tentacles on each side. Thus it is clear that the nautilus, after Furbringer we find altogether sixty-two tentacles, the thirty-two additional tentacles of the female being represented by lamelliform structures.

Musculature, Fins and Cartilaginous Skeleton.—Without entering into a detailed account of the musculature of Nautilus, as may be pointed out that the great muscular masses of the fore-foot and of the mid-foot (siphon) are ultimately traceable to a large transverse mass of muscular tissue, the ends of which are visible through the integument on the right and left surfaces of the body dorsal of the free flap of the mantle-skin (fig. 14), and fig. 15). These muscular areas have a certain adhesion to the shell, and are served both to hold the animal in its shell and as the fixed supports for the various movements of the tentaculiferous lobes and the spadix. They are to be identified with the ring of musculature which is a remnant of the muscular column attached to the shell of that animal. In the Dibranchiate the a similar origin of the muscular masses of the fore-foot and mid-foot from the sides of the shell—modified, as this is, in position and relations—can be traced.

In Nautilus there are no fin-like expansions of the integument, whereas in the Decapod Dibranchiates along the sides of the viscolophous hump (fig. 15, 16). As an exception among Octopoda the lateral fins occur in Pinnaulina (fig. 8 A, B). In Cirrhoteuthis (fig. 38, D). Nautilus has there a curious plate-like expansion of the integument, as well as the dorsal region just behind the hood, lying between that structure and the portion of mantle-skin which is reflected over the shell. This is shown in fig. 2, b. If we trace out the margin of this plate we find that it becomes continuous on each side with the sides of the funnel. In Sepia and other Dibranchipoda (Octopoda) a closely similar plate exists in an exactly corresponding position (see b in figs. 10, 26). In Sepia a cartilaginous process forms here immediately below the integument forming the so-called "nuchal plate," drawn in fig. 8, D. The morphological significance of this nuchal lamella has been long disputed and in Sepia is not obvious. Cartilage having the structure shown in fig. 7 occurs in various regions of the body of Cephalopoda. In all Glossophorous mollusca the lingual apparatus is supported by internal skeletal pieces, having the character of cartilage, but in the Cephalopoda such cartilage has a wider range.

In Nautilus a large H-shaped piece of cartilage is found, forming the axis of the funnel (fig. 8, A, B). Its hinder part extends up into the head and supports the peri-oesophageal nerve-mass (a), whilst its two anterior rami extend into the tongue-like siphon. In Sepia, and Dibranchia generally, the cartilage takes a different form, as shown in fig. 8, C. The processes of this cartilage cannot be identified in any way with those of the capito-pedal cartilage of Nautilus. The lower larger portion of this cartilage in Sepia is called the cephalic cartilage, and forms a complete ring round the oesophagus; it completely invests also the ganglion nerve-collar, so that all the nerves from the latter have to pass through foramina in the cartilage. The outer angles of this cartilage spread out on each side so as to form a cup-like receptacle for the eyes. The two processes springing right and left from this cartilage in the median line (fig. 8, C) are the "nuchal cartilages"; in front of these, again, there is seen a piece like an inverted T, which forms a support to the base of the arms of the fore-foot, and is the "basal-challic" cartilage. The Decapod Dibranchiates have, further, the "nuchal cartilage" already mentioned, and in Sepia, a thin plate-like "sub-ostracal" or (so-called) dorsal cartilage, the anterior end of which rests on and aids in the contraction of the cephalic cartilage. In Octopoda there is no nuchal cartilage, but two band-like "dorsal cartilages." In Decapods there are also two cartilaginous sockets on the sides of the funnel—"siphon-hinge-cartilages"—into which fleshy knobs of the mantle-

**Fig. 8.—Cartilaginous skeleton of Cephalopoda (after Keferstein).**

A, Capito-pedal cartilage of Nautilus pompilius. a points to the ridge which supports the pedal portion of the nerve-centre.

B, Lateral view of the same—the larger anterior processes are sunk in the muscular substance of the siphon.

The skin are loosely fitted. In Sepia, along the whole base-line of each lateral fin of the mantle (fig. 15), is a "lata-pierygial cartilage." It is worthy of remark that we have, thus developed, in Dibranchiate Cephalopoda a more complete internal cartilaginous skeleton than is to be found in some of the lower vertebrates. There are other instances of cartilaginous endo-skeleton in groups other than the Vertebrata. Thus in some capito-branchediate Chaeotopoda cartilage forms a skeletal support for the gill-plumes, whilst in the Arachnids (Mygale, Scorpio) and in Limulus a large internal cartilaginous plate—"endo-sterite"—is developed as a support for a large series of muscles.

**Alimentary Tract.**—The buccal cone of Nautilus is terminated by a villous margin (buccal membrane), surrounding the pair of beak-like jaws, of which the ventral projects over the dorsal. These are very strong and dense in Nautilus, being calcified. Fossilized beaks of Tetrabranchiata are known under the name of rhynchothites. In Dibranchia the teeth are horned, but similar in shape to those of Nautilus. They resemble in general those of a parrot, the lower beak being the larger and overlapping the upper dorsal beak. The lingual ribbon and odontophoral apparatus have the structure which is given in Glossophorous Mollusca. In Nautilus it is represented a single row of teeth from the lingual ribbon of Nautilus, and in fig. 9, B, C, of other Cephalopoda.

In Nautilus a long and wide crop or dilated oesophagus (fig. 10, e) passes from the buccal buccal mass, and at the apex of the visceral hump passes into a highly muscular stomach, resembling the gizzard of a bird (fig. 10, g). A nearly straight intestine passes from the muscular stomach to the anus, near which it develops a small caecum. In other Cephalopods the oesophagus is usually narrower and the muscular stomach more capacious, whilst a very important feature in the alimentary tract is formed by the caecum. In all Nautilus the caecum lies near the stomach, and may be very capacious—much larger than the stomach in Loligo vulgaris—or elongated into a spiral coil. The simple U-shaped flexure of the alimentary tract, as seen in fig. 10, is the only important one which it exhibits in the Cephalopoda. The acini of the large liver of Nautilus are compacted into a solid reddish-brown mass by a firm
membrane, as also is the case in the Dibranchiata. The liver has four paired lobes in *Nautilus*, which open by two bile-ducts into the alimentary canal at the commencement of the intestine. The bile-ducts unite before entering the intestine. In Dibranchiata the two large lobes of the liver are placed antero-dorsally (beneath the shell.

---

**Fig. 9.**—Lingu: dentition of Cephalopoda. A, A single row of lingual teeth of *Nautilus pompilius* (after Kefferstein). B, Two rows of lingual teeth of *Sepia officinalis* (after Troschel). C, Lingual teeth of *Eledone circassia* (after Loven).

**Fig. 10.**—Diagram representing a vertical approximately median antero-posterior section of *Nautilus pompilius* (from a drawing by A. G. Bourne). The parts which are quite black are the cut muscular surfaces of the foot and buccal mass.

---

**CEPHALOPODA**

*Nauzilus* the equivalents of the pancreatic diverticula of the Dibranchiata can be traced upon the relatively shorter bile-ducts.

Posterior salivary glands are not developed in *Nautilus*, but on each side in the wall of the buccal mass is a gland corresponding to the anterior salivary gland of the Dibranchiata. No ink-sac is present in *Nautilus*.

**Coelom, Blood-vascular System and Excretory Organs.**—*Nautilus* and the other Cephalopoda conform to the general Molluscan characters in regard to these organs. Whilst the general visceral cavity forms a lacunar blood-system or series of narrow spaces, connected with the trunks of a well-developed vascular system, that part of the original coelom surrounding the heart and known as the Molluscan pericardium is shut off from this general blood-lymph system, and communicates, directly in *Nautilus*, in the rest through the renal sacs, with the exterior. In the Cephalopoda this specialized pericardial cavity is particularly large, and has been recognized as distinct from the blood-carrying spaces, of which we have not considered the pericardial space of other Mollusca to be thus isolated. The enlarged pericardium, which may even take the form of a pair of sacs, has been variously named, but is best known as the visceropericardial sac or chamber. In *Nautilus* this sac occupies the whole of the postero-dorsal surface and a part of the antero-dorsal (see fig. 10, x), investing the genital and other viscera which lie below it, and having the ventricle of the heart suspended in it. Certain membranes form incomplete septa, and a curious muscular band—the pallio-cardiac band—traverses the sac. The four branchial afferent vessels, which in traversing the walls of the four renal sacs give off, as they were, glandular diverticula into those sacs, also go round the same points four much larger glandular masses, which hang freely into the visceropericardial chamber (fig. 11, r.e). In *Nautilus* the visceropericardial sac opens to the exterior directly by a pair of apertures, one placed close to the right and one close to the left posterior renal aperture (fig. 5, visc. per). This direct opening of the pericardial sac to the exterior is an exception to what occurs in all other Mollusca. In all other Mollusca the pericardial sac opens into the renal organs, and through them to the exterior (fig. 5, visc. per). Parallel cases of such shifting are seen in the varying position of the orifice of the ink-bag in Dibranchiata, and in the orifice of the genital ducts of *Mollusca*, which in some few cases (e.g., *Spondylus*) lead into the renal organs, whilst in other cases they open close by the side of the renal organs on the surface of the body. The visceropericardial sac of the Dibranchiata is very large also, and extends into the dorsal region. It varies in
shape—that is to say, in the extensions of its area right and left between the various viscera—in different genera, but in the Decapods is largest. In an extension of this chamber is placed the ovary of Sepia, whilst the ventricle of the heart and the branchial hearts and their appendages also lie in it. It is probable that water is drawn into this chamber through the renal sacs, since sand and other foreign matters are found in it. In all it opens into the pair of renal sacs by an orifice on the wall of each, not far from the external orifice (fig. 29, y, y'). There does not seem any room for doubting that each orifice corresponds to the reno-branchial orifice which we have seen in the Gastropoda, and shall find again in the Lamellibranchiata.

The circulatory organs, blood-vessels and blood of Nautilus do not appear to have been studied from those of Gastropoda. The ventricle of the heart is a four-cornered body, receiving a dilated branchial efferent vessel (auricle) at each corner (fig. 11). It gives off a cceliac aorta anteriorly, and a smaller abdominal aorta posteriorly. The diagram, fig. 12, shows the lateral forms of the aorta, the radial vessel of a worm or an Arthropod, and how by a simple flexure of the ventricle (D) and a subsequent suppression of one auricle, following on the suppression of one branchia, one may obtain the typical vascular system of Nautilus (excepting the Aspidobranchiata). The flexed condition of the heart is seen in Octopus, and is to some extent approached by Nautilus, the median vessels not presenting that perfect parallelism which is shown in the future (B). The most remarkable feature presented by the heart of Nautilus is the possession of four instead of two auricles, a feature which is simply related to the metamereism of the branchiae. By the left side of the heart of Nautilus, attached to it by a membrane, and hanging loosely in the viscero-branchial chamber, is the pyriform sac of Owen. This has been shown to be the rudimentary left ovul duct or sperm-duct, as the case may be (E. K. LANCESTER and E. BOURNE), the functional right ovul-sac and its duct being attached by a membrane to the opposite side of the heart.

The cceliop and abdominal aorta of Nautilus appear, after running, to the anterior and posterior extremity of the animal, respectively, to open into sinus-like spaces surrounding the viscera, muscular masses, &c. These spaces are not large, but confined and shallow. Capillaries are stated to occur in the integument, in the Dibranchiata the arterial system is very much more complete; it appears in some cases to extend in irregular lacunae or sinuses in other cases in true capillaries which lead on into veins. An investigation of these capillaries in the light of modern histological knowledge is much needed. From these sinususes and capillaries the veins take origin, coming from the muscular and connective tissue, which, as in the Dibranchiata as well as in Nautilus has a ventral (postero-ventral) position, and runs parallel to the long axis of the animal. In Nautilus this venous cava gives off at the level of the gills four branchial afferent veins (y, y'), which pass into the sinuses without dilating. In the Dibranchiata at a similar position the venous cava gives off a right and a left branchial afferent vein, each of which, traversing the wall of the corresponding renal sac and receiving additional factors, dilates near the base of the corresponding cymbal (nervi branchiales). In Nautilus from the dilated branchial heart the branchial afferent vessel proceeds, running up the adnial vessels of the gill-plate. From each gill-plume the blood passes by the branchial efferent vessel (aorta) to the heart, the two auricles being led by the main vessel of each of these vessels.

The blood contains the usual amoeboid corpuscles, and a diffused colouring matter—the haemocyanin of Fredericque— which has been found also in the blood of Helix, and in that of the Arthropoda. 

Homarus and Limulus. It is colourless in the oxidized, blue in the deoxidized state, and contains copper as a chemical constituent.

The renal sacs and gonad glandular tissue are closely connected with the branchial advehent vessels in Nautilus and in the other Cephalopoda. The arrangement is such as to render the typical relations and form of a renal tube difficult to trace. In accordance with the recent investigations of Mr. W. K. LANCESTER and Mr. H. STONE, the ovum is shed from the wall of the sac, to the exterior, by a pore opening by a pore to the exterior. As is usual in renal tubes a glandular and a non-glandular portion are distinguished in each sac; these portions, however, do not make up a whole tube, but are parts of a tube in other genera, but they are localized areas of the wall of the sac. The renal glandular tissue is, in fact, confined to a tract extending along that part of the sac's wall which immediately invests the great branchial arteries. The sac is dilated to a complete herbage of little venules, which branch and anastomose with one another, and are clothed by the glandular epithelium of the renal sac. The secretion is accumulated in the sac and passed by its apertures, and, by the posterior end of the sac, and is thrown out into the water in the form of a tube to the exterior, which is characterized by the "apparatus" of the branchial hearts of Dibranchiata.

The chief difference, other than that of number, between the renal organs of the Dibranchiata and those of Nautilus, is the absence of the accompanying growth in the Dibranchiata of the visceral-branchial space just mentioned, and, of more importance, the presence of a pore leading from the renal sac into the visceral-branchial space (y, y' in fig. 20). The outer orifices of the renal organs are also modified in the Dibranchiata (4), with a posterior opening of the renal sac being raised on papillae (np, np in fig. 20; r in fig. 20). In Sepia the two orifices open off each a diverticulum dorsawards, which unites with its fellow and forms a great median renal chamber, lying between the ventral portions of the renal sacs and the viscero-branchial chamber.

In Loligo the fusion of the two renal organs to form one sac is still more obvious, since the venal portions are united. In Octopus the renal sacs are quite separate.

Gonads and Genital Ducts.—In Nautilus it has been shown by E. K. LANCESTER and A. G. BOURNE that the genital ducts of both sexes are situated in the right branchial heart, forming the "pyriform appendage," described by Sir R. OWEN as adhering by membranous attachment to the ventricle of the heart, and shown by W. KEFFER to communicate by a pore with the exterior. The genital organ or testis is fully described in Nautilus, as in the Dibranchiata, in a distinct cavity walled off from the other viscera, near the centro-dorsal region. This chamber is formed by the coelomic or peritoneal wall; the space enclosed is original, and there is no communication with that of Nautilus proper, that is, the gonad itself appears to represent a single median or bilateral organ.

The ovary forms a large projection into the genital coelom, and the coelomic epithelium is deeply invaginated into the mass of the coelom to constitute an ovarian cavity communicating externally with the coelom by a narrow aperture. The ovary in the epithelium, migrate below it and then, as they enlarge, project into the ovarian cavity, pushing the epithelium before them. Each ovum is surrounded by a membrane which, with digestive vacuoles and a group of minute glandular tubules, penetrates into the ovum in numerous folds. When mature, the ovum is contained in a membrane or chorion with a micropyle, and escapes by deluscence of the ovum. In the oviparous Nautilus, the ovum is laid outside the body as a result of the ovulating process, the ovum passes a glandular structure on the wall of the genital capsule, which probably secretes the gelatinous substance enclosing the eggs. In addition to this internal gland there are other smaller parenchymatous secreting organs, the genital duct or sac but are differentiations of the wall of the pallial cavity, and occur on the inner wall of the pallial in Nautilus, on the somatic wall in Dibranchiata. In Nautilus they form a continuous mass. The whole oviparous Nautilus is a glandular tube.

In the male the testes is a specialized portion of the wall of the genital coelom, and has a structure comparable to that of the ovary. The spermatogonia pass through an orifice from the cavity of the testes to be captured by the spermatophore tube. The spermatophore duct is provided with a glandular pouch, and opens into a terminal reservoir known as Needham's sac or the spermatophore sac. The function of this pouch is to form the spermatophore, which is an accessory gland, and is secreted and invaginated into itself. The deeper part contains the spermatophore sac, and is connected with the peritoneum by a clear sac, called the connective, and is usually much contracted and spirally
coiled. When the spermatozoa is expelled into the water the connective is extended and evacuated, and the sac containing the sperms bursts. In *Nautilus* the spermatozoa when uncoded is a little over 30 mm. in length. These spermatozoa are somewhat similar to those formed in *Tetrabranchia*. The eggs are laid shortly after copulation. In *Nautilus* they are laid separately, each being about 4 cm. long and contained in two thick shells, the outer of which is partly open.

**Nervous System.**—Although the *Nautilidae* are not a very large family, when *Nautilus* is considered, for it is the only living genus of that family, it shows an elaboration of the nervous system that is of interest. This is especially well shown in the form of the ganglia and nerve-commissures, which is characteristic of the cephalopod class as a whole. The ganglia are laid in the form of a crown around the cerebral ganglia and connected with the hypoglossal ganglia by a series of commissures. The cerebral ganglia are found in the brain, the hypoglossal ganglia in the head, and the commissures connect the two. The nervous system is formed of a series of ganglia and nerve-commissures, which are laid in the form of a crown around the cerebral ganglia and connected with the hypoglossal ganglia by a series of commissures.

**Special Sense-Organ.**—The *Nautilus* possesses other organs of the head, such as the eyes, which are found in the form of a crown around the cerebral ganglia and connected with the hypoglossal ganglia by a series of commissures.

**Eye.**—The eye of *Nautilus* is a simple one, located above the cerebral ganglia. It is composed of a single lens, which is surrounded by pigment and connected with the filaments of an optic nerve. The eye is of the type of the limpet (*Patella*), and in such a simple eye we obtain the clearest demonstration of the fact that the retina of the cephalopod eye is essentially a modified form of the general epidermis, and that the sensitiveness of its cells to the action of light and their relation to nerve-filaments is only a specialization and intensification of a property common to the whole epidermis of the animal. In *Nautilus* the size of the eye is large, and the nerve-filaments arise by a double root from the cerebral ganglia and give off to the stromal organ, which passes through the epidermis immediately below the radula and bears a cuticular filament on the outer side.

**Phylogeny and Classification.**—As *Nautilus* is the only living genus of the Tetrabranchia, its systematic position as regards all other cephalopods is not difficult, but it is not easy to construct the whole class. *Nautilus* is characterized by the fact that the retina does not form a vesicle, and the lens is always part of the integument.
Alpheus Hyatt, that the initial chamber of the Nautiloidea corresponds not to the protoconch of the Ammonoids, but to the second chamber of the latter, and that there existed in the young Nautiloids a true initial chamber, a protoconch which was either uncalcified or deciduous. The shell of the living Nautilus, in which the question as to its stater is unknown, and there is a little vacuity in the centre of the spiral shell which may have been originally occupied by the true protoconch.

The septa in the Nautiloidea are generally concave towards the aperture and the shell's curvature therefore directed backwards (fig. 1); in the Ammonoidea, on the other hand, there is a convexity usually towards the aperture, the curvature therefore directed forwards. The lines along which the edges of the septa are united to the shell are very unfused and lobed, whereas in the Ammonoidea they are varied in various degrees of complexity; the projections of the suture towards the mouth of the shell are called saddles, those in the Ammonoidea directed backwards, as in the Nautiloidea pierce the centres of the septa, and in fossil Nautiloids it is usually central or sub-central. In a few cases it is marginal, and in that case may be external, i.e. ventral, or internal, i.e. dorsal. In Ammonoidea, although they include some very few species, of the Nautiloids, whose unfused septa are connected backwards from the septa to the shell, there are those, and such forms are termed propodosis.

The Tetragonochactae were most abundant in the Palaeozoic and Mesozoic eras. The most ancient are the Trilobites, first in the Upper Cambrian, the genera being most numerous in the Palaeozoic period, and comparatively few surviving into the Secondary period. On the other hand, the Ammonoidea are scarce in Palaeozoic formations, being represented mainly by the above-mentioned families and genera. The sub-class is composed of generally simple shells, such as Clavulina and Enchonites. In the Secondary Ammonoidea were very abundant, both in genera and species and in individuals, and few local exceptions are none known to have survived even to the commencement of the Upper Cretaceous period.

It has been maintained by some zoologists that the Ammonoidea were Dichotrochae, though it would not follow from this that the shell was, therefore, internal. They are, however, generally classified with the conchifera because of the possession of an ink-ase in favour of this view. There can be little doubt that they gave rise to the Nautiloidea.

About 2500 fossil species are included in the Nautiloidea, but only a few in the living species. If some of the fossil forms are very large, the shell reaching a length of 2 metres, or 6 ft. 6 in. Of the Ammonoidea more than 5000 species have been described, and some of the coiled forms are 70 cm., or nearly 2 ft. 6 in. in diameter.

Associated with various forms of Ammonoids there have been found peculiar horned or calcified plates, sometimes contained within the body-chamber of the shell, sometimes wholly detached. The most characteristic form of these is the Synaptychus family. It consists of two bilaterally symmetrical halves, of somewhat semicircular shape, and attached to one another by their straight inner margins, like a pair of doors. In some cases the apertures are thin and horned, and in others it is thick with a large plate-like central wall, and having a principal layer with a peculiar cellular structure. The surface may be smooth or sculptured, and one side is usually marked by concentric lines of growth. Another type is similar, except that the halves are united in the middle line of the siphuncle, this being more or less encased in a calcified tube, called synaptychus; they occur in the body-chamber of species of Nautilus. Another form called anaptychus consists of a thin horned undivided plate which is concentrically striated. This is associated with the families of Strophomena and Conoclosternum.

Many theories have been proposed in explanation of these structures. According to Sir Richard Owen, the apertys is an operculum developed in a part of the body corresponding to the hood of Nautilus, and the opening of the shell being the eye. Recent research suggests that the animal is born on the surface of the eyewell gland, with the form and sculpturing of which in Nautilus it closely agrees. On this view the apertys would occur only in females. The most recent view is that these structures could not have been opercula because of their constant position inside the body-chamber, and that they were internal secretions at all, but a calcified internal cartilage situated at the base of the funnel.

Classification of Tetragochactae.—Cephalopods in which the mantle is entirely enclosed by a multilobulated hypodermal shell, which may or may not be coiled. Only the last compartment of the shell occupied by the body of the animal. Numerous pedal tentacles around aperture, which are retractile within sheaths. Haldes of the funnel not united. Two pairs of c-nerida, and two pairs of renal tubes without renopericardial apertures. Pericardium opens directly to exterior. Cephalic cartilage wholly ventral. Optic vesicles with apertures, without crystalline lens.

Sub-order 1. Nautiloidea.—Initial chamber not inflated, with dorso-ventral siphocrist at extremity.

Fam. 1. Orthoceratidae. Shell straight or slightly curved, with a simple aperture, large terminal chambers, and cylindrical siphuncle. Orthoceras, Silurian to Trias. Bactoceras, Silurian.

Fam. 2. Actinocerataidae. Shell straight or slightly curved, with wide siphuncle at middle level, and a complicated septal suture; actinoceras, Silurian to Carboniferous. Discoceras, Silurian. Huronia, Silurian. Loxoceras, Silurian to Carboniferous.

Fam. 3. Endocerataidae. Shell, wide with margina siphuncle, neck produced into tubes fitting into one another. Endoceras, Silurian.

Fam. 7. Cylocerataidae. Shell slightly curved, aperture simple, shell wide, septa elongated. Trias.

Fam. 8. Lisitidae. Shell coiled in one plane with the terminal part uncoiled, aperture contracted. Lithites, Silurian. Ophidoceras, Silurian.

Fam. 9. Trochocerataidae. Shell helicoidally coiled, dextral or sinistral, the last whorl generally uncoiled. Trochoceras, Devonian. Adelphoceras, Devonian.

Sub-order 2. Ammonitoidea.—Initial chamber spheroidal; siphuncle narrow and simple; septa convex towards aperture; sutures complex.

Tribe 1. Retrosiphonata.—Siphuncle necks projecting behind the septa as in Nautiloidea. Sutures form simple undulations. Operculum present, generally in the form of a strophomena, or, from evolution, in the form of a simple helix or paracone.

Fam. 2. Cloumbridae. Shell nautiloid, with simple sutures, siphuncle dorsal, that is, internal. Clymenia, Upper Devonian.

Fam. 1. Aplexoceratidae. Shell lobed, some of the forms with a very few, only a few of the chambers, and the central part is long, hollowed out and united into one. Aplexoceras, Jurassic, Forma.

Fam. 2. Pinacocecorataidae. Shell compressed, smooth, terminal chamber short, sutures very complicated, convex. Pinacocecora, Trias.

Fam. 3. Phyllocerataidae. Shell coiled, the whorls overlapping each other, sutures formed of numerous lobes and saddles. Phylloceras, Jurassic.

Fam. 7. Ammonitidae. Shell coiled, with narrow whorls which do not embrace one another, aperture simple, a horny synaptychus present. Ammonites, Jurassic. Arietes, Jurassic. Aegoceras, Liis.

Fam. 8. Harpocerataidae. Shell discolored and flattened, with a carinated border, aperture provided with lateral projections.
a calcareous aptychus, formed of two pieces, *Harpaeceras*, Jurassic. *Oppelia*, Jurassic. *Lissoceras*, Jurassic and Cre- 
taceus.

Fam. 9. *Amaltheidae*. Shell flattened, with a prominent carina continued anteriorly into a rostrum. *Amaltheus*, Linn. Cephalo- 
ceras, Jurassic. Schloenbachia, Cretaceous.

Fam. 10. *Stephanoceratae*. Shell not carinated, but with radiating costae, which are often bifurcated, aperture often with 
lateral projections which contract it, aptychus formed of two 
pieces. *Stephanoceras*, *Morphoceras*, *Pezosiphonites*, *Peloroceras*, 
are related to this family, viz. *Scaphites*, *Crioceras*, Cretaceous.

**Order 2. Dibranchiata (= Holosiphon, Acetabulisera)**

Characters.—Cephalopods in which the inflected margins of the 
epipodia are fused so as to form a complete tubular siphon (fig. 24, f). The circumoral lobes of the 
fofront carry suckers disposed upon them in rows, not tentacles (see figs. 15, 24).

There is a single pair of typical ctendia (fig. 25) acting as gills 
(hence Dibranchiate), and a single pair of renal organs, opening 
by apertures right and left of the median anus (fig. 25, r) and by 
similar internal pores into the pericardial chamber, which 
consequently does not open directly to the surface as in *Nautilus*. 

The oviducts are sometimes paired right and left (Octopoda, 
*Oligopoda, Oligopsis*), sometimes that of one side only is developed (Myop-
sida). The sperm-duct is always single except, according to 
W. Keferstein, in *Eledone moschata*.

A plate-like shell is developed in a closed sac formed by the 
mantle (figs. 20, 21), except in the Octopoda, which have none, 
and in *Spirula* (fig. 17, D) and the extinct *Belemnitidae*, &c., 
which have a small chambered shell resembling that of *Nautilus* 
with or without the addition of plate-like and cylindrical acces-
sory developments (fig. 17, A, C, fig. 19).

The pair of cephalic eyes are highly-developed vesicles with a 
refractive lens (fig. 33), cornea and lid-folds,—the vesicle being 
in the embryo, an open sac like that of *Nautilus* (fig. 34). Os-
phrada are not present, but cephalic olfactory organs are recog-
nized. One or two pairs of large salivary glands with long ducts 
are present. An ink-sac formed as a diverticulum of the rectum 
and opening near the anus is present in all Dibranchiata (fig. 25, l), 
and has been detected even in the fossil *Belem-
nitidae*. Branchial 
hearts are developed on 
the two branchial affer-
ent blood-vessels (fig. 
28, w', w).

In the Dibranchiata the 
shell shows various 
stages of degeneration, 
culminating in its com-
plete disappearance in 
*Octopus*. As in other 
Mollusca, there is a tend-
cency in Cephalopods for 
the mantle to extend 
over the outside of the 
shell from its edges, and 
when these secondary 
mantle-folds entirely 
cover the shell and meet or fuse together the shell 
is surrounded by the mantle both externally 
and internally, and is 
said to be internal, 
though remains always 
a cuticular structure ex-
ternal to the epidermis.

This process is generally accompanied 
by a reduction of the size of the shell in comparison with 
that of the body, so that the relations of the two are gradu-
ally reversed, the body outgrows its house and instead of the
mantle being enclosed by the shell, the
shell is enclosed by the process is shown in the recent *Spirula*, though it is perhaps not impossible that in some of the later fossil Ammonoids the shell was becoming more and more internal. The shell of *Spirula* (fig. 18) is coiled somewhat like that of *Nautilus*, but the coils are not in contact, the direction of the coil is endogastric or ventral instead of exogastric, and the shell is very much smaller than the body. Like that of *Nautilus* it is divided by septa and traversed by a siphuncle. The relation of the animal to the terminal chamber is as in *Nautilus*, but the body of the mantle grow up over the shell and cover it everywhere except part of the dorsal and ventral surfaces.

The next modification in the enclosed shell is the addition to it of secondary deposits of calcareous matter, by the inner surface of the shell-sac. Successive layers are deposited on the posterior part of the original shell, whether coiled or straight, and these layers form a conical mass, which may attain great thickness. A somewhat coiled shell with such a deposit is seen in *Spirilurostra* (fig. 17, C) of the Miocene. In the next stage of modification secondary secretion forms a long and broad projection of the dorsal lip of the aperture; this is well developed in the belemmites (fig. 19). Thus in these modified shells three parts are to be distinguished: the original septate shell, which has been called the phragmacone; the posterior conical deposit, called the rostrum or guard; and the anterior somewhat flat projection, called the proöstracum. In the living *Dibranchiata* other than *Spirula* the phragmacone and rostrum have become very rudimentary. The shell of *Sepia* (fig. 20) consists almost entirely of the proöstracum, the little ventral hollow posteriorly representing the phragmacone, and the posterior pointed projection, the rostrum. In the *Oligopoda* the shell is represented by a proöstracum which is no longer calcified but forms a chitinous plume or gladius, and a similar rudiment occurs in *Loliginidae* (fig. 21) and *Sepiolidae*. Lastly, in the Octopoda the shell is represented only by small chitinous rudiments to which the retractor muscles of the head and funnel are attached; these are paired in *Octopus*, unpaired in other cases as in *Cirrhoteuthis*.

**Fig. 21.**—The horny internal shell or gladius or pen of * Loligo*.

The early appearance of the sac of the mantle in which the shell is enclosed has led to an erroneous identification of this sac with the primitive shell-sac or shell-gland of the Molluscan embryo. The first appearance of the shell-sac in *Dibranchiata* is shown in figs. 35, 36. Its formation as an open upgrowth of the centro-dorsal area, and the fact that it appears and disappears without closing in *Argonauta* and *Octopus*, was demonstrated by E. Ray Lankester.
homologous with the true shell in other cases; it is a structure sui generis secreted by the expanded arms of the dorsal pair which are closely applied to it on either side (fig. 22).

Head, Foot, Mantle and Mantle-cavity.—If we now compare the fore-foot of the Dibranchiata with that of Nautilus, we find in the first place a more simple arrangement of its lobes, which are either four or five pairs of tapering processes (called "arms"), arranged in a series around the buccal cone, and a substitution of suckers for tentacles on the surface of these lobes (figs. 15 and 24). The most dorsally placed pair of arms, corresponding to the hood of Nautilus, are in reality the most anterior, and are termed the first pair. In the Octopoda there are four pairs of these arms, (fig. 38), in t, Decapoda five pairs, of which the fourth is greatly elongated (figs. 15, 16). In Sepia, Sepiola and Rossia, each of these long arms is very ramosus, in a pouch beside the head, and is only exerted for the purpose of prehension. In Loligo they are completely retractile, very slightly

arms horny hooks; in other cases a hook rises from the centre of each sucker. The hooks on the long arms of Onychoteuthis are drawn in fig. 23. In various species of Ceratosoteuthis the suckers on the tentacular arms are very minute, but the bottom of the cup is covered by a number of anastomosed epithelial filaments which are used as a fishing-net. The fore-foot, with its apparatus of suckers and hooks, is in the Dibranchiate essentially a prehensile apparatus, though the whole series of arms in the Octopoda serve as swimming organs, and in many (e.g. the cuttle-fish or poulpe) the sucker-bearing surface is used as a crawling organ.

In the males of the Dibranchiate one of the arms is more or less

so in the majority of the Oligopoda, and in Rhencholeuthis they are united to form a beak-like appendage. A gradual reduction of the tentacular arms can be seen in the Decapoda, leading to their total absence in Octopoda; thus in Leachia, Chasmatotethis and others these arms are reduced to mere stumps. In some Chiroteuthidae and Cerebratidae the ordinary or sessile arms, especially the dorsal pairs, are reduced. In the Octopoda they are not unfrequently connected by a web, and form an efficient swimming-bell, e.g. in Cirrhotethidae and Amphiradiate. The suckers are placed on the dorsal surface of the arms, and may be in one, two or four rows, and very numerous. In place of suckers in some genera, e.g. Versanya, we find on certain arms or parts of the

a, Neck; b, Eye; c, the eight short arms; d, Long prehensile arms, the clavate extremities of which are provided with suckers at e, and with a double row of hooks beyond at f. The temporary conjunction of the arms by means of the suckers enables them to act in combination.

modified in connexion with the reproductive function, and is called the "hectocotylized arm." This name is derived from the condition assumed by the arm in those cases in which its modification is carried out to the greatest extent. These cases are those of the Octopods Argonauta argo and Ocythoe calamita (fig. 24). In the males of these the third arm (on the left side in Argonauta, on the right side in Ocythoe) is found before the breeding season to be represented by a globular sac of integument. This sac bursts, and from it issues an arm larger than its neighbours, having a small sac at its extremity in Ocythoe (fig. 24, a), from which subsequently a long filaments issues. Before copulation the male charges this arm with the spermatophores or packets of spermatozoa removed from its generative orifice beneath the mantle-skirt, and during coitus the arm becomes detached and is left adhering to the female by means of its suckers. A new arm is formed at the cicatrix before the next breeding season. The female, being much larger than the male, swims away with the detached arm lodged beneath her mantle-skin. There, in a way which is not understood, the fertilization of the eggs

is effected. Specimens of the female *Ocythoe* with the detached arm adherent were examined by Cuvier, who mistook the arm for a parasitic worm and gave it the name *Hectocotylus*. Accordingly, the corresponding modified arms of other Cephalopods are said to be hectocotylized. J. S. Steenstrup has determined the hectocotylized condition of one or other of the arms in a number of male Dibranchs as follows:—in all, excepting *Argonauta* and *Ocythoe* and *Tremoctopus*, the modification of the arm is slight, consisting in a small enlargement of part or the whole of the arm, and the obliteration of some of its suckers; in *Octopus* and *Eledone* the third right arm is hectocotylized; in *Rissa* and *Sepiola* the fourth left arm is hectocotylized along its whole length, and the fourth right arm also in the middle only; in *Sepia* the fourth left arm is modified at the apodome; in *Loligopsis b. arcticus*, the same also at its apex; in *Lolitures*, the same along its whole length; in *Ommastrephes*, *Oxytoteuthis* and *Loligopsis* no hectocotylized arm has hitherto been observed. Thus, speaking generally, it is only the male and pair of short arms (the hectocotylized) in Decapoda, of the third pair in the Octopoda. In the pallial cavity are situated one pair of gills in the Dibranchiata (fig. 25), attached

---

**Luminous Organs.**—In certain Oígopoda living in deep water, e.g. *Histiotoeuthis*, *Calliteuthis*, *Histiotops*, *Pterogyoteuthis*, the surface of the skin bears photogenic organs directed towards the oral extremity. Anatomically these consist of a deeper photogenic layer of the tentacular arm at the aboral extremity where they remain in *Spirula* (fig. 18). In most other Oígopoda they are terminal, but more dorsal than ventral, e.g. *Loligopsis* (fig. 16), and there may be two on each side, as in *Grimalditeuthis*. In other cases, e.g. *Loligobatis*, they occur even within the mantle-cavity.

**Fins.**—In the majority of the Decapoda and in the *Cirrhosteuthidae*, the mantle is produced into lateral symmetrical expansions which have a furrowed surface and a lateral extremity at the aboral extremity where they remain in *Spirula* (fig. 18). In most other Oígopoda they are terminal, but more dorsal than ventral, e.g. *Loligopsis* (fig. 16), and there may be two on each side, as in *Grimalditeuthis*. In other cases they extend laterally along a greater length of the body, as in *Inebructyphax* (fig. 16). In *Cyone* they have a superficial resemblance to the fins of fishes, consisting of a thin membrane supported by a series of muscular rods.

**Chromatophores.**—These are characteristic of the Dibranchiata, apparently absent in *Nautilus*. They are originally single cells of ectodermic origin which sink below the epidermis and become conflated with radiating muscular fibres. The cells are single but multinuclear. Different cells contain pigments of different colours, yellow, brown, red or green in constant tremulous movements; under the influence of nervous excitement the cells are suddenly expanded or contracted, producing blurs of colour and paling. By reflex actions the pigment of the divergent stimulus acts upon the eyes as in fishes, the chromatophores assume a condition which approximates the colour of the animal to that of the surrounding objects.

CEPHALOPODA

The afferent branchial vessels (branches of the vena cava) enter the pallial cavity, one on each side of the rectum, except in certain Octopoda (Enoploteuthis, Cranchia, Leachia) and in the Octopoda, in which visceral organs are absent. The latter fact is related to the habit of the majority of the Octopoda of guarding or "incubating" their eggs, which have little protective covering. In other cases the eggs are surrounded by a tough gelatious elastic material secreted by the renal glands. The vas deferens is at first narrow and convoluted, then dilates into a vesicula seminalis at the end of which is a glandular diverticulum called the prostate. By the vesicula and the prostate the spermatophores are formed. These have a structure similar to that of Nautilus, and in the nol. Its (probably) olfactory branches.

Nervous System and Sense-Organs.—The figures (30, 31, 32) representing the nerve-centres of Octopus serve to exhibit the disposition

of these parts in the Dibranchiata. The ganglia are more distinctly swollen than in Nautilus. In Octopus an infra-buccal ganglion-pair is present, corresponding to the buccal ganglion-pair of Gastropoda. In Decapoda a supra-buccal ganglion-pair connected with these is also developed. Instead of the numerous radiating pallial nerves of Nautilus, we have in the Dibranchiata on each side (right and left) a large pleural nerve passing from the pleural portion of the pleuro-visceral ganglion to the mantle, where it enlarges to form the stellate ganglion. From each stellate ganglion the pleural nerves radiate to supply the powerful muscles of the mantle-skirt. The two stellate ganglia are connected, except in Sepiola, by a transverse supra-oesophageal commissure, which represents the pallial cords united by a commissure above the intestine in Amphiurea. The nerves from the visceral portion of the pleuro-visceral ganglion have the same course as in Nautilus, but no oesophageal papilla is present. An enteric nervous system is richly developed in the Dibranchiata, connected with the somatic nerves through the buccal ganglia, as in the Arthropoda through the stomato-gastric ganglia, and anastomosing with deep branches of the visceral nerves of the visco-pleural ganglion-pair.

It has been especially described by A. Hancock in Ommatostripes. Upon the stomach it forms a single large and readily detected gastric ganglion.

In the Dibranchiata division of the Cephalopoda the greatest elaboration of the dioptic apparatus of the eye is attained, so that we have in this class the extremes of the two lines of development of the Molluscan eye, those two lines being the puncetigerous and the lentigerous. The structure of the Dibranchiate eye is shown in fig. 14, C, and in fig. 33, and its development in figs. 34 and 35. The open sac which forms the retina of the young Dibranchiate closes up, and constitutes the posterior chamber of the eye, or primitive optic vesicle (fig. 37, A, p). The lens forms as a structureless secretory mass of both the internal and external surfaces of the front wall of the optic vesicle (fig. 37, B, I). The integument around the primitive optic vesicle which has sunk below the surface now rises up and forms first nearest the axis of the eye the iris folds (if in B, fig. 37; ik in fig. 33; Ir in fig. 14), and then secondly an outer circular fold grows up like a wall and completely closes over the iridial folds and the axis of the primitive vesicle (fig. 33, C). This covering is transparent, and is the cornea. In the oceanic Decapoda the cornea does not completely close, but leaves a central aperture traversed by the optic axis. These forms are termed pigmented by C. d'Orbigny, whilst the Decapoda with closed cornea are termed Myopsidae. In the Octopoda the cornea is closed, and there is yet another fold thrown over the eye. The skin surrounding the cornea presents a free circular margin, and can be drawn over the surface of the cornea by a sphincter muscle. It thus acts as an adjustable diaphragm, exactly similar in movement to the iris of Vertebrata. Sepia and allied Decapods have a horizontal lower eyelid, that is to say, only one-half of the sphincter-like fold of the pedial ganglion is inclosure of the eye. The stacocytes are situated ventrally between the pedial and visceral ganglia, and are entirely enclosed in the cranial cartilage. The cavity of each is continued into a small blind process which is the remnant of the embryonic connexion of the vesicle with the external surface. The sensory epithelium is at the anterior end of the vesicle forming the macula acustica, and in the cavity is a single otoïd, partly calcareous and partly organic, in Eledone, in which it is entirely organic. The nerve arises from the cerebral ganglion on each side and passes through the pedal ganglion.

There is no bran- chial osphradium in the Dibranchiata corresponding to that of Nautilus, but the olfactory organ or rhinophore near the eye is present. In Sepia and the majority of the Dibranchiata it is a simple pit, in some of the Oigopsida it is a projection which may be stalked.

Reproduction and Development. — The modification of one or a pair of the anterior appendages of the male for purposes of copulation has already been described. In many genera the sexes differ in another characters also. As a rule the males are more slender or smaller than the females. The maximum degree of sexual dimorphism occurs in Argonauta among the Octopoda; in this genus the female may be fifteen times as large as the male, and the peculiar modification of the dorsal arms for the reception of the shell occurs in the female only, no shell being formed in the male. In most cases the females are much more numerous than the male, but the opposite relation appears to exist in those Octopoda in which the hectocotylus is autotomous, for as many as four hectocotyls have been found in the pallial cavity of a single female. When the hectocotylus is not detached it is usually inserted into the pallial cavity of the female as described in other cephalopods or near the aperture of the oviduct, but in Sepia and Loligo they are merely deposited on the ventral lobes of the buccal membrane.

The eggs are laid shortly after copulation. In the Octopoda and in Sepia and Loligo the egg, forming the egg-case, continues into a long stalk by which it is attached with several others in a cluster. In Argonauta the eggs are carried by the female in the cavity of the shell. In Loligo the eggs are very numerous, and are enclosed in cylindrical transparent gelatinous strings united at one end into a cluster.

The Cephalopoda appear to be the only Invertebrates in which the egg is mesoblastic and telolecithal like that of Vertebrata. This is the result of the reduction of the vitelline membrane, the latter assumes in relation to the blastoderm. In all other Molluscas the segmentation is complete though in some cases very unequal. In the egg of Loligo, which has been chiefly studied (fig. 35), the protoplasmic pole is at the narrower end of the egg, and segmentation is restricted to this end, forming a layer of ectoderm cells. From one part of the periphery of the ectoderm proliferation of cells takes place and gives rise to a layer of scattered nuclei over the whole surface of the shell. The region of proliferation marks the anal side of the ectoderm, and this, on the egg has a separate epidermal membrane. This process must be regarded as equivalent to the first stage of invagination, the yollic being surrounded by hypoblast cells or their nuclei. Later on the same anal edge of the ectoderm for another collarette layer, the endoderm proper, which forms a continuous sheet below the ectoderm.

The mesoderm also originates at the anal side of the ectoderm and extends in two bands right and left between ectoderm and endoderm. When the hypoblast becomes thus established, a little vesicle is formed upon and open to the yolk is formed from the endoderm, and this vesicle ultimately gives rise to the stomach, the two lobes of the liver and the intestine. The buccal mass and oesophagus arise from a stoma-like invagination, and the anus is formed from a short procto-deal invagination.

The external changes of form are as follows:—The mantle is the middle of the embryonic area, and in its centre is the shell-gland, which forms the base of the embryonic column. In the young Mollusca, its borders grow inwards and approach each other to form the shell-sac. E. Ray Lankester showed that in Argonauta and other Octopods the shell-sac disappears before it is closed up, but in other forms such as Sepiola it closes completely and the shell develops within it. The lateral and posterior borders of the embryo form the foot, and these borders grow out into ten or eight lobes which become the arms, and which at first, as seen in fig. 35 (8), are entirely posterior to the mouth. Development actually shows the anterior arms gradually growing round the mouth and uniting in front of it.

Letters in (3) to (9): a, lateral fins of the mantle; b, mantle-skirt; e, supra-ocular invagination to form the "white body"; d, the eye; e, the mouth; f, the five paired processes of the fore-foot; k, dotted line showing internal area occupied by yolk (food-matter of the egg); k, first rudiment of the epipodia (paired ridges which unite to form the siphon or funnel); k, sac of the radula and lingual ribbon; m, stomach; n, rudiments of the gills (paired ctenidia); o, the otocysts—a pair of invaginations of the surface of the epipodia; p, the optic ganglion; q, the distal portion of the ridges which form the siphon, k being the basal portion of the same structure; r, the viscid-like rudiment of the intestine formed independently of the parts connected with the mouth, s, k, m, and without invagination; t, rudiment of the salivary gland; y in (7), the shell-sac at an earlier stage open (see fig. 36), now closed up; w, the open shell-sac formed by an uprising ring-like growth of the centro-dorsal area; w in (5), the mantle-skirt commencing to be raised up around the area of the shell-sac. In (7) m points to the middle cellular layer of the embryo p to the outer layer, and h to the deep layer of fusiform cells which separates everywhere the embryo from the yolk or food-matter lying within it.

Between the mantle and the foot are two ridges which form the funnel, and their position shows them to be the epipodia. The otocysts and eyes are formed as invaginations of ectoderm, the former behind the eyes, at the sides of the funnel. All the nerve-centres, cerebral, visceral, pedal and optic, are formed as proliferations of the ectoderm. At the sides of the optic ganglia a pair of ectodermal invaginations are formed, which in the adult become the white bodies of the eyes, surrounding the optic ganglion. These are vestiges of lateral cerebral lobes which degenerate in the course of development.

The coelomic cavity appears as a symmetrical pair of spaces in the mesoderm, right and left of the intestine, and from it grow out the genital ducts and the renal organs. The gonad develops from the wall of the coelom.

Physiology and Classification.—The order is divided into two suborders, Decapoda and Octopoda, by the presence or absence of the tentacular arms. The Decapoda are more adapted to swimming than the Octopoda, the body being usually provided with fins. In the former also there is externally an internal shell or cephalic cone in size, often calcified, while in the Octopoda only the merest vestiges of a shell remain. There can be no doubt that the Octopoda were derived from the Decapoda, although from the absence of skeletal structures the fossil remains of Octopods are almost entirely unknown. Palaeo-ocysts, however, occurs in the Cretaceous, while shells of Argonauta do not appear before the Pliocene. The Decapoda are abundantly represented in the Secondary formations by the Belemnitidae, whose shell (fig. 19) consists of a straight conical phragma-sac covered posteriorly by a very thick rostrum, and produced anteriorly into a thin long prostracum which is only occasionally preserved. In certain cases remains of the arms provided with hooks, and of the ink-sac, have been recognized. The shell appears first in the Upper Trias, attain their maximum development in the Jurassic rocks, and are not continued into the Tertiary period, though represented in the Eocene by a few allied forms.
CEPHALOPODA

Suborder 1. Decapoda.—Four pairs of ordinary non-retractile arms which are shorter than the body, and one pair of tentacular arms, situated between the third and fourth normal arms on each side and retractile within special pouches. Suckers pedunculated and provided with horny rings on the tentacular arms confined usually to the distal extremities. Usually a well-developed internal shell, and lateral fins on the edges of the body. Heart in a coelomic cavity; nidamental glands usually present.

Tribe 1. Oligopoda.—A wide aperture in the door. Two oviducts in the female. In fossil genera and Spirula, shell has a multilocular phragmocone with a siphuncle; initial chamber globular and larger than the second chamber. The most ancient forms characterized by the small size of the rostrum and prostracum, and lar

A. Pinnoctopus cordiformis, Quoy and Gaim (from New Zealand).
B. Tremoctopus violaceus, Ver. (from the Mediterranean).
C. Ctenopoma brachile, Owen (from the Atlantic Ocean; one of the Decapoda).
D. Ctenoctopus Malleri, Esch. (from the Greenland coast).
E. Cephalopods, two fins on each side, no tentacular arms.

Tribe 2. *Myopsida.*—No aperture in the cone. Left oviduct only developed in female. Internal shell without a distinct phragmocone, calcified or simply chitinous.

Fam. 2. Sepiidae. Body short, rounded at the aboral end; fins rounded, inserted in middle of body-length; shell chitinous, small or absent. Sepiola, head united to mantle dorsally, British. Rossia, head not united to mantle, British. Stoloteuthis and Inesioteuthis, without shell. Heteroteuthis. Euprymna.

Fam. 3. Idiosepiidae. Body elongated, with rudimentary terminal fins; internal shell almost lost. Idiosepius, 1-5 cm. long, Indian Ocean.

Fam. 4. Sepiadariidae. Body short; mantle united to head dorsally; no shell. Sepiadarium, Pacific Ocean. Sepioleidae, Australian.

Fam. 5. Loliginidae. Body elongated and conical; fins extending forward beyond the middle of body-length; shell chitinous, well developed. Loligo, fins triangular, aboral, British. Sepiotethis, fins rounded, extending along whole of body-length. Lolobus, Loliguncula. The following genera, known only by their gladius and ink-sac, have been placed near Loligo:—Teuthopis, Beloteuthis and Genoteuthis, Lisas; Physlolothys, Cretaceous; Plestoteuthis, Jurassic and Cretaceous.

Suborder 2. Octopoda.—Only four pairs of arms, all similar and longer than the body. Body short and rounded aborally.

Fam. 1. Amphioteidae. Arms united by membrane; funnel attached to mantle, dividing the pallial aperture into two. Amphioteuthis, pelagic.

Fam. 2. Allopriopidae. All arms united by membrane; mantle joined to head by dorsal band and two lateral commissures. Allopriopus, pelagic.

Fam. 3. Otopriopidae. Arms long and equal, without membrane; body chitinous or not autotomous. Octopus, two rows of suckers on each arm, British. Eledone, single row of suckers on each arm. Scaweunus, Pinnucotous. Cistopus, Japetela.

Fam. 4. Philectinae. Hectocotylus autotomous; arms unequal in size; aquiferous pores on head and funnel. Tremoctopus, two dorsal pairs of arms united by membrane. Ocytheil, without interbrachial membrane.

Fam. 5. Argonautidae. Hectocotylus autotomous; no interbrachial membrane; extremities of dorsal arms in female expanded and secreting a shell; males very small, without shell. Argonauta.

CEPHUS, in Greek mythology, the father of Andromeda (q.v.); in astronomy, a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.). Ptolemy catalogued 13 stars in this constellation, Typhon 11, and Hevelius 51. The most interesting star in it is α Cephei, a remarkable double star, the brighter component of which is a short period variable (5.37 days), with a range in magnitude of 3.7 to 4.9; it is also a spectroscopic binary.

CEPHISODOTUS, the name of the father and of the son of Praxiteles, both sculptors like himself. The former must have flourished about 400 B.C. A noted work of his was Peace bearing the infant Wealth, of which a copy exists at Munich. Peace is a Madonna-like figure of a somewhat conservative type; the child Wealth is less successful. Cephisodotus also made, like his son, a figure of Hermes carrying the child Dionysus, unless indeed ancient critics have made two works of one. He made certain statues for the city of Megalopolis, founded in 370 B.C. Of the work of the younger Cephisodotus, his grandson, we have no remains; he was a prolific sculptor of the latter part of the 4th century B.C., especially noted for portraits, of Menander, of the orator Lycurgus, and others (see J. Overbeck, Antike Schriften, p. 255).

CERAM, an island of the Dutch East Indies, in the Molucca group, lying about 5° S., and between 127° 45’ and 136° E. Its length is a little over 200 m., its greatest breadth about 50 m., and its area, including neighbouring islands, 6621 sq. m. It consists of two parts, Great Ceram and Little Ceram or Huvamohel, united by the isthmus of Taruno; and, for administrative purposes, is assigned to the residency of Ambonya, being divided into Kairatu or West Ceram, Wahai and Ambahai, the northern and the southern parts of Middle Ceram, and Waru or Eastern Ceram. No central chain of mountains stretches west and east through the island, but near the north coast hills, rising 2300 to 2800 ft., slope steeply to the shore. Near the south coast, west of the Bay of Elpaputeh, a complex mass of mountains forms a colossal pyramid, with peaks rising to nearly 5000 ft. The isthmus connecting the two parts of the island is very narrow, and has a height of only 460 to 490 ft. The chief rivers flow north and south into bays, but are navigable only for a few miles during the rainy season. The rainfall is very heavy, amounting to 12 ft. (mean annual) on the south coast. On the north coast the bays of Sawu and Waru are accessible for small vessels. The geological structure, consisting chiefly of eruptive rocks and crystalline limestone, is similar to that of northern Ambonya. In the eastern section the prevailing rock is limestone chalk, similar to that of Buru. Several hot springs occur, and earthquakes are not infrequent. About 4000 persons

General Evolution of Pottery.—The primitive races of mankind, whether of remote ages or of to-day, took porfice such clay as they found on the surface of the ground, or by some river-bed, and, without any rudimentary preparation of spreading it out on a stone slab if necessary and picking out any rocky fragments of appreciable size, then beating it with the hands, with stones or boards, or treating it with the feet to render it fairly uniform in consisteny, proceeded to fashion it into such shapes as need or fancy dictated. Fired in an open fire, or in the most rudimentary form of potter's kiln, such pottery may be buff, drah, brown or red — and those from imperfect firing become smoked, grey or black. How many generations of men, of any race, handed on their painfully acquired bits of knowledge before this earliest stage was passed, we can never know; but here and there, where the circumstances were favourable or the race was quick of observation, we can trace in the work of prehistoric man in many countries a gradually advancing skill based on increased technical knowledge. For ages tools and methods remained of the simplest — the fingers for shaping or building up vessels, a piece of mat or basket-work for giving initial support to a more ambitious vase, — until some original genius of the tribe finds that by starting to build up his pot on the flattened side of a boulder he can turn his support so as to bring every part in succession under his hand, and lo! the potter's wheel is invented — not brought down from heaven by one of the gods to a favoured race, as the myths of all the older civilizations or barbarisms, Egyptian, Chaldean, Greek, Scythian, and Chinese have failed, but born from the brain and hand of man struggling to fulfil his allotted task.

Matthews in his writer on the history of pottery seemed to imagine that the very rudest pottery must have been the invention of Egyptian, Chinese or some other distinct race from which the knowledge radiated to all the other races of the prehistoric world. No conception could be more erroneous. Since the middle of the 19th century research has established beyond doubt that wherever clay was found men became potters of a sort, just as they became hunters, carpenters, smiths, &c., by sheer force of need and slowly-gathered tradition. The not yet explored world that Egypt or Assyria was the special cradle of this art, and that the pottery of the Greeks and Romans directly descended from such a parent stock, cannot survive in view of the incontestable evidence that pottery was made by the prehistoric peoples of what we now call Greece, Italy, Spain and other countries, long before they were aware that any other peoples lived on the earth than themselves.

For centuries this simple hand-made pottery was hardened by drying in the sun, so that it would serve for the storage of dried grain, &c., but the increasing use of fire would soon bring out the amazing fact that a baked clay vessel became as hard as stone. Then, too, came the knowledge that even in one district all the clays did not fire to the same colour, and colour decoration arose, in a rude daubing or smearing of some clay or earth (a rudie or bole perhaps), which was found to give a bright red or buff colour on vessels shaped in a duller-coloured clay — most precious of all were little deposits of white clay which kept their purity unsullied through the fire, — and by these primitive means the races of the dawn made their wares. On this substructure all the pottery of the last four thousand years has been built, for behind all Egyptian, Greek or Chinese pottery we find the same primitive foundations.

We now reach the beginnings of recorded history, and as the great nations of the past emerge from the shadows they each develop the potter's art in an individual way. The Egyptians evolve schemes of glowing colour — brilliant glazes fired on objects, shaped in sand held together with a little clay, or actually carved from rocks or stones; the Greeks produce their marvells of some example of ancient pottery — was it made in the district where it was found, or had it been imported from some other centre? When we possess a sufficient body of analytical data obtained by the use of one general chemical method, an analysis of a fragment will frequently enable such a question to be answered, where now all is doubt and speculation. But the analytical results published hitherto are often not worth the paper they are printed on for such a purpose, the older methods of silicate analysis being only approximate.

1 The archaeologist is frequently puzzled as to the place of origin,
of plastic form, and then, excited by their growing skill in metal work, turn the plastic clay into imitations of metal forms. These nations are overthrown, and the Romans spread some knowledge—only a tincture, it must be confessed—over all the lands they hold in fee; and from the Euphrates to the Atlantic, from Egypt to the Wall of Hadrian, they set eight potters’ firms that have never since been extinguished. The Roman empire falls, and over Europe its pottery is forgotten along with its greater achievements; yet still pottery-making goes on in a very simple way, to be slowly revived and modified once more by the communities of monks, who, in later centuries, replace the Roman legions as the great civilizing influence in Europe. Meanwhile Egypt and the nearer East continued, in a debased form, the splendours of their glorious past, and glazed and painted pottery was still made by traditional methods. What part the Byzantine civilization and the Persians played during this obscure time, we are only just beginning to realize; but we now know that many interesting kinds of decorated pottery were made at Old Cairo, at Alexandria, at Damascus, in Syria, Anatolia and elsewhere (on which the later Moslem potters founded their glorious works), at a time when all over Europe crocks of simple red or drab clay, covered only with green and yellow lead-gazes, were the sole evidence of the potter’s skill. What the Arab conquests destroyed, and what their breath quickened into life, we can only guess; but the fact is indisputable that with the Mahomedan conquests there came a time when the potter’s art of the East reached its highest expression, and when methods and knowledge hitherto confined to Egypt, Syria and Persia were spread from Spain and the south of France to India—even, it may be, into China.

Meantime, in the farther East, the Chinese—the greatest race of potters the world has ever seen—were quietly gathering strength, until from their glazed, hard-fired pottery there emerged the marvellous, white translucent porcelain, one of the wonders of the medieval world.

With the dawn of the 15th century of our era, the state of affairs was practically this:—In European countries proper we find rudely fashioned and decorated wares in which we can trace the slow development of a native craft from the superposition of Roman methods on the primitive work of the peoples. The vessels were mostly intended for use and not for show; were clumsily fashioned of any local clay, and if glazed at all then only with coarse lead-gazes, coloured yellow or green; in no case above the level of workmanship of the travelling brick- or tile-maker. The finest expression of this native style is to be found in the Gothic tile pavements of France, Germany and England, where all the colours are due to the clays and there is no approach to painting. In the Moslem countries—including the greater part of Spain and Sicily, Egypt and the nearer East, perhaps even to the very centre of Asia—pottery was being made either of whitish clay and sand, or of a light reddish clay coated with a white facing of fine clay or of tin-enamel, on which splendid decorative patterns in vivid pigments or brilliant iridescent lustres were painted.

As early as the 12th century of our era this superior artistic pottery of the Moslem nations had already attracted the notice of Europeans as an article of luxury for the wealthy; and we may well believe the traditional accounts that Saracen potters were brought into Italy, France and Burgundy to introduce the practice of their art, while Italian potters certainly penetrated into the workshops of eastern Spain and elsewhere, and gathered new ideas. In Italy certainly, and in the south of France probably, efforts were continuously in progress to improve the native wares by coating the vessels with a white “slip” and drawing on them rude, painted patterns in green, yellow and purplish black. The increasing intercourse with Spain, in war and peace, also introduced the use of tin-enamel after the fashion of the famous Hispano-Moresque wares, and by the end of the 14th century a knowledge of tin-enamel was widespread in Italy and paved the way to the glorious painted majolica of the 15th and 16th centuries. From Italy and Spain, France and Holland, Germany, and finally, though much later, England learnt this art, and the tin-enamed pottery of middle and northern Europe, so largely made during the 17th and 18th centuries, was the direct offspring of the motives of the Italian Renaissance.

During the 15th and 16th centuries Chinese porcelain also began to find its way into Europe, and by the whiteness of its substance and its marvellous translucence excited the attention of the Italian majolists and alchemists. The first European imitation of this famous oriental porcelain of which we have indubitable record was made at Florence (1575–1585) by alchemists or potters working under the patronage, and, it is said, with the active collaboration of Francesco de’ Medici. This Florentine porcelain was the first of those distinctively European wares, made in avowed imitation of the Chinese, which form a connecting link between pottery and glass, for they may be considered either as pottery rendered translucent or as glass rendered opaque by shaping and firing a mixture containing a large percentage of glass with a very little clay. After the cessation of the Florentine experiments we know no European porcelain for nearly a century, though the importation of Chinese porcelain had largely increased owing to the activity of the various “India” companies. The next European porcelain, made like the Florentine of glass and clay, was that of Rouen (1673) and St Cloud (1696); and during the 18th century artificial glassy porcelain was made in France and England; but then experiments were worked upon, and the first porcelain made in Europe from materials similar to the Chinese was produced at Meissen by Böttger (1710–1712). During the 18th century not only was there a very large trade in imported Chinese and Japanese porcelain, but there was a great development of porcelain manufacture in Europe; and in every country factories were established, generally under royal or princely patronage, for the manufacture of artificial porcelain like the French, or genuine porcelain like the German. The English made a departure in the introduction of a porcelain distinct from either, through adding calcined ox-bones to the other ingredients; and this English bone-porcelain—a well-marked species—is now largely made in America, France, Germany and Sweden as well as in England.

By the end of the 18th century the risks and losses attendant on the manufacture of the French glassy porcelain had caused its abandonment, and a porcelain made from natural materials like the Chinese has since been generally made on the continent of Europe.

The older tin-enamed wares—derived from the Hispano-Moresque and the Italian majolica—so largely made in France, Holland, Germany and elsewhere during the 17th and 18th centuries, met with a fate analogous to that of the French porcelain. Tin-enamed earthenware is always a brittle substance, soon damaged in regular use; so that, when, in the middle of the 18th century, the English potter first appeared as a serious competitor with a fine white earthenware of superior durability and precision of manufacture, the old painted faience gradually disappeared between the upper millstone of European porcelain and the nether millstone of English earthenware.

The 19th century witnessed a great and steady growth in the output of porcelain and pottery of all kinds in Europe and the United States. Mechanical methods were largely called in to supplement or replace what had hitherto remained almost pure handicraft. The English methods of preparing and mixing the materials of the body and glaze, and the English device of replac- ing painted decoration by machine printing, to a large extent carried the day, with a great gain to the mechanical aspects of the process.
work and in many cases with an entire extinction of its artistic spirit. Even the hand-work that still remained was largely affected by the growing dominance of machinery, and the painting, glazing and decoration of pottery and porcelain, in the first half of the 19th century, became everywhere mechanical and hackneyed. During the latter half of the 19th century another influence was fortunately at work. Side by side with the increasing mechanical perfection of the great bulk of modern pottery throwing grew up a school of innovators and experimentalists, who revived many of the older decorative methods that had fallen into oblivion and produced fresh and original work, in certain directions even beyond the achievements of the past. The 20th century opened with a wider outlook among the potters of Europe and America. In every country men were striving once again to bring back to their world-old craft something of artistic taste and skill.

Technical Methods.—All primitive pottery, whether of ancient or of modern times, has been made by the simplest methods. The clay, dug from the earth's surface, was or is prepared by being kneaded with the hands, feet or simple mallets of stone or wood; stones and hard particles were picked out; and the mass, well tempered with water, was used without any addition. From this clay, vessels were shaped by scooping out or cutting, or by building up piece by piece and smoothing down one layer upon another or by squeezing cakes of clay on to some natural object or prepared mould or form. The potter's wheel, though very ancient, was a comparatively late invention, arrived at independently by many races of men. In its simplest form it was a heavy disk pivoted on a central point to be set going by the hand, as the workman squatted or crouched on the ground; and it may be seen to-day in India, China, or Japan, in all its primitive simplicity (see fig. 1). This form of potter's wheel was the only one known until about the Christian era, and then, in Egypt apparently, the improvement was introduced of arranging the spindle which carries the throwing-wheel and mounting on it near the base a much larger disk which the potter could rotate with his foot, and so have both hands free for the manipulation of the clay (fig. 2). Nor further advance seems to have been made before the 17th century, when the wheel was spun by means of a cord worked over a pulley; and though a steam-driven wheel was introduced in the middle of the 19th century, this form remains the best for the production of fine pottery.

A prevalent misconception with regard to the potter's wheel needs correction. For anything beyond very simple shapes it is impossible to carry the work to completion on the wheel at one operation as is generally imagined. All that the potter can do while the clay is soft enough to be thinned by the wheel is to get a rough shape in thickness. This operation completed, the piece is removed from the wheel and set aside to dry. When it is about leather-hard, it may be re-centred carefully on the wheel (the old practice), or placed in a horizontal lathe (since 16th century) and turned down to the exact shape and polished to an even, smooth surface. The Greek vase-makers were already adept in what is often reckoned a modern, detestable practice. Many Greek vases have obviously been thrown in separate sections, and when these had contracted and shrunk sufficiently they were luted together with slip, and the final vase-shape was smoothed and turned down on the wheel, and even polished to as high a degree of mechanical finish as the modern potter ever attains. So too with the Chinese many of their forms have been made in two or three portions, subsequently joined together and finished on the outside as one piece. Indeed, it is remarkable how the Greeks and Chinese had discovered for themselves many devices of this kind which are generally held up to opprobrium as the debased methods of a mechanical age.

Always it should be borne in mind that the shaping of pottery by pressing "cakes of clay into moulds is much older than the potter's wheel, and has always been the method of making shapes other than those in the round. The modern method of "casting" pottery by pouring slip, a fluid mixture of clay and water, into absorbent moulds seems to have originated in England about the middle of the 18th century; and this too is a genuine potter's method which does not merit the disapproval with which it has been generally regarded by writers on the potter's art.

In all ages the work of the "thrower" or "presser" has been largely supplemented by the modeller, who alters the shape, and applies to it handles, spouts or modelled accessories at will. The firing of pottery has become in modern times such a specialized branch of the manufacture that the student can only be referred here to the technological works mentioned in the bibliography at the end of this article. It is, however, necessary that we should briefly describe the earlier forms of potters' kilns used by the nations whose pottery counts among the treasures of the collector and the antiquary. Here again we now know that the primitive types of kiln used by the potters of ancient Egypt or Greece have not vanished from the earth; it is only in the civilized countries of the modern world that they have been replaced by improved and perfected devices. The potters of the North-West Provinces of India use to-day a kiln practically identical with that depicted in severest silhouette on the rock-tombs of Thebes; and the method used is no longer that of the early kiln which was made under their sway, for remains of Roman kilns have been found in many countries (see fig. 4). With the end of Roman dominance we have a clear evidence that their technical methods fell into disuse, and that the northern European potter of the period from the 6th to the 12th century had to build up his methods afresh, and improved kilns were invented. The general type of medieval potter's kiln is illustrated for us in the manuscript of an Italian potter of the 16th century, now in the library of the Victoria and Albert Museum (fig. 5). Kilns of a different type, horizontal reverberatory kilns, were used for making the hard-fired pottery of

---

Europe (Rhenish stoneware, &c.), as well as for Chinese porcelain and the earliest German porcelains. With the organization of pottery as a factory industry in the 18th century, improved kilns were introduced, and the type of kiln now so largely used in civilized countries is practically the same as that of ancient times. Very few kilns are over 22 ft. in diameter and of similar height, capable, therefore, of containing at one firing a quantity of pottery that would have formed the output of a medieval potter for a year. Every device that can be thought of for the better utilization of heat and its even distribution throughout the kiln or oven has been experimented with; and, though the results have been most successful from the point of view of the potter, even the most recent coal-fired overglaze enamel kilns vary but slightly in type from those of the earliest available heat being relatively small to the fuel consumption. Gas-fired kilns and ovens are now being used or experimented with in every country, and their perfection, which cannot be far distant, will, of course, be the most vital of the potter's processes both in certainty and economy.

Glazes.—We are never likely to know when glaze (i.e., a coating of fired glass) was first applied to pottery, though the present state of knowledge has led to the belief that in all probability the earliest glazed objects we possess are those of ancient Egypt, though the practice may have been originated independently wherever a knowledge of the elements of glass-making had spread, as the early glass wares of Egypt have certainly been fused at a temperature far below that at which a glazed surface could be produced, and that both the blackness and the bright red of the earliest Greek vessels may be accounted for by the use of glass, or rather of glass frit, in the glaze.

Many primitive races seem to have burnished their pottery after it was fired, in order to give a glossy surface; and in other cases the surface was rendered shiny and waterproof by coating it with a wax or resinous substances which were often coloured. It is possible that the blackness of some greek vessels was obtained by such a method, and that though that point is not settled, we have many types of primitive pottery, both modern and ancient, which were coated in this way. Such a coating is only a substitute for glaze in the work of peoples who do not know or have not mastered the technical secrets of true glaze. We can only consider as glazes those definite superficial layers of molten material, the composition and substance of which is varied as the various kinds of pottery, and which must never be forgotten that each kind of pottery is its best with its appropriate glaze. The earliest known glazes (Egyptian and Assyrian) were silicates of soda and lime containing very little alumina and iron. Such glasses are very uncertain in use, and can only be applied to pottery unusually rich in silica (i.e., deficient in clay). Consequently these alkaline glazes cannot be used on ordinary clay wares, and when they have been used successfully, the clay has always been coated with a surface layer of highly silicious substance (e.g., the so-called Persian, Rhodian, Syrian and Egyptian pottery of the early middle ages). The fact that glazes containing lead-oxide would adhere to ordinary pottery when alkaline glasses would not, has been long known (e.g., at a temperature of 1300° C.); they were extensively used in Egypt and the nearer East in Ptolemaic times, and it is significant that, though the Romans made singularly little use of glasses of any kind, the pottery that succeeded theirs, either in the hard-fired types or in the fine porcelain, was covered with glazes rich in lead. Throughout Europe, and over the greater part of the world, leaded glazes have been continuously used and improved for all ordinary pottery, and it is almost certain that all early Hard-fired types of ware that they have yet been successfully replaced. Chinese porcelain and all the European porcelains made by analogous methods are fired at so high a temperature that a glaze by felspathic glasses is found most suitable for them, and the clay has always been coated with a surface layer of high silica and not with a salt glaze, or a melted earth rich in oxide of iron.

Every kind of potter's clay (the mixture of clay, sand, flint, &c., from which the potter shapes his wares) has its own type of glaze, and the hard-fired types of ware that they have yet been successfully replaced. Chinese porcelain and all the European porcelains made by analogous methods are fired at so high a temperature that a glaze by felspathic glasses is found most suitable for them, and the clay has always been coated with a surface layer of high silica and not with a salt glaze, or a melted earth rich in oxide of iron.

The earliest glazed objects found in Egyptian tombs (once dignified by the name of Egyptian porcelain) are hardly to be called pottery at all, though we have no other name for them. The material is largely sand held together by a little clay and glass which cannot be fired at the highest temperature, lead glazes have always proved the most practicable. A similar clay, to which large quantities of sand are added, may be glazed by the vapours of common salt; and mixtures rich in felspath, like Chinese or European porcelain, can be fired with lead glazes, but not with felspathic ones. Naturally those species of pottery which are the hardest fired are the most durable—the glazes of hard porcelain are much more durable than lead glazes, and these in their turn than alkaline glazes.

The following are the most important alkaline glazes (e.g., Egyptian, Syrian, Persian, &c.): (1) lead glazes, the most widespread in use and the best for all ordinary purposes; (2) felspathic glazes, the glazes of hard-fired compositions; (3) porcelain, a general term for all salt glazes produced by vapours of common salt, the special glazes of German and English porcelain. Many intermediate glazes have been devised to meet special needs, but these remain the only important groups. Fuller details on this important subject must be sought in the technical works. Colours.—The primitive ideas of the most remote periods have all striven to decorate their wares with colour. The simplest, and therefore the earliest, colour decoration was carried out in natural clays and clays. The clays are so varied in composition that they fire to every shade of colour from white to grey, cream, buff, red, brown, or even to a bronze which is almost black. One clay daubed or painted upon another formed the primitive palette of the potter, especially before the invention of glass. When glaze was discovered, as in the vicinity of the sea, and the materials came from the sea, it was possible to work in the clay; other than clays, containing iron, manganese and cobalt, were gradually discovered and used. It is also surprising to note that some of the very earliest glazes were coloured glasses containing copper or silver to a much smaller extent. The finest glazes of the late Roman and Byzantine periods, and some of the most beautiful of the Persians, Syrians and Turks, were produced by the use of pure copper, the deep yet vivid blue of cobalt, the beautiful uncertain purple of manganese, and in certain districts the rich red of Armenian bole, they achieved colour schemes that have never been surpassed.

When the coating of white silicious clay was replaced by an opaque tin-enamel as in Spain, Italy, France, Holland, &c., a necessary change in the colour schemes resulted. At first only the copper-greens and cobalt-blues could be used on such a ground; the fine manganese purple turned to brown or black and the rich iron-reds to filthy shades of yellow. We cannot wonder that the Spanish-Arab potters paid more attention to their lustre decoration, of which many fine examples exist. The very first glazes that could be evolved for use on a tin-enamel ground was shown by the Italian majolists of the 13th and 16th centuries; and when the later developments of tin-enamelled pottery took place in France, Holland and Germany, the whole body of the European potters of Italian majolica crossed with Chinese porcelain. Delft, Nevers, Moustiers and Rouen may each charm us with its individuality; Nuremberg and other south German towns may show us that they too had mastered the use of tin-enamel; yet each always go back to the colour schemes of Italian majolica and of the Persian and Syrian pottery that lie behind and beyond them.

The colours already spoken of were either clay colours or what are known to us under the name of 'clay colours,' because they were painted on the pottery before the glaze was fired. The earliest glazes of the Egyptians appear not to have been glazed, but were coloured throughout their substance, and this use of colour on clay wares continued in Arabia and Persia, and, along with the painted decoration by the later Egyptian, Syrian and Persian potters. Green, yellow and brown glazes were almost the only artistic productions of the medieval European potters' kilns, and, as a result, there is a great want of variety in the decoration of Mediterranean pottery. The most extensive application of coloured glazes was, however, that made by the Chinese, who developed this type of colour decoration before they used painted patterns in underglaze colour. As early as the Sung dynasty, stone wares out of which their porcelain arose, were decorated in this way, and the beauty of many of the early Sung coloured glazes has never been surpassed. We have seen exceedingly refractory felspathic glazes of Chinese porcelain very few underglaze colours could be used; and the prevalence of blue and white among the early specimens of Chinese porcelains is due to the fact that cobalt was almost the only substance known to the potters of the Ming dynasty which would endure the high temperature needed to melt their glazes. Consequently the Chinese were driven to invent the method of painting in coloured fusible glasses on the already fired glaze. They adopted for this purpose the coloured enamels used on metal; hence the common

CERAMICS

The use of the potter's wheel is unknown, while it is remarkable how beautifully true and finely-fashioned much primitive pottery is. The primitive painted and black wares discovered by Flinders Petrie in Egypt, and the somewhat similar vessels of prehistoric date from Spain, are remarkable instances of this. Some primitive races leave their pottery without decoration, especially when they have a fine red-burning clay to work in, but, generally speaking, primitive pottery of every race and time is elaborately decorated, but only with the simplest patterns. Such decorations consist of lines, dots or lunette-shaped depressions arranged in crosses, chevrons, zigzags or all-over repeated pattern. All this ornament is scratched or impressed into the clay before it is fired. Simplest of all is, perhaps, the pattern which has so obviously been produced by pressing a twisted thong round the neck or bowl of a vase; though the thong may have been used in the first instance merely to serve as a support while the vessel was dried. At a later stage the ornament is generally obtained by scratching with a tool, by pressing the end of a hollow stick into the clay to form rows of circles, by using a stick cut at the end into the shape of a half-moon, or other equally simple decorative device. In certain tropical countries this rudimentary pottery is used in the form of such everyday utensils as are used when merely dried in the sun, but in all northern and temperate countries it must have been fired, probably in the most imperfect way, in an open fire or in such a kiln as could be formed by sinking a hole into the ground and erecting round it a screen of stones. How imperfect the firing was is shown by the ashen-grey colour due to smoke. In those countries where the ware has been more perfectly fired the pieces naturally become buff, drab, brown or red.

The primitive vessels that have been found in the grave-mounds of England and the northern countries generally have received a number of fanciful names for which there is very little warrant except in the case of the cinerary urns. These are generally the largest vessels of this class, and as they were used to contain burnt bones there seems sufficient warrant for the supposition that they were made for this and for no other purpose.

Our knowledge of primitive pottery has been greatly improved during recent years by the labours of a number of American students connected with the United States Geological Survey, who have carefully recorded the present-day practices of those native tribes who make and use pottery in North America and Mexico; while, in the same way, Peruvian, Brazilian and other South American pottery has been as closely investigated by European observers. It should be noted that no primitive pottery reveals any trace of a knowledge of glaze, though much of it has been highly polished after firing, and in some cases a varnish has been applied which may perhaps be regarded as the earliest kind of "glazing" ever applied to pottery vessels.

LITERATURE.—On primitive pottery the following works may be specially mentioned. W. Greenwell, British Barrows (1877); Boyd-Dawkins, Early Man in Britain (1886); Mortimer, Forty Years' Exploration in British and Saxon Burial-mounds of East Yorkshire (1895); Abercromby, "The Oldest Bronze-age Ceramic Type in Britain," J. Anth. Inst., vol. xixii. (1902), 373; Guide to Antiquities of the Bronze Age (British Museum, 1904); Koenen, Gefässkunde der nordrömischen, römischen und frühchristlichen Zeit in den Rheinlandern (1895); Wosinsky, Der inkrustierte Keramik der Stein- und Bronzezeit (1904); Walters, History of Ancient Pottery (Greek and Roman) (1905); Holmes, Aboriginal Pottery of the Eastern United States (American Ethnology, Washington, 1899); also Brehm, Die anfänglichen Werkstoffe der Kultur. Heft 2; Wiener, "Dér Vérou et Bienie" (1886); Von der Steinen, Natur-Völkerz Central Brasilien (1894); Hartman, Archaeological Researches in Costa Rica (1905); Strebel, on Mexican Pottery in Publications of Museum for the South-western United States (Berkeley, 1892); Berl, Origin and History of the Indian Ceramist (1907); Füllborn, Deutsche Ost-Afrika, vol. ix. (1907); Macleur, "Kabyle Pottery," Journ. Anth. Inst. vol. xxxii. p. 245, and "Upper Egypt," ibid. xxxv. p. 20; Myers, Early Pottery Fabrics of Asia Minor (1908); Eberle, "Méthodes anciennes et actuelles sur les collections ethnographiques du Congo," tome ii (1907); Cupart, Débuts de l'art de l'ancienne Egypte (1903).

EGYPT AND WESTERN ASIA

EGYPTIAN POTTERY.—Egypt affords us the most striking instance of the development of the potter's art. As in other countries

PRIMITIVE POTTERY

We can group together that great and widely-spread class of vessels made by the primitive races of mankind, whether before the dawn of civilization or at the present day, for it is interesting to note that many modern races still make pottery by the same rude method as the Neolithic races of Europe and Asia, and with striking similarity of result. In fact, the knowledge of the methods and practices of the primitive potters of our own time furnishes the best possible guide to the methods of fabrication and ornamentation of the ancient specimens that are dug up from barrows, grave mounds, and tumuli. It is only natural that the materials and methods of such pottery are always of the simplest. The clay is used with very little preparation, and it is an unusual thing to find bits of stone, gravel, &c., embedded in the paste of such ware. The original clay, after it has been removed, it must be remarked, however, that none of the potters practised the art for long without discovering that their vessels were not so liable to crack in drying, or lose their shape in firing, if fine sand or pounded "potsheds" were mixed with the clay; and when we are dealing with the work of races that have passed beyond the Stone Age and have learned the use of metals we find this custom universal.

There are three methods of shaping which seem to be common to almost every primitive race:—

1. The scooping out of a vessel from a ball of clay.

2. The building up of a form, often on a piece of basket-work or matting, gradually raising the walls higher by applying and smoothing down successive layers of clay.

3. Coiling: in which the clay is rolled out into thin ropes, and these are coiled round and round upon each other and smoothed down with the hands and with simple tools of bone, wood or metal.
CERAMICS

pottery was made even in Neolithic times, for the Nile mud forms a fine plastic clay and sand is of course abundant. With these materials various kinds of pottery, often extremely well made and of good form, have been continuously produced for common domestic requirements, but such pottery was never glazed.

The wonderful glazes of the Egyptians were applied to a special preparation which can hardly be called pottery at all, it contained so little clay. Yet as early as the 1st Dynasty the Egyptians had learnt to shape little objects in this tender material and cover them with their wonderful turquoise glazes.

We have therefore to study the development of two independent things: (1) the ordinary pottery of common clay left without glaze; (2) the brilliant glazed faience which appears to be special to Egypt, though it may have been the groundwork for the technique of the slip-faced painted and glazed pottery of the nearer East.

We probably do not possess any specimens of the most primitive Neolithic pottery; the oldest type known to us, the black and red ware of Ballas and Nagada (1), dates from the later Neolithic age, when copper was just beginning to be used. This ware is very hard and compact and the face is highly burnished. The red colour was produced by the wash of fine red clay; the black may have been due to the loss of carbon in the process of baking, which was done, Professor Petrie suggests, by placing the pot's mouth down in the kiln, and leaving the ashes over the part which was to be burnt black. Both red and black colour go right through in every case. All-red and all-black vases are occasionally found, the red with geometrical decorations in white colour, and the black with incised decoration. The forms are usually very simple, but at the same time graceful, and the grace of form is more remarkable when it is remembered that none of this early pottery was made on the wheel. Pottery of almost similar technique was found in Crete in 1905 during the American excavations at Vasiliki near Hierapetra. The general appearance of the Cretan pottery is much the same as that of the Egyptian, and the duller red and black decoration (which here has a spotted or mottled appearance) was probably obtained in the same way, the black spots being due to the action of separate fragments of the baking material. This discovery is important in view of the probable early connexion of the Cretan and Egyptian culture-centres.

A ware, usually of thinner and harder make, and often with a brighter surface, was introduced into Egypt at a later date (XIIth Dynasty), probably by Nubian tribes who were descended from relatives of the Neolithic Egyptians. From their characteristic graves these people are called the Pan-Grave people, and their pottery is known by the same name.

Perhaps rather later in date than the early red and black wares, but by no means certainly so, the second characteristic type of primeval Egyptian pottery is a ware of buff colour with surface decorations in red. These decorations are varied in character, including ships, birds and human figures; wavy lines and geometrical designs commonly occur. The whole fact of this ware seems very un-Egyptian, and it has been compared with the decorated " Kabyle pottery " of modern times. To call the people who made this ware " Libyans " on the strength of this resemblance of their pottery to that of the modern Kabyles, six thousand years later, seems, however, rash. The prehistoric Egyptians were not Kabyles or Libyans, but Nilotes, and the peculiar decoration of their pottery, which seems so strangely barbaric, is in reality merely the most ancient handiwork of the Egyptian painter, and marks the first stage in the development of pictorial art on the banks of the Nile (2). Other types of pottery (3), in colour chiefly buff or brown, were also in use at this period; the most noticeable form is a cylindrical vase with a wavy or rope band round it just below the lip, which developed out of a necked vase with a wavy handle on either side. This cylindrical type outlived the red and black and the red buff decorated styles (which are purely Neolithic and predynastic) and continued in use in the early dynastic period, well into the Copper age. The other unglazed pottery of the first three dynasties is not very remarkable for beauty of form or colour, and is indeed of the roughest description (4), but under the IVth Dynasty we find beautiful wheel-made bowls, vases and vases-stands of a fine red polished ware (4). This fine ware continued in use at least as late as the XVIIIth Dynasty, though the forms of course differed from age to age. Under the XIIth Dynasty, and during the Middle Kingdom generally, either this or a coarser unpolished red ware was in use. The forms of this period are very characteristic (5); the vases are usually footless, and have a peculiar globular or drop-like shape—some small ones seem almost spherical. At this period the foreign " Pan-Grave " black and red pottery was also in use (see above).

The art of making a pottery consisting of a siliceous sandy body coated with a vitreous copper glaze seems to have been known unexpectedly early, possibly even as early as the period immediately preceding the 1st Dynasty (4000 B.C.). Under the XIIth Dynasty pottery made of this characteristic Egyptian faience seems to have come into general use, and it continued in use down to the days of the Romans, and is the ancestor of the glazed wares of the Arabs and their modern successors (6).

The oldest Egyptian glazed ware is found usually in the shape of beads, plaques, &c.—usually in the form of pottery vessels. The red or brown glaze was produced by a glaze, which may turn either white or green; but beads of the grey-black manganese glaze are found, and on the light blue vases of King Aha (who is probably one of the historical originals of the legendary " Mena " or Menes) in the British Museum (No. 35,810) we have the king's name traced in the manganic glaze on (or rather in) the blue-white glaze of the vase itself, for the second glaze is inlaid. This style of decoration in manganese black or purple on copper-blue continued till the end of the " New Empire " (i.e. before the XXVIIth (Saitite) Dynasty. It was not usual actually to inlay the decoration before the time of the XVIIIth Dynasty. The light blue glaze was used well into the time of the XIIth Dynasty (British Museum, No. 36,345), but was then displaced by a new tint, a brilliant turquoise blue, on which the black decoration shows up in sharper contrast than before. This blue, and a somewhat duller, greyer or greener tint was used at the time for small figures, beads and vases, as well as for the glaze of scarabs, which, however, were usually of stone-schist or steatite faience. The characteristically Egyptian technique of glazed scarabs was found up to the Roman period (No. 3666) (6), and the greenish-blue glaze was employed (on account of its softness), but a remarkably brilliant effect was obtained by glazing hard shining white quartzite with the wonderfully delicate XIIth Dynasty blue. A fragment of a statuette plinth of this beautiful material was obtained during the excavation of the XIIth Dynasty temple at Deir el-Bahri in 1904 (British Museum, No. 40,948). Vessels of diorite or other hard stones are also found coated with the blue glaze. A good specimen of the finest XIIth Dynasty blue-glazed faience is the small vase of King Senwosri I. (2400 B.C.) in the Cairo Museum (No. 3666) (6). The blue-glazed hippopotami of this period, with the reeds and water-plants in purplish black upon their bodies to indicate their habitat, are well known. Fine specimens of these are in the collection of the Rev. Wm. MacGregor at Tamworth (8).

The blue glaze of the XIIth Dynasty deepened in colour under the XIIIth, to which the fine blue bowls with designs (in the manganic black) of fish and lotus plants belong (8) (British Museum, Nos. 4790, &c.). The finest specimens of XVIIIth Dynasty faience were found at Thebes (from Deir el-Bahri, in the neighbourhood of which place there may have been an important factory for the manufacture of votive bowls, cups, beads, &c., of this fine faience, for dedication by pilgrims in the temple of Hathor (good collection in British Museum). Towards the end of this dynasty polychrome glazes came into fashion; white, light and dark blue, violet, purple, red, bright yellow, apple green and other tints were used, not only for smaller objects of faience, such as rings, scarabs, kohl-pots, &c., but also for vases, e.g. No. 3955 of the Cairo Museum (Amophenish III. wine-bottle). The ground colour of which is white with a decoration of flower wreathe in blue, yellow and red, with an inscription in delicate blue (8). This
polychrome faience was also now used for the *ushabtis* figures which were placed in the tombs; hitherto they had been made exclusively of stone or wood, never of glazed stone or pottery; henceforward they were made exclusively of faience, but the polychrome glazes (e.g. British Museum, Nos. 34,180, 34,185) were soon abandoned, and the plain blue and black of the ordinary vases was adopted. The *ushabtis* of King Seti I. (British Museum, No. 22,818, &c.) (9) are fine specimens of this type. Under the XXth Dynasty the blue paled and became weak in quality, but the priest-king family of the XXIst used for their *ushabtis* a most brilliant blue glaze, an extraordinary colour which at once distinguishes the faience of this period from that of all others (9). The same brilliant glaze was used for vases of various kinds as well. The polychrome ware had developed into a style of inlaying with glazed faience, which we see at Tel el-Amarna under the XVIIIth Dynasty (1400 B.C.) (10), and at Tel el-Yahudiya under the XIXth (1200 B.C.), used for wall decoration. After this time polychrome ceramic decoration seems to have died out in Egypt, but was retained in Asia (see below).

The technical skill of the New Empire potters is shown by such a remarkable object as the gigantic *Uaaj-sepectre* of blue glazed faience, now in the Victoria and Albert Museum (12, 8). This is the largest known piece of Egyptian glazed faience; really large vases of faience are not found. Faience vases were very commonly built up or carved out of a ball of the dried material, perhaps held together by some mucilaginous substance—it seems impossible that such a substance could ever have been fashioned on the wheel. Sometimes even small vases were made of separately moulded pieces united by a glazy material (8). Under the XXIInd Dynasty small glazed vases with figures of deities or animals in relief became common; these were made in moulds (6). In the matter of form the faience pottery of the New Empire follows the lead of the new earthenware types. Forms had altered considerably from those of the XIIth Dynasty. In place of the simple flowing lines of that period, we now find egg-shaped bodies with cylindrical necks, with or without handles; great *amphorae* with almost pointed bases, sometimes with the handles perched upon the shoulders of the vase; flat-topped, squat jars; little handleless vases somewhat resembling the modern *kulla*, "mit mehrfach eingezogenem Bauch" (V.B.), and the common flat flask-like type known as the "pilgrim bottle" (6, 13, 14, 15).

Owing to the extended foreign relations of Egypt at this time, imported vases from Greece and Asia, including Mycenaean Bügelkannen and Cyproite black "base ring" jars, have been found in the tombs and deposits of this age (14). Imitations of foreign forms, especially the Bügelkannen, are found chiefly in faience (British Museum, 22,731, is an imitation of a Minoan jug from Crete). The faience forms of the VIIIth and XXIInd Dynasties include also the *kulla* shape, the pilgrim bottle, miniature *amphorae*, &c. (see fig. 6), and miscellaneous forms not found in common pottery, imitating metal and stone vases, e.g. the blue-glass, ribbed pot of the XXIInd Dynasty, imitating bronze originals, and the *aflabaston* of the VIIIth; these last go back to the XIIth Dynasty. Very pretty cups in the shape of lotus flowers (see fig. 7) are to be seen in most museums; they are of the XIXth Dynasty, and mostly came from Tuna (6, 8). The continuance of the old red polished ware of the IVth Dynasty during the Middle Kingdom to the time of the XVIIth Dynasty has already been mentioned. Characteristic of the latter period of this ware are long juggs with attenuated body and single handle, which, because they have been found with Mycenaean objects in Cyprus, have been considered to be of foreign, probably of Syrian origin. They evolved, however, be Egyptian. Vases of the same ware in the shape of men and animals are not uncommon (17). Another ware of this period has a highly polished yellow face, sometimes becoming reddish, and passing off into a pinkish red; in this ware the pilgrim bottles are common. An unpolished, brittle, and thin yellow ware was also used largely for wine-vases. The rougher, commoner red and brown ware at this period became decorated with designs, chiefly of lily wreaths, &c., in paint of various colours (15). This new development hid the ugly colour of the common pottery and was a cheaply obtained imitation of the expensive, polychrome glazed ware of the period (see fig. 8). This painted pottery continued in use until about the time of the XXIIInd Dynasty. From this time onwards, till the Ptolemaic period, the commonest pottery was a red ware, usually covered with a white slip. Under the XXVIIth Dynasty a finer homogeneous white ware occurs, usually for vases with a rude representation of the face of the god Bes on their bodies.

The XXVIIth Dynasty marks a new period of development in the history of Egyptian faience. The old deep blue colour had gradually deteriorated into an ugly green (British Museum, No. 8602), which was replaced by the Saite pottery with a new light blue of very delicate tint, imitated, in accordance with the archaistic spirit of the time, from the old light blue of the earliest Dynasties. The glaze itself is very thin and "sugary" in texture. The old decoration of the blue with designs and inscriptions in manganese-black is abandoned; on the *ushabtis* the inscriptions are now incised. Side by side with this light blue glaze there was an unglazed faience, a sort of composition paste with the colour going right through. It has more variety of colour than the glazed faience, light green and a dark indigo blue being found as well as the Saite light blue. Sometimes it is of a very soft, almost chalky consistency. It was used for vases, but more generally for small figures or scarabs (6). The commonest vase-form of this period is the pilgrim bottle, now made with the neck in the form of a lily flower, and with inscriptions on the sides wishing good luck in the New Year to the possessor. These flasks appear to have been common New Year's gifts.

Under the Sebennytos kings of the XXVIIth Dynasty a further new development of glaze began, of a more radical character than before. The colour deepened, and the glaze itself became much more glassy, and was thickly laid on. The new glaze was partly translucent, and differed very greatly from the old opaque glaze. It first appeared on *ushabtis* at the end of the Saite period. A curious effect was obtained by glazing the head-dress, the inscription &c., of the *ushabtis* in dark blue, and then covering the whole with translucent light blue glaze. This method was regularly used during the succeeding Ptolemaic and Roman periods, when the new style of glaze came into general use. A yellowish green effect was obtained by glazing parts of the body of the vases in yellow and covering this with the translucent blue glaze. This method was used to touch up the salient portions of the bodies.
CERAMICS

[WESTERN ASIA]

the designs in relief, imitated from foreign originals, a style which now became usual on vases. The usual decoration is mixed Egyptian and classical, the latter generally predominating. A large range of colours was employed: purple, dark blue, blue-green, grass-green, and yellow glazes all being found. The glaze is very thickly laid on, and is often "crazed" (6, 8). A remarkable instance of this Romano-Egyptian faience is the head of the god Bes in the British Museum (No. 35,028). A hard, light blue, opaque glaze like that of the XXVIth Dynasty is occasionally, but rarely, met with in the case of vases (British Museum, Nos. 37,407, 37,408).

We know something of the common wares in use during this period from the study of the ostraka, fragments of pottery on which dated tax-receipts, notes, and so forth were written. From the ostraka we see that during the Ptolemaic period the commonest pottery was made of red ware covered with white slip, which has already been mentioned. At the beginning of the Roman period we find at Elephantine a peculiar light pink ware with a brownish pink face, and elsewhere a smooth dark brown ware. About the 3rd century A.D. horizontally ribbed or fluted pots, usually of a coarse brown ware, came into general use. These were often large-sized amphorae, with very attenuated necks and long handles (see fig. 9). During the Byzantine (Coptic) period most of the pottery in use was ribbed, and usually pitched inside to hold water, as the ware was loose in texture and porous.

During the Coptic period, a lighter ware was also in use, decorated with designs of various kinds in white, brown or red paint on the dull red or buff body. In Nubia a peculiar development of this ware is characteristic of the later period (Brit. Mus. No. 30,712). A polished red ware of Roman origin (imitation Arretine or "Samian") was commonly used as well.

The heavily glazed blue faience continued in use until replaced in the early Arab period by the well-known yellow and brown lead-glazed pottery, of which fragments are found in the mounds of Fostat (Old Cairo).

Western Asia.—Palestine. The most ancient Palestinian pottery is the rough "Amorite" ware from Lachish (Tel el-Hesi) which sometimes has wavy handles like the prehistoric Egyptian (18). Later we find actual Mycenaean pottery in Philistia (19), an interesting testimony to the truth of the legend which brings the Philistines from Crete; the fourth and fifth cities of Lachish (1200-1000 B.C.) show us the first ordinary Phoenician or Israelite pottery—buff or red lamps and bowls, the latter with the handles sometimes painted in bistre, and vases showing strong Egyptian influence; while pottery from Cyprus and elsewhere is found as in Egypt.

The most remarkable later development of Palestinian pottery is the Phoenician imitation of Egyptian faience of the Saitic period, of which the characteristics are well known. Some of this may actually have been made in Egypt.

The course of the potter's art in Mesopotamia and Persia appears to have run on lines of development parallel with the art in Egypt, for the country between the Tigris and the Euphrates is rich in good clays, and, wherever the invention of glass arose, its application to pottery decoration was certainly developed at an early period in Egypt and in Mesopotamia.

Two characteristic uses of clay wares must, however, be pointed out, though they have nothing to do with vase-making.

1. The Babylonian and Assyrian use of clay shaped into tablets, cylinders and prisms, to produce an imperishable record of the literature of the time. The cylinders and prisms werethrown on the potter's wheel and are consequently hollow; the circular form was then sliced down, and the surface was impressed with cuneiform inscriptions, the prism, tablet or cylinder being subsequently dried and fired.

2. The architectural use of glazed bricks and slabs. While the Egyptians remained content for the most part with the application of their brilliant alkaline glazes to small and delicately-finished objects, the Babylonians and Assyrians developed an architecture decorated with glazed and coloured brickwork. The bricks were of very open texture, and the ornamental pattern or figure subjects were obtained by a strong outline in dark-coloured clay which formed a kind of cloison or boundary, the shallow cells between being filled in with coloured clays—yellow, red or white—or with coloured glazes of turquoise, green or blue, yellow and purplish brown. These glazes are obviously like the Egyptian, but they are more coarsely prepared and are always full of bubbles and consequently more or less opaque. Yet the severe simplicity of the method, the splendid colour effect, strong yet sumptuous, entitles these productions to a very high rank among all the world's work in clay and glaze. The "Frieze of the Archers" now in the Louvre may be mentioned as one of the finest productions of its kind, and the Louvre and British Museum possess the finest collections of this early architectural use of glazed and coloured clay. (See also MURAL DECORATION.)

Coming to ordinary pottery we find that in early times well-formed vases made of good clay, unglazed and unpainted, were made. Small figures of deities made of the same clay are often found. It is practically the same terra-cotta as that of the inscribed tablets. None of the forms are particularly distinctive (see fig. 10). The excavations of the French in Persia have brought to light at Moussian in Susiana an extremely interesting painted ware, which belongs to a very early period. The decoration is usually geometrical. The technique seems to be analogous to the Mycenaean-Greek (Firnismalerei), and the whole effect is very like that of the Greek, Late Mycenaean or Dipylon pottery. The ware is buff in colour and fine in texture, with a polished surface. The decoration is sometimes in polychrome, but usually in the grey-brown iron-glaze (?) alone. This pottery degenerates later and finally disappears (20).

During the Sargonide period in Assyria (7th century B.C.) we find a polychrome faience (colours usually white and brown) obviously of Egyptian origin. It was used, not for vases, but architectonically for friezes, ornamental bosses, &c. Its origin may be found in Egypt under the XVIIIth Dynasty, when Egyptian influence extended to the Tigris, and Babylonia had regular diplomatic relations with Egypt. In Asia this polychrome decoration in glazed wares continued to be used long after it had ceased to be made in the country of its origin; the enamelled brick decoration of Persepolis is the descendant of the glazed inlay decorations of Tel el-Amarna, Tel el-Yahudiya and Kuyunjik. In the Sargonide period blue glazed vases occur (see fig. 11) which are probably of Egyptian origin or are Phoenician imitations of Egyptian faience.

Characteristic of the Parthian period is a coarse green glazed pottery of which the slipper-shaped coffins of the time were made.

CERAMICS

Greek, Etruscan and Roman

Greek. Study of Greek Vases.—It is not so many years since an account of Greek pottery would naturally have followed chronologically the history of Egyptian pottery with little overlapping; but recent discoveries have reversed all such ideas, and, while up to the end of the 19th century the earliest remains to be traced on Greek soil could be assigned at the furthest to the period 2500-2000 B.C., it is now possible not only to show that this period technical processes were highly developed, but even to trace the development of Greek pottery from Neolithic times. This result has been mainly brought about by Dr. Arthur Evans's researches at Cnosus in Crete, and traces of similar phenomena are not wanting in other parts of Greece. Whether the race which produced this pottery can strictly be called Greek may be open to question, but at all events the ware is the independent product of a people inhabiting in prehistoric times the region afterwards known as Greece; its connexion with the pottery of the historic period can now be clearly traced, and in its advanced technical character and the genuinely artistic appearance of its decoration even this early ware proclaims itself as inspired by a similar genius.

The study of Greek vases has thus received an additional impetus from the light that it throws on the early civilization of the country, and its value for the student of ethnology. But it has always appealed strongly to the archaeologist and in some degree also to the artist or connoisseur, to the former from its importance as a contribution to the history of Greek art, mythology and antiquities, to the latter from its beauty of form and this latter aspect of the vase was indeed redirected to the painted vases at the end of the 17th century, though for a long time they served as little more than an adjunct to the cabinet of the amateur or a pleasing souvenir for the traveller; but even during the 18th century it dawned on the minds of students that they were of more than merely artistic importance, and attention was devoted to the elucidation of their subjects, and attempts made to arrive at a chronological classification. Two facts must, however, be borne in mind: firstly, that down to the middle of the 19th century the great majority of painted vases had been found only in Italy; secondly, that these vases were mostly of the later and more florid styles, which, if artistically advanced, are now known to represent a decadent phase of Greek art.

From the former cause arose the notion that these vases were the product not of Greek but of Etruscan artists, and so the term Etruscan vase "arose and passed into the languages of Europe, surviving even at this day in popular speech in spite of a century of refutation. Meanwhile, the study of the subjects depicted on the vases passed through the successive stages of allegorical, historical and mystical interpretation, until a century and more of painstaking study led to the more rational principles of modern archaeologists.

Sites and Discoveries.—The sites on which Greek vases have been found cover the whole area of the Mediterranean and beyond, from Peloponnese to Spain, from the Nile Delta to Austria. The majority, at all events of the finer specimens, have been extracted from the tombs of the greater cities and several other sites in Etruria; those of the later period or decadence have been found in large numbers on various sites in southern Italy, such as Capua, Cuma and Sicily; and in North Africa, especially in the Cyrenaica, where the finds are mostly of the 4th and 5th centuries B.C. In Greece proper the most prolific site has been Athens, where the finds extend from the 8th century B.C. down to the decadent productions of the 4th century; one group, that of the white vase so-called, is almost peculiar to Athens. Next to this city, Corinth has been the most productive, especially in pottery of the archaic period and of local manufacture. Large quantities of pottery of all periods have been yielded by Thebes, Tanagra and other sites in Boeotia, and of the "Mycenaean" period at Mycenae, Argos and elsewhere. But on the whole painted pottery is rare in other parts of the mainland. Among the western islands of the archipelago, Aegina and Euboea have produced fruitful evidence of all periods; Thera, Melos and other of the Cyclades are remarkable for pottery of the archaic and late periods; painted vases from Crete are now famous for the wondrous series of painted and ornamented pottery of pre-Mycenaean date, which can be traced back even to the Neolithic period, and the discovery of which has entirely revolutionized the reconceived theories on the appearance of painted pottery in Greece. This has been found in the recent excavations at Cnosus, Phaistos, Malia and elsewhere. In Asia Minor there have been some important finds on the coasts of Ionia, but none along the coast; some of the islands, more especially Samos and the Cyclades have been fruitful in this respect. At Kerch and elsewhere in the Crimea, large numbers of vases have been found, of which the 5th and 4th centuries B.C. have given the clearest light. Crete is now famous for the wondrous series of painted and ornamented pottery of pre-Mycenaean date, which can be traced back even to the Neolithic period, and the discovery of which has entirely revolutionized the reconceived theories on the appearance of painted pottery in Greece.

The great majority of these vases have been found in tombs; but some important discoveries have been made on the sites of temples and sanctuaries, as on the Acropolis of Athens, or at Naukratis. In such cases the vases are seldom complete, having been broken and cast away to publish graves, where the fragments have remained undisturbed. The tombs vary greatly in form, those of Greece being usually small rock-graves or shafts, those of Italy often fine and elaborate chambers with architectural details, and the manner in which the vases are found in these tombs varies greatly. Plain unornamented pottery is almost universal, and may be considered to have formed the "tomb-furniture" proper—the painted vases being as in daily life merely ornamental adjuncts.
Shapes and Uses of Greek Vases.—The enormous number of painted vases now collected in museums is in itself sufficient evidence of the important part they must have played in the daily life of the Greeks, and the care which was bestowed on their decoration shows that in their opinion the appreciation in which they were held. It is, however, noticeable that, with the exception of general allusions to pottery and its use in daily life, there are singularly few passages in classical literature which throw light on the purposes for which these vases were used. It is, indeed, not unusual to find that elsewhere it is clear that metal vases are intended. Athenaeus and the lexicographers have put on record a long list of names of shapes, but it is only in a few cases that we can be certain what forms they describe or whether the typical forms of existing vases can be identified with the literary descriptions.

We have then two questions to consider in this section: firstly, the uses to which painted vases were put by the Greeks; secondly, the classical names of the various forms of plain and painted pottery with which we are concerned.

As we have seen, the majority of painted vases have been discovered in tombs, where at first sight seems to suggest that they were made principally for sepulchral purposes; but that they also had their place in daily life as may be gathered from inscriptions which show that metal vases are intended. Athenaeus and the lexicographers have put on record a long list of names of shapes, but it is only in a few cases that we can be certain what forms they describe or how the typical forms of existing vases can be identified with the literary descriptions.

Vases were used as measures, as in the case of a small one-handled cup in the British Museum (see fig. 15), found at Cerigo (Cythera) and inscribed "a cup of 3 litri"; in one instance, the mark is incised "a cup of one-fourth of a pint. Another vase found at Athens is supposed to represent the worship of Eros, with a capacity of 0.96 litre; it is inscribed ληγόμενος or "official measure," and bears the name of the city. Other vases of this name are found on many Athenian vases, such as the amorpha or kotyle, were adopted to indicate measures of capacity for liquid or dry commodities. Earthenware vessels were used for storing both liquids and food, for the preparation of foods and for the offering of liquids and offerings. They were also used for the storage of liquids and food, for the preparation of foods and for the offering of liquids and offerings. They were also used for religious and secular purposes. As for instance at banquets or in religious ceremonies.

Vases were used as measures, as in the case of a small one-handled cup in the British Museum (see fig. 15), found at Cerigo (Cythera) and inscribed "a cup of 3 litri." In one instance, the mark is incised "a cup of one-fourth of a pint. Another vase found at Athens is supposed to represent the worship of Eros with a capacity of 0.96 litre; it is inscribed ληγόμενος or "official measure," and bears the name of the city. Other vases of this name are found on many Athenian vases, such as the amorpha or kotyle, were adopted to indicate measures of capacity for liquid or dry commodities. Earthenware vessels were used for storing both liquids and food, for the preparation of foods and for the offering of liquids and offerings. They were also used for religious and secular purposes. As for instance at banquets or in religious ceremonies.

The painted vase was used at banquets or on great occasions we learn from scenes depicted on the vases themselves, in which vases painted with subjects appear in use. In the case of a few vases, the prize was given of the Panathenaeic amphora to a class of prizes given for victors in the games at Athens in the Panathenaeic festivals, where, however, they do not represent the same as regards the carrying of modern racing cups. Vases were also used as toys for children, as is proved by the little clay cups, doll's dishes, suspended on the walls of the tombs of children at Athens, on which are depicted children playing on various games. They also served a purely decorative purpose as domestic ornaments, being placed on columns or shrines; or, in the case of a few cups and bowls, suspended in gardens.

Many of the later Greek and Italian painted vases are very carefully regarded on the one side, which was obviously not intended to be seen. We now come to the uses of religious purposes, dedicatory, sacrificial, or votive. It is clear, however, that all these vases have a religious character and are sometimes used as offerings which attest their use for such purposes. It was a well-known Greek custom to clear out the temples from time to time and form a heap of rags (proctote) of the priests and statues of the gods, which were used by the public for a time and then thrown away. Many of these vases were found in the Agora at Athens, Corinth, and at Naucratis in Egypt, where we have preserved these vases.

At Naucratis many of the fragments bear inscribed inscriptions, such as Αναπλωνεμεν εις, "I am Apollo's," (possibly a memorial of the priest's, to mark consecrated property); or, "I am the property of the temple of Apollo." So also "I am the property of the temple of Dionysus," Fig. 14 gives another example with a dedication to Apollo at Pentecostoi, near Corinth, a large series of painted tablets (ειφανεις), dating from 600 to 550 B.C., with representations of Poseidon and dedicatory inscriptions to that deity, were found in 1859. It is clear from these conclusions that the use of these vases during the period, and tablets painted with figures and hung on trees or walls are often depicted on the vases, usually in connexion with scenes representing sacrifice or offerings.

The clay for the potter was doubtless prepared by a system of sedimentation, so as to get rid of all coarse particles. It was mixed with water and decanted into a series of vats so that ultimately fine clay of two or three grades was obtained. Both red and white slip were used, and both these bodies low-fired. It is therefore likely that mixtures of different days gave the best results. The clay for the Athenian vases was obtained from Cape Kolias in Attica; and it was introduced in the 7th century B.C. It was produced at the lovely deep orange gas-slow, which distinguishes the best vases. Corinth, Cnidus, Siphnos, and other places were also famous for their clays, and at the first named tablets have
been found bearing representations of the digging of clay for pottery. The improved manipulation of the clays, and the increasing knowledge that the colour of a clay could be modified by admixture of other substances such as ruddle and ochre, really paved the way for what is known as the glaze of the Greek painted vases. This delicate gloss, so thin as to defy analysis, has been commonly called glaze, but it cannot be a glaze in the sense of a separate coating of finely-ground glass superimposed upon the clay. In all probability, as the Greek potter used finer and finer clays and so was enabled to perfect his shapes, he found that after a vase had been “thrown” he could get a closer texture on it by dipping it in a slip of still finer clay material and then smoothing it down and polishing it on the wheel when sufficiently dry. But the mixtures he would use for such a purpose—of very siliceous clay and ochre—would, when they were burnt in the Greek kiln, not only fire to a beautifully bright colour, but also give a glossy surface, especially where the flames had freely played about them; and it is more in accordance with our knowledge to believe that the exquisitely thin gloss of the finest Greek red vases was produced in this way, for it seems impossible that it can have been a coating of any special glaze.

In any case we may state broadly that the body of Greek vases is always fine in grain, fired hard enough to give forth a dull metallic sound when it is struck, but seldom fired above a temperature of about 900° C., which a modern potter would consider very low. When broken the inside is generally found to be drier in colour, and is often yellow or grey, even where the external surface is red. The material is exceedingly porous, and allows water to ooze through it (another proof that it was not glazed). Numerous analyses of the material of Greek vases have been published, but they tell us nothing of the secrets of the Greek potter. The results of a great number of these analyses may be summed up as follows: silica, 52-60 parts; alumina, 13-19 parts; lime, 3-10 parts; magnesia, 1-3 parts; oxide of iron, 12-19 parts. Analyses of a thousand ordinary simple red burning clays would give a similar result. It is to the glory of the Greek potter that with such ordinary materials, by the exercise of selection, patience and skill, he achieved the fine artistic results we see. He did as much as can be done with natural clay materials, but the glory of painted colour and glaze, like the later Persian or Chinese, was not for him.

Manufacture of Vases.—The earliest Greek pottery is, like all primitive pottery, hand-made. The introduction of the potter’s wheel into Greece was the subject of various ancient traditions, but we now know that it can be easily traced by a study of the primitive pottery of Crete, Cyprus or Troy. In Cyprus, for instance, the Bronze age tombs of 2500-1500 B.C. contain only hand-made pottery, but in the next period (1500-1000 B.C.) we find hand-made and coarse vases side by side with a more developed kind of painted pottery—the “Mycenaean”—obviously made on the wheel. It seems probable, therefore, that the wheel was introduced into Greece about 1500 B.C.; it was certainly known to Homer, as a familiar allusion shows (II. xvii. 600). It was still a low circular table turned with the hand, not the foot; representations of its use are seen on several vases of the archaic period (fig. 16), and they further prove that the vase was replaced on the wheel for the subsequent processes of painting, polishing and adding separately modelled parts, as well as for the original shaping or “throwing.”

The method of shaping the vase on the wheel, which is the same as that still in use, need not be described in detail; the feet, necks, mouths and handles were modelled separately or shaped in moulds, and attached while the clay was moist, as is also indicated on a vase. Large and coarse vases, such as wine casks (άρυβαία), were always modelled by hand on a kind of hooped mould (κατάφορο). Parts of vases were modelled by hand at all periods by way of decoration. Even in the geometrical period we find horses modelled in the round on the covers of vases and later on handles enriched with moulded figures of serpents twining round them. Such embellishments are frequently, if not always, deliberate imitations of metal forms, but the plastic principle is one which obtained in Greek pottery from the very first, as for instance in the primitive pottery of Troy, in which the vases are often modelled in human or animal forms; and the same principle is involved in the common practice of speaking of the “neck,” “shoulder” or “foot” of a vessel. In the best period the practice of adding moulded ornaments or of modelling vases in natural forms took a subsidiary place, but

**Fig. 15.** Shapes of Greek Vases.

**Fig. 16.** Votive tablet from Corinth; a potter applying painted bands while the vessel revolves on the wheel.
examples occur from time to time, as in the beautiful rhyta or drinking-horns of the red-figure period (Plate II., fig. 58), or in smaller details such as are seen in handles enriched with heads in relief, a favourite practice of the potter Nicothenes. In the 4th-century vases of southern Italy the handles are often much ornamented in this fashion, as in the large kraters, where they are adorned with masks in relief.

The system of moulding whole vessels or ornamenting them with designs in relief taken from moulds really belongs to the art, when limitations of men, who are engaged in the painted pottery. Even then it is rare to find whole vessels produced from a mould, especially in the case of those in the form of human figures or animals (Plate II., figs. 57 and 58), which almost come under the heading of terra-cotta figures, except for the fact that they are usually painted in the manner of the vases. But in southern Italy the tendency to imitate metal led to the popularity of ornaments made separately from moulds and attached or let into vases otherwise (a). Vases of this period, with needled bodies, must also have been made from moulds, as were a series of phialae or libation-bowls associated with Cales in Campania (Plate II., fig. 56), which are known to be direct imitations of metal.

All or nearly all, the vases covered with a plain black glaze or varnish, and painted decoration is rare except in the case of those moulded in special forms or of a certain class made in Apulia with opaque colouring laid on the varnish. Some of these black vases of the 5th century A.D. are ornamented with glazed heads of men made with a metal impression in the moist clay. This decoration is confined to simple patterns.

After the vases had been made on the wheel they were dried in the sun or in a building and then placed in the kiln for firing and painting; it is also probable that the gloss was brought out by a process of polishing, the surface of the clay being smoothed with a piece of wood or hard leather. On a vase in Berlin a boy is seen applying a kind of skin to the raw clay, which was done for this purpose: the cup, being shown in red on the vase, has evidently not been varnished. Many vases are varnished black all over the exterior (whether decorated with designs or not) with the exception of the foot and lip.

The process of baking was regarded as one of the most critical in the potter's art. It was not indeed universal, as we read of sun-dried vessels for utilitarian purposes, but all the vases that have come down to us have been baked. The amount of heat required was very great. Some of the vases are burnt red hot and are always of a dull black. Many examples exist of discoloured vases which have been subjected to too much or too little heat, the varnish having acquired a greenish or reddish hue. Or again the red gloss is sometimes turned to an unattractive brown as a result of remaining unimpaired. Other accidents were liable to occur in the baking, such as the cracking under the varnish of red hot, or the damaging of the shape by vases knocking against one another and so being dented or broken.

The form of the oven was the simplest (fig. 17). No furnaces have been found in Greece, except in the cases of the vases used in Italy, but we have a variety of evidence from vases-paintings. They were made in the large Olympus and Cales found in Italy, but we have a variety of evidence from vases-paintings. They were made in the large Olympus and Cales found in Italy, but we have a variety of evidence from vases-paintings. The Painting of Vases.—We may distinguish three principal classes of painted pottery, of which two admit of subdivision.

1. Primitive Greek vases with simple painted ornaments, chiefly linear and geometrical, laid directly on the clay with the brush. The red-figure was the earliest of the three, the white-figure coming into black. The execution varies, but is often extremely coarse.

2. Greek vases painted with figures. These may be divided as follows:

(a) Vases with figures in shining black on a red glossy ground.
(b) Vases with figures left in the glossy red on a ground of shining black.

3. Vases with polychrome decoration.

(a) Vases of various dates with designs in outline or washes in various colours on white ground (these range from the 6th to the 5th century B.C.).
(b) Vases of various dates with designs in opaque colour laid on white ground (ranging from the primitive period to the 3rd century B.C.).

Of these second group is by far the largest and most im-

being applied with a fine brush in monochrome—black, yellow, or orange—following the lines of the sketch. For the drapery and other details polychrome wares were employed, laid on with a large brush. All varieties of red from rose to brown are found, also violet, yellow, blue, black and green. Hair is treated either in outline or by means of the fine monochrome.

Finally, we have to deal with the class of vases (b) in which opaque pigments are laid over the surface of the shining black with which the whole vase is coated. This method is met with at three distinct periods in the history of vase-painting, separated by long distances of time.

We first find it in the earlier Cretan or Kamares ware, where it seems to have been introduced not long after the close of the New Minoan period (1700 B.C.). It is clear that the contrasted method of “dark on light” painting, till it was finally ousted by the latter at the height of Mycenaean civilization in Crete. The colouring is very varied, originating in the use of a wide white background, except forblack, purple and black incised lines, so that the technique is virtually black-figured, though the appearance of the vases is often red-figured. Lastly, it appears in southern Italy as a final effort of vases painted in the style of the Red-figured and Black-figured Phoenicians, and is unknown in Mycenaean tombs.

The process appears again at the end of the 5th century in a small class of Attic vases, which have been regarded as a sort of transition between the black-figured and red-figured. White and red-orange are here employed, sometimes with accessory, blue and green. The vases are also distinguished by the use of ornaments in relief. They were also occasionally made in Greece proper.

Remarkably few colours were used by the Greek vase painters, especially in the early period. The only purple pigments employed were the purple produced from iron oxide, but red was used for lines on the white lathyros is an ochre (Alkcon, rubrica). The white also used for accessories is an earth or clay; in the slip coating of the white ground vases it assumes the consistency of pipe-clay. Yellow, which is rare, is often in the form of ochre. The late vases of the 5th century are of black, and not green are produced from artificial compounds containing copper. A number of the colours, such as blue, rose and green, produced by the polychrome painters, are obviously artificial pigments which have not been represented. It is evident that it was laid on over a raised ground of clay thinly modelled with a small tool or brush, and was attached by varnish, not by fire.

Potteries and Inscriptions.—The potters who made these vases were mostly, if not all, Athenians, and their names are known in many cases. We have an Amapis (an Egyptian name), a Brygus (a Scythian), a Lydus and a Sicythus. The dialect of many of the inscriptions on Attic vases is similar to Greek, and sometimes the name of the potter is mentioned, but it may be merely due to the use of a vernacular. They formed a guild or fraternity, and in each pottery there was probably more or less division of labour, the more simple processes being the work of slaves. Though they were all of the same kind, this does not mean that there were any general representations of the interior of potteries. Others again “specialized” in different shapes, and were known as κρουσαῖδες, κρουσάριον, and so on.

Over a hundred names of artists are known, found on some five hundred vases. They go back to about 700 B.C., the earliest names being those of the Attic Corinthia and Boeotian vases. Some of the signatures are found on Attic black- and red-figured vases. Some, such as Andocides, made vases in which the two methods are combined. The best known is Necosthenes, whose signature occurs eight times on Attic vases; one ording to for. Of sigla there are four—(1) an ψυγος; (2) a δες ψυγος; (3) a δες ψυγος και μονες; (4) A ψυγος. B ψυγος. Where ψυγος alone occurs (as in a signature of Euxilus), it probably refers to the master of the pottery. When ψυγος appears with a signature, it is the work of a single potter. In some cases the share of the actual artist is clearly indicated. Some artists, such as Duris and Makron, sign ψυγος alone; in all cases, the form of signature affords us a useful guide to their style.

The names of the signatories to these vases, which include those descriptive of subjects or persons, ejaculations uttered by the figures, conivisos exclamations, or the κακαί names discussed below; all these are painted on the designs themselves. They are not mere signatures, for they are often incised by the owners with their names and memoranda scratched under the foot, probably made by the potter or his workmen relating to the number of vases in a batch or set and their price.

Vase-painting.—The Greek vases of our period lower down in the 5th century in the order of time are for the most part decorated. Black-figure pottery is often found which approximates more in appearance to porcelain, but, though often spoken of by that name, it is not porcelain at all, but is analogous to the Egyptian glazed faience, of which it is a perfect imitation. It is distinguished by the white gilting material of which it is made, largely composed of sand, and forming what is sometimes known as "rit" from its semi-translucent consistency. The surface is covered with a glaze, usually of a pale blue or cream colour, but other colours such as a manganese-purple or blue-black were used. The forms are also often of a different kind, the form of helmeted heads or animals, which are purely Greek in style.

In the Hellenistic period the fashion was revived at Alexandria, and under the Ptolemies large jars of blue-enameled faience with figures in relief and bearing the names of reigning sovereigns were made. The technique was transferred to southern Italy. Two of these are in the British Museum (Egyptian department). The same collection includes a very beautiful vase in imitation of a duck, found in a tomb at Taranto, but undoubtedly of Alexandrine make, and a head of a Ptolemaic queen, with a surface of bright blue glaze.

A few vases of this period are so-called porcellaneous ware was replaced by a variety of ware characterized by a brilliantly coloured glaze coating, in which the presence of lead is often indicated. This ware was principally made at three centres; at Tarasus in Asia Minor, at Alexandria, and at the Cesarian Gaul. But it was probably also made in western Asia Minor and elsewhere. It is not confined to vases, being also employed for lamps and small figures; the vases are usually of small size, in shapes imitated from metal (Plate II., fig. 59). The colour of the glaze varies from a deep green to a yellowish brown. The decoration is often of a different tint from the exterior. Many of these vases are decorated with figures or designs in relief, others are quite plain. The colours of these glazes are of course due to the addition of oxide of copper and iron, mixed with a ground of clay, and they are strictly analogous to the green and yellow glasses of medieval Egypt.

Historical Account of Greek Vase-Painting.—It has been indicated in the section dealing with technical processes that Greek vases may be classified under four headings according to the character of the decoration, and this classification may with a slight modification be adopted as a chronological one, the history of the art under four main heads, under which it will be convenient to describe its development from the earliest specimens of painted pottery down to the period when it was finally replaced by other methods of decoration.

These four classes and their main characteristics may be summarized as follows:—

I. Vases of the Primitive Period from about 2500 to 2000 B.C., including both the Cretan-Mycenaean epoch and the early ages of Hellas. The objects referred to the Cretan-Mycenaean period are either decorated in polychrome on a shining black ground or conversely in shining black on a buff ground; in the latter, the decoration is in brown or black (usually dull, not shiny) on an unglazed ground varying in colour from red or a reddish-brown to a yellowish brown, according to its naturalistic treatment of plant and animal forms; in the latter the ornaments are chiefly linear, floral or figures of animals; human figures and mythological scenes being very rare.

II. Black-figured figures, painted in shining black on a glossy ground varying from dark grey to bright orange red, with engraved lines and white for details; subjects mainly from mythology and legend.

III. Red-figured or polychrome red-vases, figures drawn in outline on red clay and the background left in shining black; inner details indicated by painted lines or dashes of purple and white, scenes from daily life or mythology. With these are also vases with polychrome figures on white ground. In these, what is called the "classical" style, the perfection of vase-painting is reached between 480 and 450 B.C.

IV. Vases of the Decadence, from 400 to 200 B.C.; mostly from southern Italy, technique as in Class III., but the drawing is free.

1 On this subject see in particular Mazard, De la connaissance par les anciens des glaces plombifere, a scientific and valuable monograph (1879); also Ravet, "Elle Cézanne, Histoire de la céramique grecque," p. 305 (or B.M., Cat. of Roman Pottery, Introduction).
and often careless, and the general effect gaudy; subjects funeral, theatrical and fanciful. At the end of this period vases are largely replaced by plain shining black pottery modelled in various forms, or with decorations in relief, all these being imitations of the metal vases which began to take the place of painted wares in the estimation of the Hellenistic world.

I. Vases of the Primitive Period.—It has been noted in the introductory section that it is possible to trace the development of pottery in Greece as far back as the Neolithic period, owing chiefly to the light recently thrown on the subject by the excavations in Crete. These have yielded large quantities of painted pottery of high technical merit, usually with decoration in polychrome or white on a dark ground, in what is known as the Kamares ware, covering the period 2500-1500 B.C. (fig. 20). This was gradually superseded by painting in dark shining pigments on a light glossy ground during the later Minoan period (1500-1000 B.C.), forming what is known as the "Mycenaean" style. The subjects, though chiefly confined to floral ornaments or aquatic plants and creatures, are marvellously naturalistic yet decorative in their treatment, often rivalling in this respect the pottery of the Far East. In the latter part of this period this class of pottery was spread all over the Mediterranean, and large quantities have been found in Greece, especially at Mycenae, in Rhodes and other Greek islands, and in Cyprus, where a series of vases with animals, monsters, and even human figures shows what is probably the latest development of the pure Minoan or Mycenaean style.

Outside Crete the earliest Greek pottery has been found in Cyprus and at Troy, with simple incised or painted patterns on a black polished ground, the vases being all handmade, and often treated in a plastic fashion with rude modelling of human or animal forms (figs. 21, 22); these cover the period 2500-2000 B.C. Early painted pottery, parallel with the Kamares ware, has been found in Thera and in the important cemeteries of Phylakopi in Melos. But until the general spread of Mycenaean civilization and art in the latter half of the second millennium there is no site except Crete where a continuous and successful development can be studied.

About the time which is represented in Greek tradition by the Dorian invasion (1100 B.C.) the then decadent Mycenaean civilization was replaced by a new one much more backward in development, making pottery of a far simpler and more conventional type, the decoration being largely confined to geometrical patterns to the exclusion of motives derived from plant forms. This is usually known as the geometrical style, and the pottery covers the period from about 1000 to 700 B.C. It is found all over the mainland and islands of Greece, and exhibits a certain development towards a more advanced stage. The patterns include the chevron, the triangle, the key or meander, and the circle, in various combinations, painted in dull black on a brown ground. In most places the art advanced no further, but in Boeotia, and still more at Athens, we can trace the gradual growth of decorative skill, first in the introduction of animals, and then in the appearance of the human figure. In the Athenian cemetery outside the Dipylon gate a series of colossal vases has come to light, on which are painted such subjects as sea-fights and funeral processions. The human figures are exceedingly rude and conventional, painted almost entirely in silhouette, but there is a distinct striving after artistic effect in the composition and arrangement. In Boeotia the vases do not advance beyond the animal stage, and many exhibit a tendency to decadence in their carelessness, as contrasted with the painstaking helpfulness of the Athenian artists.

In Ionia and the islands of the Aegean such as Rhodes, the art of vase-painting from the first carried on the Mycenaean tradition, and was distinguished by its naturalism and originality, and by the bold and diverse effects produced by variety of colour or novelty of subject. The ornamentation is at first elementary, consisting of friezes of animals, especially lions, deer and goats (figs. 23 and 24). These figures stand out sharply in black against the creamy buff ground which is characteristic of nearly all Ionic pottery, and details are brought out by means of engraved lines, patches of purplish iron pigment, or by drawing parts of the figures, especially the heads, in outline on the clay ground. Another feature is the general use of small ornaments such as rosettes and crosses in great variety of form to cover

the background and avoid the vacant spaces which the Greek artist abhorred. The system of decoration has been thought to owe much to Assyrian textile fabrics.

One of the best though most advanced examples of early Ionic pottery is a pinax or plate from Rhodes in the British Museum, on which is represented the combat of Menelaus and Hector over the body of Euphorbus (fig. 25); their names are inscribed over the figures, and this is almost the earliest known instance of a mythological subject, the date of the painting being not later than 600 B.C. To a slightly later date belongs another remarkable group of cups with figures on a white ground, probably made at Cyrene in North Africa. Of these the most famous has a painting in the interior, of Arcesilaus II., king of Cyrene from 580 to 550 B.C., weighing goods for export in a ship. Others have mythological subjects, such as Zeus, Atlas and Prometheus, Cadmus and Pelops.

But these vases, though still retaining the older technique, really belong to the second class, that of black-figured vases, and they belong to a time when in all Ionic centres this method was being superseded by the new technique which Corinth had introduced and Athens perfected, to the consideration of which we must return.

For some 150 years Corinth almost monopolized the industry of pottery on the west of the Aegean. Large numbers of examples have been found in or near the city itself, many bearing inscriptions in the peculiar local alphabet. They show a continuous progress from the simplest ornamentation to fully-developed black-figured wares. In the earliest (Plate I. fig. 52) oriental influence is very marked, the surface being so covered with the figures and patterns that the background disappears and the designs are at times almost unintelligible. The general effect is thus that of a rich oriental tapestry, and the subjects are largely chosen from the fantastic and monstrous creations of Assyrian art, such as the sphinx and griffin. The vases are mostly small, the ground varies from cream to yellow, and the figures are painted in black and purple.

Both in Ionia and at Corinth during the early part of the 6th century the same tendencies are seen to be at work, tending to a unification of styles under the growing influence of Athens. In Ionia (see above) figure subjects become more common, and the technique approaches gradually nearer to the black-figure method. Similarly at Corinth the ground ornaments diminish and disappear, the friezes of animals are restricted to the borders of the designs, and human figures are introduced, first singly, then in friezes or groups, and finally engaged in some definite action such as combats or hunting scenes. In the last stages Greek myths and legends are freely employed. A new development, traditionally associated with the painter Eumarsus of Athens, was the distinguishing of female figures by the use of white for flesh tints. A somewhat similar development was in progress at Athens, though represented by comparatively few vases. Here the adoption of Corinthian and Ionian technical improvements evolved by the middle of the 6th century the fully developed black-figure style which by degrees supplanted or assimilated all other schools.

II. Black-figured Vases.—At the head of this new development stands the famous François vase at Florence, found at Chiusi in 1844 (Plate I. fig. 53). Its shape is that of a krater or mixing-bowl, and it bears the signatures of its maker and decorator in the form "Ergotimos made me, Klitiadas painted me." It might be described as a Greek mythology in miniature, with its numerous subjects and groups of figures all from legendary sources such as the stories of Peleus, Theseus and Meleager, or the return of Hephaestus to heaven. All the figures have their names inscribed.

The general technique of the black-figured vases has already been described. It may be noted as a chronological guide that the use of purple for details is much commoner in the earlier vases, white in the later, but towards the end of the century when the new fashion of red figures was gaining ground, both colours were almost entirely dropped. The drawing of the figures is, as might be expected, somewhat stiff and conventional, though it advanced considerably in freedom before the style went out of fashion. Many vases, otherwise carefully and delicately executed, are marred by an excess of mannerism and affectation, as in the works of the artists Amasis and Eukleides (Plate I. fig. 54). The treatment of drapery is a good indication of date, ranging from flat masses of colour to oblique flowing lines of angular falling folds.

The shapes most commonly employed by the Athenian potters of this period are the amphora, hydria, kylix,oinochoe and lekythos, the first-named being the most popular. A special class of amphora is formed by the Panathenaic vases, which were given as prizes in the Athenian games, and were adorned with a figure of the patron goddess Athena on one side and a representation of the contest in which they were won on the other (fig. 26). They usually bear the inscription των Ἀθηναίων θαλάτων εἰς, "I am (a prize) from the games at Athens." Some of these can be dated by the names of Athenian archons which they bear, as late as the 4th century, the old method of painting in black figures with a stiff conventional pose for the goddess being retained for religious reasons.

The chief interest of the black-figured vases is really derived from their subjects, which range over every conceivable field, the proportion of myth and legend to scenes from daily life being much greater than in the succeeding period. They include groups of Olympian and other deities, and the various scenes in which they take part, such as the battle of the gods and giants, or the birth of Athena (treated in a very conventional manner, as on a fine amphora in the British Museum); Dionysus and his attendant satyrs and maenads, the labours and exploits of Heracles and other heroes, subjects taken from the tale of Troy and other less familiar legends; and scenes from daily life, battle scenes, athletics, the chase and so on. The same classification of course holds good for the later periods of vase-painting, with some exceptions. The proportion of genre-scenes subsequently becomes greater, and some myths disappear, others rise

CERAMICS

The artist Andocides, who not only produced vases in each method, but also several in which the two are combined (fig. 27). In two or three cases the subject is actually the same on each side, almost every detail being repeated, except that the colouring is reversed.

The date at which the change took place was formerly placed well on in the 5th century, on account of the great advance in drawing which most of the red-figured vases show, as compared with the black. They were thus regarded as contemporary with the painter Polyclitus, if not with Phidias. But the excavations on the Acropolis of Athens yielded so many fragments in the advanced red-figured style which must be earlier than 480 B.C., that it has become necessary to find an earlier date for its appearance. This is now usually placed at about 520 B.C., overlapping with the preceding period.

The red-figured period is usually subdivided into four, marking the chief stages of development, and known respectively as the "severe," "strong," "fine," and "late fine" periods. Their principal characteristics and representative painters may be briefly enumerated.

The "severe" period there is no marked advance on the black-figured vases as regards style. The figures are still more or less stiff and conventional, and some vases even show signs of an analogous decadence. The real development is partly technical,
made by Cachrylion, who stands on the verge of the succeeding stage. The strong period centres round the name of Euphronioi, the author of a really great artistic movement. His capacity for inventing new subjects or new poses—or otherwise overcoming technical and artistic difficulties—marks a great advance on all previous achievements, and he seems to represent the stage of development traditionally associated with the painter Cimon of Cleonae, the inventor of foreshortening and other novelties. Thus figures were no longer represented exclusively in profile, as in the black-figured vases which had made no advance beyond the conventions of Egyptian art. Ten vases signed by him are in existence (though it is not certain that all were actually painted by him), most of them having mythological subjects (fig. 28).

Of his contemporaries, Duris, Hieron and Brygos take foremost rank, all three being, like Euphronioi, essentially cup-painters, though they use other forms at times. For decorative effect and beauty of composition their vases have never been surpassed. As an example we may quote a kotyle or beaker in the British Museum signed by Hieron, with a group of Eleusinian deities. The larger vases of this period are more rarely signed, but many of them rival the cups in execution, though the subjects are characterized by greater simplicity and largeness of style.

In the fine style (460-440 B.C.) breadth of effect and dignity are aimed at, and although cup-painting had passed its zenith, and signed specimens become rarer, yet, considering the red-figured vases as a whole, this period exhibits the perfection of technique and drawing. In many of the larger vases the scenes are of a pictorial character, landscape being introduced, with figures ranged at different levels, and herein we may see a reflection of the style of the painter Polygnotus. One of the finest cups in this style is in the Berlin Museum, it is signed by the artists Erginos and Aristophanes, and the subject is the battle of the gods and giants. To the end of the period belongs a beautiful hydria in the British Museum by the painter Melidas with subjects from Greek legend in two friezes (fig. 29). Generally speaking, there is a reaction in favour of mythological subjects.

In the late fine style, which begins about 440 B.C., the pictorial effect is preserved, but with perfected skill in drawing the compositions deteriorate greatly in merit, and become at once over-refined and careless. The figures are crowded together without meaning or interest. The fashion also arose of enhancing the designs by means of accessory colours—almost unknown in the previous stages—such as white laid on in masses, blue and green, and even with gilding. Athletic and mythological subjects yield place to scenes from the life of women and children or meaningless groups of figures (fig. 30).

A good example of this style is an amphora from Rhodes with the subject of Peleus wooing Thetis, in which polychrome colouring and gilding are introduced. There are also many imposing and elaborate specimens found (and perhaps made) in the colonies of the Crimea and the Cyrenaica; in particular one signed by Xenophon with the Persian king hunting, and another representing the contest of Athena and Poseidon for the soil of Attica, both from the Crimea.

Contemporary with the red-figure method is one in which the figures are painted on a white slip or enkebe resembling pipeclay, with which the whole surface was covered; the figures are drawn in outline in red or black, and partly filled in with washes of colour, chiefly red, purplish red, or brown, but sometimes also with blue or green. This style seems to have been popular about the middle of the 5th century B.C. and was employed for the funeral lekythoi which came into fashion at Athens about that time. These vases, which form a class by themselves, were made specially for funeral ceremonies and were painted with subjects relating to the tomb, such as the laying-out of the corpse on the bier, the ferrying of the dead over the Styx by Charon, or (most frequently) mourners bringing offerings to the tomb (fig. 31). They continued to be made well into the 4th century, but the later examples are very degenerate and careless.

Of these forms, especially the kylikes and the pyxides (toilet-box), some exceedingly beautiful specimens have come down to us, which show a delicacy of drawing and firmness of touch never surpassed, although the lines were probably only drawn with a brush. The technique of these vases may reflect the methods of the painter Polygnotus and his contemporaries, who used a
limited number of colours on a white ground. Among them no finer specimen exists than the cup in the British Museum with Aphrodite riding on a goose; the design is entirely in brown outlines, and the drawing, if slightly archaic, full of grace and refinement.

In the subjects on red-figured vases we do not find the same variety of choice as on the black-figured, but on the other hand there is infinitely greater freedom of treatment. The stereotyped form of composition is almost entirely discarded, and each painter forms his own conception of his subject. The class of slim amphi- 

Fig. 30.—Painting from a small toilet-box or pyxis, showing painted vases used to decorate a lady’s room. On the left is a gilt pyxis with a tall lid, and an oenochoe on a low table; on the right two tall vases (lebes) on a plinth. All except the pyxis are decorated with painted figures, and contain flowers.

Architectural details. Yellow is introduced for details of hair or features, and in attempts at shading, nor is a dull iron-purple uncommon. The reverses of the vases, when they have subjects, are devoid of all accessory colouring, and the figures are drawn with the greatest carelessness, as if not intended to be seen. There is throughout a lavish use of ornamental patterns such as palmettes, wreaths of leaves, or ornaments strewn over the field (a reversion to an old practice). The drawing, having now become entirely free, errs in the opposite extreme; the forms are soft and the male figures often effeminate. The fanciful and richly-embroidered draperies of the figures and the frequent architectural settings seem to indicate that theatrical representations exercised much influence on the vase-painters. The great painters of the 4th century may also have contributed their share of inspiration, but rather perhaps in the subjects chosen than in regard to style; though the effect of many scenes on the larger vases is decidedly pictorial, they are chiefly remarkable for their emotional and dramatic themes.

The influence of the stage is twofold, for tragedy as well as comedy plays its part. Many subjects are taken directly, others indirectly, from the plays of Euripides, such as the Medea, Hecuba (Plate II. fig. 60), or Hercules Furens, and the arrangement of the scenes is essentially theatrical. The influence of
comedy is seen in subjects derived from the *phlyax*, a kind of farce or burlesque popular in southern Italy, and here again the setting is adapted from the stage, some vases having parodies of myths, others comic scenes of daily life.

Many vases of this period, especially those of large size, were expressly designed for funeral purposes. Some of these bear representations of the underworld, with groups of figures undergoing punishment. On other vases or tombs are depicted—sometimes containing effigies of the deceased, at which the relatives make offerings—as on the Athenian *leythoi*. But by far the greater portion of the subjects are taken from daily life, many of these being of a purely fanciful and meaningless character like the designs on Sévres or Meissen china; the commonest type is that of a young man and a woman exchanging presents, the presence of Eros implying that they are scenes of courtship. The vases of this period are usually grouped in three or four different types, corresponding to the ancient districts of Lucania, Campania and Apulia, each with its special features of technique, drawing and subject.

In Lucanian vases the drawing is bold and restrained, more akin to that of the Attic vases; in Campania a fondness for polychromy is combined with careless execution. In Apulia a tendency to magnificence exemplified in the great funeral and theatrical vases is followed by a period of decadence characterized by small vases of fantastic form with purely decorative subjects. Besides these we have the school of Paestum, represented by two artists who have left their names on their vases, Assteas and Python. A well-known example of the work of the former is a *krater* in Madrid with Hercules destroying his children, a theatrical and quasi-grotesque composition, and there is a fine example of Python’s work in a *krater* in the British Museum, with Alkmene, the mother of Hercules, placed on the funeral pyre by her husband Amphitryon, and rain-nymphs quenching the flames (Plate 1, fig. 35).

About the end of the 3rd century B.C. the manufacture of painted vases would seem to have been rapidly dying out in Italy, as had long been the case elsewhere, and their place is taken by unpainted vases modelled in the form of animals and human figures, or ornamented with stamped and moulded reliefs. These in their turn gave way to the Arretine and so-called “Samian” red wares of the Roman period. In all these wares we see a tendency to the imitation of metal vessels, which, with the growth of luxury in the Hellenistic age, had entirely replaced painted pottery both for use and ornament; the pottery of the period is reduced to a subordinate and utilitarian position, merely supplying the demands of those in the humbler spheres of life.

Collections.—The majority of the painted vases now in existence are to be found in the various public museums and collections of Europe, of which the largest and most important are the British Museum, the Louvre and the Berlin Museum. Next to these come the works at Athens, Naples, Munich, Vienna, Rome and St. Petersburg; isolated specimens of importance are to be found in other museums, as at Florence, Madrid or the Bibliothèque Nationale at Paris. Most of the great private collections of the two preceding centuries have now been dispersed. In recent years the Boston Museum has raised America to a level with Europe in this respect; and the Metropolitan Museum at New York contains a vast collection of Cypriot pottery.

**ETRUSCAN POTTERY.**—Parallel with the development of the art of pottery in Greece runs the course of the art in Etruria, though with far inferior results; in its later stages it is actually no more than a feeble imitation of the Greek. The period of which we must consider extends from the Bronze age (1000 B.C. or earlier) down to the 3rd century B.C., when Etruscan civilization was merged into Roman.

The earliest civilization traced in Italy is not, strictly speaking, Etruscan, but may perhaps be more accurately styled “Umbrian.” It is usually referred to as the “Terramare” period from the remains discovered in that district in the basin of the Po. These people were lake-dwellers, barely removed from the Neolithic stage of culture, and their pottery was of the rudest kind, hand-made and roughly baked. Cups and pots have been found sometimes with simple decoration in the form of knobs or bosses, and many have a crescent-shaped handle serving as a support for the thumb.

The next period, the earliest which can be spoken of as “Etruscan,” is known as the “Villanova” period from a site of that name near Bologna, or as the period of pit-tombs (a *pese*), from the form of the graves in which the pottery has been found (see Villanova). It begins with the 7th century B.C. and lasts for about two hundred years. The pit-tombs usually contain large cinerary urns or ossaria (containing the ashes of the dead), fashioned by hand from a badly-levigated volcanic clay known as *imposto Italic*. These vessels were irregularly baked in an open fire, and the colour of the surface varies from red-brown to greyish black. They appear to have been covered with a polished slip, intended to give the vases a metallic appearance. The shape of the urns is peculiar, but uniform; they have a small handle at the widest part and a cover in the form of an inverted bowl with handle (Plate III. fig. 62). Their ornamentation consists of incised or stamped geometrical ornaments formed in the moist clay in bands round the neck and body; more rarely patterns painted in white are found. Common pottery is also found showing little advance on that of the Terramare.
period except in variety of decoration. The technique and ornament are the same as in the case of the urns. They correspond in development, though not in date, to the early pottery of Troy and Cyprus, as well as to the primitive pottery of other races, but one marked difference is the general fondness of the Italian potter for vases with handles.

Sometimes the cinerary urns take the form of huts (tuguria), though these are more often found in the neighbourhood of Rome. One of the best examples is in the British Museum; it still contains ashes which were inserted through a little door secured by a cord passing through rings. The ornamentation suggests the rude carpentry of a primitive hut, the cover or roof being vaulted with raised ridges to represent the beams. The surface is polished, and other specimens are occasionally painted with patterns in white.

In the next stage a change is seen in the form of the tombs, the pit being replaced by a trench; this is accordingly known as the "trench-tomb" or a fossa period, and extends from the 8th century B.C. to the beginning of the 6th. Importations of Greek pottery now first make their appearance. The character of the local pottery actually remains for some time the same as that of the preceding period, but it improves in technique. By degrees the paste of the fossa is also noted, and new varieties of ornamentation are introduced; there is, however, no evidence that the wheel was used.

Two entirely new classes of pottery are found at Cervetri (Caere) belonging to the 7th century. One consists of large jars (zilbo) of red ware, the lower part being moulded in ribs, while the upper has bands of design stamped round it in groups or friezes. These designs were either produced from single stamps or rolled out from cylinders like those used in Babylonia.

The subjects are usually quasi-oriental in character, and it is not certain that this ware was made in Etruria, especially as similar vases have been found in Rhodes and Sicily; either it was imported, or it was a local imitation of Greek models.

The other class is similar as regards the shapes and the nature of the clay, but is distinguished by having painted subjects in white outlines on a red glossy ground. The clay, a kind of impasto Italico, was first hardened by baking, and then a mixture of wax, resin and iron oxide was applied and polished; on this the pigments, a mixture of chalk and earth, were laid. The subject, if not based on Greek mythology or at least Greek in character, but the technique is purely Etruscan, and the drawing is crude and un-Greek in the extreme.

The fourth period shows a close continuity with the third; but the difference is defined firstly by the appearance of a new type of tomb in the form of a chamber (a camera), secondly, by the all-pervading influence of oriental art, and to a less extent of that of the Greeks. The period extends from about 650 to 550 B.C., and is further marked by the general introduction of the wheel into Etruria and by the appearance of inscriptions in an alphabet derived from western Greece. In the earlier tombs the typical local pottery is of hand-made impasto Italico resembling that of the previous periods; in the later we find what is known as bucchero ware—the national pottery of Etruria—which is made on the wheel and baked in a furnace, and shows a marked tendency to imitate metal.

To this period also belongs the famous Polledrara tomb or Grotto d’Iside at Vulci, the contents of which are now in the British Museum and include some remarkable specimens of pottery. It dates from about 620-610 B.C. The most remarkable of the vases is a hydria of reddish-brown clay covered with a lustrous black slip on which have been painted designs in red, blue and a yellowish white. The colours have unfortunately now almost disappeared, and it is doubtful if they had been fired. The principal subject is from the story of Theseus and Ariadne. This tomb also contained a large wheel-made pitkos of red impasto ware with designs painted in polychrome. In the Regolini-Galassi tomb at Cervetri (about 650 B.C.) large caddrons of red glossy ware were found, with gryphons' heads projecting all round, to which chains were attached. A similar caddron from Falerii on a high open-work stand is now in the British Museum.

We now come to the bucchero ware, which is characteristic of the later portion of this period, though the earliest examples go back to the end of the 7th century. Its main feature is the black paste of which it is composed, covered with a more or less shining black slip. Modern experiments seem to indicate that the clay was smoked or fumigated in a closed chamber after baking, becoming thereby blackened throughout, and the surface was then polished with wax and resin. Analyses of the ware have proved that it contains carbon and that it had been lightly fired. The oldest bucchero vases are small and hand-made, sometimes with incised geometrical patterns engraved with a sharp tool like metal-work. Oriental influence then appears in a series of chalice-shaped cups found at Cervetri with friezes of animals. From about 560 B.C. onwards the vases are all wheel-made, with ornaments in relief either stamped from a cylinder or composed of separate medallions attached to the vase. The subjects range from animals or monsters to winged deities or supplicants making offerings (fig. 34); in other cases we find meaningless groups of figures or plant forms. These types are found chiefly in southern Etruria, but at Chiusi (Clasium) a more elaborate variety found favour from about 500 to 450 B.C. The shapes are very varied and the ornament covers the vase from top to bottom, the covers of the vases being also frequently modelled in various forms. The figures are stamped from moulds, incised designs being added to fill up the spaces. The range of subjects is much widened, including scenes from Greek mythology and oriental types combining Egyptian and Assyrian motives, which must have been introduced by the Phoenicians.

Thus the technique of the bucchero wares is purely native, but the decoration is entirely dependent on foreign types whether Greek or oriental, and throughout the whole series the tendency to imitate metal-work is to be observed in every detail, whether in the forms and in the methods of decoration. Some are mere counterparts of existing work in bronze.

The last variety of peculiarly Etruscan pottery which calls for notice is the Canopic jar, so called from its resemblance to the kárrwos in which the Egyptians placed the bowls of their mumiforms. They are rude representations of the human figure, the head forming the cover, and in the vases were placed on round chairs of wood, bronze or terra-cotta. An example of such a jar on a bronze-plated chair may be seen in the Etruscan Room of the British Museum (Plate III, fig. 65). Their origin has been traced to the funeral masks found in the earliest Etruscan tombs. From these a gradual transition may be observed from the mask (1) placed on the corpse, (2) on the cinerary urn, (3) the head modelled in the round and combined with the vase, and (4) at last the complete human figure. The earliest of these jars are found in the 7th and 6th centuries, the 6th and 5th centuries, and the latest and most developed types belong to the 5th century B.C.

The skill shown by the Etruscans in metal-work and gem-engraving never extended to their pottery, which is always purely imitative, especially when they attempted painted vases after the Greek fashion. The kinds already described are all more or less plastic in character and imitative of metal, except in the case of the Cervetri and Polledrara finds, which have little in common with anything Greek, and exhibit a quite undeveloped art. But towards the end of the 6th century B.C., when Greek vases were coming into the country in large numbers, attempts were made to
imitate the black-figure style, especially of a particular class of Ionian vases. Imitations of these are to be found in most museums and may be readily recognized as Etruscan from peculiarities of style, drawing and subject, as well as their inferior technique (fig. 35).

At a later date (4th-3rd century B.C.) they began to copy red-figured vases with similarly unsuccessful results. With the invention of the potter's wheel a small class of somewhat ambitious character was made at Falerii (Civita Castellana), of which there is a good example in the British Museum with the subject of the infant Hercules strangling the serpents, they are all marked by their inferior material and finish and their bizarre decoration. The style is often repulsive and disagreeable, as well as ineffective, and the grim Etruscan deities, such as Charun, are generally introduced. Some of these vases have painted inscriptions in the Etruscan alphabet. The latest specimens positively degenerate into barbarism.

Painted vases of native manufacture are also found in the extreme south of Italy and have been attributed to the indigenous races of the Peucetians and Messapians; their decoration is partly geometrical, partly in conventional plant forms, and is the result of natural development rather than of imitation of Greek types. Some of the shapes are characteristic, especially a large four-handled krater. They cover the period 600-450 B.C., after which they were ousted by the Graeco-Italian productions we have already described.

ROMAN POTTERY.—Roman vases are far inferior to Greek; the shapes are less artistic, and the decoration, though sometimes not without merits of its own, owes most of its success to the imitation or adaptation of motives learnt from earlier Greek, Egyptian or Syrian potters. They required only the skill of the potter for their completion, and, being made by processes largely mechanical, they are altogether on a lower scale of artistic production.

It has been noted that during a certain period—namely, the 3rd and 2nd centuries B.C.—ceramic art had reached the same stage of evolution all round the Mediterranean, painted pottery had been ousted by metal-work, and such vases as continued to be made were practically imitations of metal both in Greece and Italy. These latter we must regard as representing ordinary household pottery, or as supplying to those who could not afford to adorn their houses and temples with costly works in metal, a humble but fairly efficient substitute. There is a terra-cotta bowl of the 2nd century B.C. in the British Museum which is an exact replica of a chased silver bowl with reliefs in the same collection, and may serve as an illustration of this condition of things (Plate II. fig. 56).

These imitations of metal were largely made in southern Italy, a district which enjoyed close artistic relations with Etruria, and we have already seen that the same principle had long been in vogue among the Etruscans. Hence it is not surprising that an important centre of pottery manufacture should have sprung up in Etruria, in the 2nd century B.C., which for many years set the fashion to the whole Roman world. But before discussing such products it may be as well to say something on the technical character, shapes and uses of Roman pottery in general.

Technical Processes.—Roman pottery regarded in its purely technical aspect is in some ways better known to us than the Greek, chiefly owing to extensive discoveries of kilns and potters' apparatus in western Europe. It may be classified under two heads, of which only the former will concern us for the most part as yielding by far the greater amount of material and interest: (1) the plain, dull earthenware used for domestic purposes, and (2) the fine, red shining wares, usually known to archaeologists as terra sigillata, that are received in stamps (sigillata) or impressions.

For both classes all kinds of clay were used, varying somewhat in different regions, and ranging in colour when fired from black to grey, drab, yellow, brown and red. The clays varied greatly in quality; most of the pottery made in southern Gaul was fashioned from the terracota clay of the Aix district, but in the North a common clay and in that neighbourhood a white clay was used. In Italy we find a carefully levigated red clay in use, great care being devoted to its preparation and admixture. But apart from decoration and style there is a great similarity between the Italian and provincial pottery made under Roman influence, and it is often very difficult to decide whether the vases were manufactured where they had been found or were imported from some famous centre of manufacture. The secret of the glossy red surface seems to have been common property and found its way from Italy to Gaul, Spain and Germany, and perhaps even to Britain.

The manner in which this glossy red surface was produced has been a much disputed question, some, as for instance Artis, the excavator of the Castor potteries in Northamptonshire, claiming that it was a natural result obtained in the baking, after polishing of the surface, by means of specially contrived kilns. But it is now fairly generally agreed that the Romans used wooden stamps and many of the commoner wares have a gloss produced by polishing only, varying in colour and brightness with the proportion of iron oxide in the clay and the degree of heat at which the pieces were fired. But the surface finish of the finer or terra sigillata wares is something quite different, and reaches a high and wonderfully uniform perfection.

It is possible that the technical secret of the potters of the Roman world was only a development from the practice of the Greeks, but it is certain that the greatest results were obtained at the time when, as in fashionable Alpine ware, the brilliant and lusty glosses were obtained by baking so thin as to defy analysis, yet so persistent as to leave no doubt of its existence as a definite glossy coat. Repeated attempts have been made to determine its nature by analysis, but it is certain that to have any hope of reaching the truth in that line it is impossible to remove it without detaching much more body than glaze. Examination shows it to be much more than a surface polish or than the gloss of the finest Greek vessels, and we shall have to wait for a final determination of its nature, if we are to be certain that once a chemist and a potter can reconstruct them synthetically. Whatever its nature and method of production, it is certain that the glaze itself was a transparent film which heightened the natural red colour of the clay, until in the finest specimens it has something of the quality of red enamel.

In the manufacture of vases the Romans used the same processes as the Greeks. They were all made on the wheel, except those of abnormal size, such as the large caskets ( dolia), which were built up on a frame. The potters were generally supplied with the stamps and moulds by the potters of Areezzo and Nancy, made of terra-cotta, with a pierced centre for the pivot, and bearing small cylinders of lead round the circumference to give a purchase for the hand and to aid the momentum of the wheel. Before the final form was reached an additional process was necessary, and the decoration was in nearly all cases produced from moulds. The process in this case was a threefold one: first the stamps had to be made bearing the designs; these were pressed upon the inside of a clay mould which had been previously made on the wheel to the size and shape required; finally, the clay was pressed in the mould and the vase was thus produced, decoration and all. Handles being of rare occurrence in Roman pottery, the projecting hollows for their accommodation required the enlargement of the mould, and this was only the addition of rim and foot. The stamps were made in various materials, and had a handle at the back (Plate III. fig. 64). The moulds were of lighter clay than the vases, and were lightly fired in a kiln to set them hard; so a form was moulded into the press moulded clay. Large numbers of these moulds are in existence (Plate III. fig. 61), and the British Museum possesses a fine series from Areezzo. Those discovered in various parts of Gaul have afforded valuable evidence as to the sites of the various kilns, and have obviously denoted a place of manufacture, and the value of this evidence is increased when they bear potter's names.

Remains of kilns for baking Roman pottery1 are very numerous in western Europe, especially in Gaul, where the best examples are at the Carlsviller Château near Epernay; Cléon in Lot-et-Garonne, and near Agen in Lot-et-Garonne. In Germany good remains have come to light at Heiligenberg in Baden, at Heidenheim near Frankfort, Rheinzabern near Carlshue, and Westerndorf in Bavaria. In England the best kilns are those discovered by Artis in 1821-1827 at Castor in Northamptonshire (see fig. 4).

Shapes.—As is the case with Greek vases, a long list of names of

1 For a full description and lists of such kilns see Walters, Ancient Pottery, ii. 443-454.
shapes may be collected from Latin literature, and the same difficulties as to identification arise in the majority of cases. They may, however, be classified in the same manner; as vessels for storing liquids, for mixing or pouring wine, for use at the table, and so on. In addition Varro and other writers have preserved a number of archaic and obscure names chiefly applied to the vessels used in sacrifices.

The principal vessels for storing liquid or solid food were:—The dolium, or large earthenware jar for holding about six gallons; and the calyx, a jar about half as large as the amphora. The dolium had no foot, and was usually buried in the earth; it was also used for purposes of burial. The amphora corresponded with the dolium in shape, but was intended for exportation. The calyx is a pointed base. Many examples were found at Pompeii, stamped with the names of consuls (cf. Hor. Od. iii. 21, 1), or with painted inscriptions relating to their contents. The calyx is mentioned by Horace and Martial.

The vases for holding liquids, such as jugs, bottles and flasks, the principal were the areus, answering to the Greek oikyn, the ampulla, a kind of flask with globular body, and the lageno, a narrow-necked flask or bottle. Of drinking-cups the Romans had almost as large a variety as the Greeks, and the great majority of the ornamented vessels preserved to the present day were devoted to this purpose. The generic name for a cup was poculum, but the Romans borrowed many of the Greek names, such as cistaria and scyphs. The calix appears to have answered in popularity, though not in form, to the Greek kylix, and is probably the name by which the ornamented bowls were usually known. The names for a dish are laren, potina and calixus. Another common form is the olla (Greek xyló), a small open vessel purposed for cooking on a fire, and answered, for a jar in which money was kept, or for a cinerary urn. The form of vase identified with this name has a spherical or ovoidal body with short neck and wide mouth. Of sacrificial vessels the principal was the patera or libation-bowl, corresponding to the Greek akroterion.

Arretine Ware.—The Latin writers, and in particular Pliny, mention numerous places in Italy, Asia Minor and elsewhere, which were famous for the production of pottery in Roman times. Pliny mentions with special commendation the "Samian Ware," (Arcezio). Samian pottery is also alluded to by other writers, and hence the term was adopted in modern times as descriptive of the typical Roman red wares with reliefs, whether found in Italy, Germany, Gaul or Britain. But it was only accepted with diffidence as a convenient name, and as early as 1840 discoveries at Arcezio made it possible to distinguish the vessels found there as a local product, now known as "Arretine" ware. The name "Samian" has, however, adhered to the provincial wares and at the present day is often used even by archaeologists. But recent researches have shown that nearly all the provincial wares can be traced to Gaulish or German potteries, and, since it is implied by Pliny that "Samian" pottery is older than "Arretine," the name may now be fairly rejected altogether, as we have rejected the name "Etruscan" for Greek pottery. The Romans probably used it as a generic term, just as we speak of "china," and the real Samian ware is to be seen in the later Greek pottery, with reliefs, of the 3rd century B.C.

There were, as Pliny and other writers imply, many pottery centres in Italy, at Rhegium, Cumae, Mutina and elsewhere, as well as at Saguntum in Spain, but all were surpassed in excellence by Arcezio. In more modern times its pottery came into use in the Middle Ages, and discoveries were made in the time of Leo X. (about 1500) and again in the 18th century. The Arretine ware may be regarded as the Roman pottery par excellence, and its popularity extended from about 150 B.C. down to the end of the 1st century of the Empire, reaching its height in the 1st century B.C., after which it rapidly degenerated, and its place was taken by the wares of the provinces. Its general characteristics may be summed up as follows:—(1) The fine local red clay, carefully levigated and baked very hard to a rich coral red or a colour like sealing-wax; (2) the fine red glaze, which has already been discussed; (3) the great variety of forms employed, showing the marked influence of metal-work; (4) the almost invariably presence of stamps with potters' names. The majority of the specimens have been found at Arcezio itself, but there was a branch of the industry at Puteti, producing pottery almost equal in merit, and it was also exported to central and eastern Europe and Spain.

The earliest examples are of black glossy ware, but the red appears to have been introduced by 100 B.C., when the first potters' stamps appear. These are usually quadrangular in form, though other shapes are found, and are impressed in the midst of the design on the ornamented vessels, or on plain wares on the bottom of the interior. The number of potters' names is very large, though some appear to have been more prolific than others, and to have employed a large number of slaves, whose names appear with their masters' on the stamps. The best known is Marcus Perenius, whose wares take highest rank for their artistic merit, the designs being copied from good Greek models. He employed seventeen slaves, of whom the best known is Tigranes, the stamps usually appearing as M-PEREN AND TIGRAN. The slate-name of Bargates is found on one of his finest vessels, in the Boston Museum, the subject being the fall of Phaethon. We may suppose that the stamps for the figures were designed by the masters, but that the vessels were actually moulded by the slaves. Other important artists are Calidius Strigo, who had twenty slaves; P. Cornelius, who had no less than forty; Aulus Titius, who signed himself A.TITI-PIGVL-AKKO; the Adygam and the Tetii; and L. Rasinus Pisanus, a degenerate potter of the Flavian period, who imitated Gaulish wares.

The forms of the wares are all, without exception, borrowed from metal shapes and are of marked simplicity (see fig. 37, Nos. 1, 8, 9, 11). They are mostly of small size and devoid of handles, but a notable exception is a bell-shaped krater or mixing-bowl, of which there is a very fine example in the British Museum, found at Capua and decorated with the four seasons (Plate III. fig. 62). For the decoration and subjects the potters undoubtedly drew their inspiration from the "new Attic" reliefs of the Hellenistic period, of which the krater just cited is an example. So, too, are such subjects as the dancing maenads or priestesses with wicker head-dresses, or the Dionysiac scenes which are found, for instance, on the vases of Perenius. Others again are distinguished by a free use of conventional ornament, figures when they occur being merely decorative. There is throughout a remarkable variety both in the ornamentation and in the methods of composition.

Provincial Wares.—The Arretine ware, as has been noted, steadily degenerated during the 1st century of the Empire, and the manufacture of ornamental pottery appears to have entirely died out in Italy by the time of Trajan. Its place was taken by the pottery of the provinces, especially by that of Gaul, where the transference of artistic traditions led to the rise of new industrial centres in the country bordering on the Rhone and the Rhine.

As to the general characteristics of the provincial wares, that is, of the ornamented wares of terra sigillata, the clay is fine and close-grained, harder than the Arretine, and when broken shows a light red fracture; the surface is smooth and histruous, of a brighter yet darker red colour (i.e. less like coral) than that of Arretine ware, but the tone varies with the degree of heat used. The most important feature is the fine glaze with which it is coated, similar in composition to that of the Arretine; it is exceedingly thin and transparent, and laid equally over the whole surface, only slightly brightening the color of the clay. The ornament is invariably applied after that of Arretine ware, by which, however, it is indirectly inspired.

The vessels are usually of small dimensions, consisting of various types of bowls, cups and dishes, of which two or three forms are preferred almost to the exclusion of the rest, and they frequently bear the stamp of the potter impressed on the inside or outside. Although this ware is found all over the Roman world, by far the greater portion comes from Gaul, Germany or Britain, and evidence points to two—and only two—districts as the principal centres of manufacture: the valleys of the Loire and the Rhine and their immediate neighbourhood. In the 1st century A.D. Gaulish pottery was largely exported into Italy, and isolated finds of it occur in Spain and other parts.

The recent researches of Dr Drage:sand and M. Déchelette have shown that a chronological sequence of the pottery may be clearly traced, both in the shapes employed and in the method of
CERAMICS

merit or importance. The early Rhenish wares are, strictly speaking, of a semi-Celtic or Teutonic character, while the later German terra sigillata, for which the principal centres were Rheinzabern near Karlsruhe and Westerndorf in Bavaria, are of similar character but inferior to the 2nd-century pottery of Lezoux. A mould from Rheinzabern is illustrated, Plate IV, fig. 66.

The ornamented vases produced in these potteries are, as we have said, almost confined to two or three varieties, which follow one another chronologically. A shape favoured at first is the krater, which has been mentioned as one of the characteristic Arretine forms; but this enjoyed but a short term of popularity. Early in the 1st century we find a typical form of bowl in use, which, following the numeration of Dr Dragendorff’s treatise, is usually spoken of as No. 29. This is characterized by its moulded rim engraved with finely incised hatchings, and by the division of the body by a moulding into two separate friezes for the designs (fig. 36). Its ornament is at first purely decorative, consisting of scrolls and wreaths, then small animals and birds are introduced, and finally figure subjects arranged in rectangular panels or circular medallions. About the middle of the century a second variety of bowl (known as No. 30; see fig. 37) was introduced; this is cylindrical in form, and, being found both at Graufesenque and Lezoux, may be regarded as transitional in character. In the latter half of this century a new form arises (No. 37; fig. 37), a more or less hemispherical bowl which holds the field exclusively on all sites down to the termination of the potteries. In this form and in No. 30 a new system of decoration is introduced, the upper edge being left quite plain. The panels and medallions at first prevail, but are then succeeded by arcading or inverted semicircles enclosing figures, and finally after the end of the 1st century (and on form 37 only) we find the whole surface covered with a single composition of figures unconfined by borders or frames of any kind, but in a continuous frieze; this is known as the “free” style (Plate IV, fig. 66).

As regards the figure subjects, it may be generally laid down that the conceptions are good, but the execution poor. Many are obvious imitations of well-known types or works of art, and the absence of Gaulish subjects is remarkable. They include representations of gods and heroes, warriors and gladiators, hunters

as a jewel-like decoration of small pieces made in a very sandy paste, or actually carved from stone, and the Assyrians, on a bolder scale, in their glazed and coloured brickwork. Though the Egyptian and Syrian empires were overthrown, the peoples of these countries remained; and, as we are now aware, carried on their traditional craft, though in a less splendid way. There is abundant evidence that pottery was made in the Egypt of Roman times and later with rich turquoise blue and yellow glazes, though the potters had learned to produce this glaze on a material containing more clay and less sand than that used in earlier days. We know also that they had learned that the addition of lead oxide to a glaze enabled such glaze to be applied on vessels formed from clay which was sufficiently plastic to be shaped on the wheel. This knowledge was not confined to Egypt, but appears to have been spread over Syria and parts of Asia Minor; and throughout the Byzantine empire many forms of pottery were made which were clearly the starting-points of much of the fine pottery produced in Europe in later times. We find, for instance, side by side, a manufacture of bowls, dishes and vases of very simple shape, yet made of two distinct materials: (1) a whitish sandy body, on which turquoise, blue, green or even white glaze, consisting mainly of silicates of soda and lime, was used either without ornament or with simple painted patterns in black or cobalt blue under the glaze; (2) similar vessels made of a lightish red clay, also rather sandy and porous, coated with a white slip (pipeclay or impure kaolin) covered with a yellowish lead glaze. These vessels were decorated in a variety of ways: (1) Graffiti; patterns cut or scratched through the coating of white slip while it was still soft, down to the red ground, so that when the vessel was glazed it displayed a pattern in dark upon a light ground. (2) Yellow and red ochre and copper scales were rudely “dabbed” over the white slip surface, so that when the vessel was glazed it presented a marbled or mottled appearance with touches of red, yellow, brown or green, on a yellowish-white ground. (See the section on Egyptian pottery above.) (3) Oxides of copper or iron were added to the lead glaze, and the resulting green or yellow glazes were applied to plain vases or to vessels decorated with moulded reliefs. In all these methods we see the continuation of old tradition in simpler forms, and we shall also see that these, in their turn, became the starting-point of much of the medieval pottery of Europe, particularly of Italy and the other southern countries.

In the same way, a little farther east, the Persians of Sassanian times seem to have preserved some of the traditions of the potters of Assyria, just as they inherited their skill; and the Assyrian device of raising strong brown outlines round a design to control the flow of coloured glazes, which is exemplified in the Frieze of Archers in the Louvre, was carried on by them, for it appears unchanged in the tiles of the Mosque of Mahomed I. built at Brusa in the 13th century. The intercourse between the Persian and Byzantine empires at this time must have led to a general diffusion of technical knowledge among the pottery centres of the various countries round the eastern end of the Mediterranean, and our knowledge is too fragmentary to furnish sufficient data for any definite placing of the progress made. Our information is mainly derived from the examination of the Mamluke mounds at Fostat, or Old Cairo, in Egypt, by Dr Fouquet, and by eager inquirers like Henry Wallis. Fostat was built in A.D. 640 by Amr and destroyed in the 12th century; partially rebuilt, it was given over to pilage in 1252 by a Mamuleke sultan, and all that remains is the Old Cairo of to-day, the rest of the site being covered with accumulated rubbish heaps. In the same way Rhagae or Rai, one of the ancient capitals of Persia, the site of which lies a few miles east of Teheran, was destroyed about 1220 by Jenghiz Khan. Like Fostat it was partially rebuilt, but was destroyed again in the following century, so that its existence practically ceased in the 14th century. Rhagae was once an important centre of the ceramic industry, but this was transferred to the neighbouring town of Veramin, in the 13th century. Excavations have also been made on the site of Rakka, near Aleppo, in Syria, and from all these sources, and a few others...
minor importance, much interesting light has been thrown on the development of the potter’s art in these countries during the period between the 4th and 12th centuries. Yet, until systematic excavations have been made in Persia, Anatolia, Syria and the Delta, on the same scale as those which have proved so valuable in Greece, Crete, Cyprus and the valley of the Nile, we cannot hope to possess sound chronological data of the developments of the arts in these countries. Meantime the exact share which should be allotted to each district for its discoveries will remain ground of contention for scholars of conflicting schools, though there can be little doubt that Egypt and the southern part of Syria played a more important part than has generally been supposed in the development of the potter’s art at this period.

**Persian Pottery.**—The most important pottery of the nearer East, whether considered on its own merits or from the influence it has exercised on the pottery of later times, is that so highly valued by collectors under the distinctive name of Persian; though much that passes under that name may not have been made in Persia. From the 10th to the 16th centuries the craftsmen of Persia were perfect masters of decorative design and colour; and, as potters, they possessed a sense of the forms proper to clay, such as none of the great races of antiquity ever exhibited. The shapes of Greek pottery speak more strongly of metal than clay, but the best Persian work exhibits a feeling for the material that has rarely been equaled. The shapes are not only true clay-shapes but they are designed so as best to exhibit the qualities of the glaze and colour with which they were to be decorated. Certainly from the 11th to the 16th centuries the pottery of the Persians must rank among the greatest achievements of the potter’s art. The ware is shaped from various mixtures such as we have already spoken of—but whether its body was a mixture of white clay with a large proportion of sand, or some inferior clay that burnt to a yellowish or red tint, and was surfaced with a fine white coating of siliceous slip, or with a mixture of soda-glass, clay and oxide of tin, which made it whiter still—the one aim was to produce a white pottery. On this white ground—with a coarsish absorbent surface—beautiful patterns, in conventional floral or animal forms, were deftly painted in cobalt-blues, manganese-purples, copper-greens and turquoise, with mixtures for intermediate tints; while a strong brownish-black outline colour was compounded by mixing the oxides of iron and manganese, to be turned into a fine, still black by the addition of a trace of cobalt and later of oxide of chromium. Over this freely painted colour, often used in broad flat masses, a singularly limpid alkaline glaze, generally of considerable thickness, was fired until it just fused; and the resultant effect is of the most rich and brilliant colour relieved on a ground of slightly toned white. Judging from fragments which have been found at Rai, and which can scarcely therefore be later than the 13th century, we find the characteristic Persian style of ornament already developed; dumpy little figures kneeling, standing or riding on grass between cypress trees, or animals and birds similarly disposed, with conventional borders and bands of Cufic inscriptions. Another well-known type of pattern consists of highly conventionalized floral ornament which often runs to a beautiful tracery of “arabesque” lines. The drawing is generally finely outlined with brown or black (a survival of the ancient Assyrian practice), and in the earliest pieces the flat washes of colour are laid in only in cobalt-blue, turquoise or green from copper, and shades of purple and brown from manganese. From the 16th century onwards Chineae influence is strongly felt both in the designs and in the colour schemes, particularly in the wares painted with patterns in blue only (fig. 50), which sometimes carry the imitation of Chinese blue; so far as bear forged Chinese marks. Finally, Shah Abbas I. (1587–1620) is said to have brought a number of Chinese artificers, among them many potters, to Isphahan, and we find that Chinese porcelain was largely painted at KIng-té-Chén, with blue decorations in the Persian taste, so that we cannot be surprised at the growth of a hybrid Perso-Chinese style of decoration. From this period, however, Persian pottery deteriorated both in its technical and artistic aspects. Crudely moulded figures in fairly high relief, coloured with an opaque yellow and green as well as with transparent blue and turquoise, began to make their appearance, especially on the famous Persian tiles; and in the 18th century the brown and black outlines of the drawing (a most valuable decorative resource) vanish, and we get brighter and more glittering, yet poorer colours, including a rose-red enamel fired over the glaze, evidently imitated from the Chinese famille-rose porcelains of the 18th century.

The finest work appears to have been produced from the 11th to the 14th centuries; yet so imperfect is our knowledge of what is truly Persian, Syrian or Egyptian, that we are forced to accept many conventional names that have perhaps little but custom to recommend them. There is, for instance, an important class of pottery known, until recently, only from a few remarkably handsome vases, and once called “Siculo-Arab” because these few examples had been mostly found in Sicily. This ware is characterized by its fine quality and its distinctive ornament—leaf-shaped panels with arabesques; interlacing patterns; striped and dotted bands; friezes of animals or birds amidst flowers and foliage, inscriptions, &c.; all strongly and firmly drawn in black or brown outlines and washed in with a very pure cobalt-blue or with turquoise. In spite of the resemblance of these pieces to the oldest Persian wares, we know that bowls, dishes, vases and spoilt pieces of the same kind have been dug up on the site of Rakka near Aleppo; similar ware has been found at Fostat, together with evidences of local manufacture, and occasional pieces have been brought from Persia; so that probably this distinguished ware was made at Rakka in Syria between the 9th and the 11th centuries, and was afterwards made by Syrian potters both in Persia and Egypt.

**Other Persian Wares.**—We have already spoken of the prevalent use of coloured glazes in all the countries of the nearer East—from Egypt to Persia—from remote times, either as the sole colour decoration or in conjunction with modelled or painted ornament. The fragments from Rai and Fostat include rich turquoise glazes (derived from the ancient Egyptian), deep and light-green glazes containing lead and copper, imitations of ancient Chinese céladon-green, a brownish-purple glaze, a coffee-brown glaze and a deep cobalt-blue glaze. All these may be:

![Persian Plate painted in blues only. (Victoria and Albert Museum.)](image)

1 A peculiarity of the Persian and allied blue glazes, of many shades, is that they appear to have been produced not by dissolving the colouring matter in the glaze, but by coating the white ground of the ware with a thin wash of some cobaltiferous substance—probably an earth containing varying proportions of cobalt, manganese and iron—and then melting a thick alkaline glaze over it.
found either on plain vases, or on vessels with modelled ornament; or covering delicate floral or arabesque patterns painted in white slip or incised in the paste. Sometimes, even at this early period, there are traces of applied gold-leaf, but not fired, to the glaze.

At a very early period, too, we find those beautiful bowls, dishes and vases decorated with geometrical or arabesque patterns in a singularly still underglaze black, and covered with the blue turquoise or green copper glazes. This characteristic and beautiful ware is common to Persia, Syria and Egypt in Saracen times, and it was soon prized in Europe, as is shown by the famous fragment found by the late Mr. Drury Fortnum built into the outer walls of S. Cecilia in Pisa, where it was apparently placed in the 11th century.

At a later date a shining black glaze made its appearance, and in the 13th century pale and lapis-lazuli blues, while there is a comparatively modern sage-green glaze found only on pieces bearing patterns modelled in low relief.

**Persian Porcelain.**—This beautiful and somewhat mysterious ware—often called "Gomroon"—apparently made its appearance in the 13th century, though the bulk of the known examples is not earlier than the 17th or 18th century. The ware is quite translucent and is of soft and delicate texture. Unlike Chinese porcelain, it was made from a mixture of pipe-clay and glass, and was glazed with a soft lead glaze; so that a fragment of it would melt to an opaque glass in an ordinary porcelain oven. It is principally met with in the form of dishes, bowls (often mounted on feet) and saucers. The pieces are generally very thin and are either perfectly plain or bear fluting or simple wavy patterns incised in the paste. Most characteristic and beautiful is the decoration by means of delicate perforations either straight or lozenge-shaped. In the finest pieces the perforations are filled with glaze, and then they form a decoration analogous to the well-known "rice-grain" decoration of the Chinese. Occasional pieces are found decorated with colour, either a delicate green, producing an effect like pale bright celadon, or the well-known Persian blue ground; and this is sometimes decorated with lustre patterns. Nowhere can this rare and delicately beautiful ware be so well studied as in the Victoria and Albert Museum.

**Lustred Ware.**—The decoration of pottery with iridescent metallic films is one of the most astonishing and beautiful inventions ever made by the potter. Hitherto we have seen only coloured clays, coloured glazes, or colours fired under the glaze, but we are now brought face to face with a colour effect produced by refiring the finished glazed pieces, at a lower temperature, with pigments painted upon the glaze (fig. 40; see also Plate V. 13th-century Persian lustre). How such a practice originated is probably an idle speculation, but it may have come through repeated attempts to decorate pottery with gold. If gold was painted under the glazes of these ancient vases, it would probably vanish and leave no trace; but gold, alloyed with much silver, applied over the finished glaze and refired, in the attempt to make it adhere, may have given the first films of iridescent colour.

We know certainly that before the 13th century the elements of the process had been mastered, and that the potters of the nearer East had learnt that by mixing some compound of silver (doubtless the sulphide) with clay and applying the mixture on the finished vase, which was refired in such a way that the pieces were only raised to a dull red heat and were then exposed to the vapours of the wood-fuel, glowing lustrous patterns were left on the ware that looked like metal—but metal shot over with all the hues of the rainbow, golden, rosy, purple and green. Numerous fragments of this lustred pottery had been disinterred from the site at Rhagae, and it was therefore assumed that the beautiful process was of Persian origin, particularly as most of the examples then known bore designs of distinctly Persian style.

We are now inclined to think that the process really arose in Egypt or in Syria, and was carried eastward to Persia, just as it was afterwards carried westward to Spain. In support of this view there is the written record of the Persian traveller Nasiri Khusrau, who visited Old Cairo in the 11th century (1055-1042).

He was apparently familiar with the pottery of his own country, and notes all the novel forms that he found in the bazars of Old Cairo, which was both a great trading emporium for the traffic of East and West, and a pottery centre of note. He mentions, specially, certain translucent bowls of earthenware decorated with colours resembling a stuff called "bogulemoun," "the tints changing according to the position which one gives to the vase." Such a description could only apply to "lusted" pottery, and it would seem as if this process must have been known in Egypt or Syria before it was practised in Persia (see Plate V., 13th-century Syro-Persian). In any case the secret was soon carried to Persia, for we have ample evidence that it was practised at Rhagae in the next century.

The earliest dated example of Persian lustred ware is a star-shaped tile of the year A.D. 1217 (A.H. 614), decorated with spotted hares, heraldically confronted, in a ground of lustre relieved by dots and curls, and surrounded by an inscribed border. A vase in the Godman collection bears the date A.D. 1231 (A.H. 629), and some of the well-known "star and cross" tiles from Veramin belong to the year A.D. 1262. The early Persian

---

1 See Drury Fortnum, Archaeologia, vol. xlii.
with designs in low relief, picked out with scrolls and arabesques in white enamel or bold floral sprays in leaf-gold. Lustre is frequently found applied to the rich cobalt-blue ground, and there are still existing a few magnificent vases which show the artistic possibilities of this scheme of decoration. It should be noted that when the pieces are in the round, the pattern is usually painted in lustre and not reserved in a lustre ground as on the flat tiles. In the later examples the tin-enamel was replaced entirely by white slip, and the lustre decoration continued in use until the end of the reign of Shah Abbas I. (1587-1629). To the last period belong many charming bowls, narghils, cups and dishes in a brown lustre, with ruby reflets, on a white or a deep blue ground; this ware is pure white in substance and generally translucent, and the pieces are occasionally signed (see Persian porcelain above).

_Damascus Ware._—This time-honoured name (for “Damascus Ware” was often mentioned in medieval inventories, and appears to have included many varieties of oriental pottery which were highly prized in Italy, France and England in the middle ages) forms rather a puzzle nowadays for the archaeologist, for many diverse wares have

![Fig. 41.-Lamp from the Mosque of Omar.](image)

The painter is the poor and humble Mustafa.” This is reckoned as June A.D. 1549. It may be remarked that our difficulties of identification are increased by the fact that, under Arab rule, Syrian and Persian potters were at work in Damascus, in Old Cairo and elsewhere. Among the Fostat fragments classified by Dr Fouquet are many bearing the signatures of Syrian workmen. In the 15th and 16th centuries, too, imitations of Chinese blue-and-white porcelain became common throughout the nearer East, and quantities of fragments have been found at Fostat, Ephesus and elsewhere.

_Turkish Pottery._—This beautiful and striking ware, formerly called Persian, and till lately Rhodian because Rhodes was a known centre of manufacture, seems to have been fabricated in all the countries overrun by the Ottoman Turks in the 16th century, so that the name “Turkish,” in spite of some opposition, is now generally applied to it. (See fig. 42; and the 16th-century Rhodian or Turkish pieces, Plate V.) It has a fine white body of the usual sandy texture, covered, as a rule, with a wash of pure white slip; it is painted in strong brilliant colours, chiefly blue, turquoise, green, and a peculiar red pigment which is heaped up in palpable relief—the whole of the ornament being outlined with black or dark green.

The ware was glazed with an alkaline glaze of great depth, so that the colours soften and sometimes run, producing one of the most brilliant and attractive of all the oriental wares. In certain districts the white ground was not used, but over it a slip of the red colour (Armenian bole), varying in strength from bright red to pale salmon, was laid over the piece, reserving the pattern only in the white slip, which consequently lies lower than the red ground. Other examples are known where the ground has been covered with lavender, blue, sage, apple and turquoise greens, chocolate or coffee-brown, and the sumptuous effect of the whole was often increased by the application of gold-leaf over the fired glaze. The decorative motives are distinguished from those of the Persian wares by a breadth and boldness which are in keeping with the brilliant, and not always harmonious, colouring. They include, it is true, the Persian arabesque, the floral scroll with feathery leaf, the thistle-bloom and the cypress tree, but the naturalistic treatment which permits immediate recognition of the favourite Turkish flowers such as the tulip, hyacinth, carnation, fritillary, cornflower and lily (some of which were imported into Europe by the Turks), is as original and distinctive as the arrangement of the different elements of the design is artistic and charming.

Other styles of design include formal patterns and diapers, rarely human and animal figures, and occasionally armorial devices and ships. Tiles of this ware were extensively used for lining the walls of public buildings, replacing the carpets and textile hangings which their designs so freely imitated. Of domestic articles, dishes are the most numerous, though vases, ewers, sprinklers, jugs, tankard-shaped flower-holders, covered bowls and mosque lamps are also plentiful. The tiles are found in all parts of the Turkish empire, though they were probably made at certain centres, such as Nicaea (which gave its name to the ware in the 16th century and no doubt supplied many of the mosques in Constantinople), Kutaia, Demitoka, Lindus and other centres in Rhodes and Damascus. Individual wares cannot be
distinguished, except in some measure those of Damascus and Kütai. A small jug in the Godman Collection has an Armenian inscription stating that it was made by “Abraham of Kütai” in the 16th century. A few fine bowls and vases, painted in a beautiful blue with Persian arabesques and rosette scrolls, recalling Chinese porcelains of the Ming dynasty, but of very characteristic appearance, are also attributed to this place; and later, in the 18th and up to the end of the 19th century, an inferior ware was largely manufactured here. This late ware usually takes the form of small objects—plates, cups, jugs, egg-shaped ornaments, &c.—with a thin, well-potted, white body and slight patterns of radiating leaves, scale diapers, &c., in blue, black and yellow. Turkish pottery was at its best in the 16th and the early part of the 17th century, and though good tile work of later date exists, the general pottery deteriorated before the 18th century. An inferior ware of poor colour is still produced in Turkey, Persia and Syria, and some attempt has been made of late to revive the old lustre decoration, but the results are not likely to be mistaken for those of old times.

Collections.—The Victoria and Albert Museum contains the finest collection of the medieval pottery of the Near East—the British Museum collection, though much smaller, has some magnificent examples. The Cluny Museum in Paris has a never-to-be-forgotten collection of Turkish pottery, especially plates and dishes. The museums of the Louvre and of Sévres have also many beautiful examples. Berlin, Frankfort and other German towns have collections, but much smaller in extent. Private collectors in England and France own many fine specimens, and mention may be made particularly of those owned by Mr. Dugan Godman and Mr. George Salting.

Hispano-Moresque Pottery

With the doings of the Moslem potters of the countries round the eastern Mediterranean fresh in our minds, it is interesting to follow the westward trend of the Moslem conquests, and see how in their wake there also sprang up in Spain a ware of high distinction and beauty. The Iberian peninsula had been the scene of pottery-making from prehistoric times—a red unglazed ware was made before the dawn of civilization as finely finished as that found in the Nile valley by Flinders Petrie (see Egypt: Art and Archaeology), and the Romans had one of their great provincial pottery centres at Saguntum; but it was only when a great part of Spain lay under Mussulman rule that artistic and distinctive pottery was produced. What is by no means clear is how it came to pass that when the traditional methods learned by the Arabs in Egypt and Syria, were carried westward they should have undergone such a radical change. Oxide of tin, the opacifying and whitening material in glazes par excellence, was certainly known and used in the East from at least the 6th century B.C.; the ancient wares are coated with a covering of white tin-enamel to hide the buff or reddish-coloured clay, and it was similarly used elsewhere; but its use was sporadic and not general in those countries, where we find instead a consistent development of the pottery made with a white slip-coating and a clear alkaline glaze. Perhaps it was that at this period tin was almost as costly as gold, and it was only when potters with an oriental training brought their skill to Spain, where tin abounded, that the relative cheapness of the material led them to employ it, so far as is known, exclusively. (There is a wide distinction between the tin-enamelled and the slip-faced wares, glazed with an alkaline glaze. In the latter, the more oriental type, the slip-coating is of fine white clay and sand, and this is finished with a transparent alkaline glaze containing little or no lead; in the former there is no need of a coating of slip, for

the addition of oxide of tin to a glaze rich in lead gives a dense coating of white enamel, opaque enough to disguise the color of the clay beneath.) Such colours as were used for painted patterns were painted over this enamel coating before it was fired, so that they became perfectly incorporated with it, and then this ground furnished a splendid medium for the development of those thin iridescent metallic films that we call “lustres.” The knowledge of this lustre process had been brought from the East also, where it was used on another ground, and with the growing use of lustre pigments containing copper as well as silver—until the red, strongly metallic copper lustre almost ousted the quieter silver lustres—we get the simple technique of one of the most distinctive kinds of pottery known.

Briefly, the wares were “thrown” upon the wheel or “pressed” on modelled forms—handles, ribs and dots of clay, or strongly incised patterns were often added by hand—and they were then fired a first time. A coating of the tin-enamel (rich in lead as well as tin) was applied, and on this coating designs were painted in cobalt and manganese; sometimes these colours were only used as masses to break up the background. Then the second firing took place and the piece came from the firing all shining and white, except where the blue or brownish purple

HISPANO-MORESQUE

FIG. 43.—Hispano-Moorish Plate, painted in blue and copper lustre, had been painted (see fig. 43). The lustre pigments, a mixture of sulphide of copper or sulphide of silver, or both with red ochre or other earth, was then painted over the glazed surface with vinegar as a medium. The repainted piece was fired a third time to a dull red heat, and smoked with smoke from the wood used in firing, and when cold the loosely adherent ochre and metallic ash left were washed off, leaving the iridescent films in all their beauty.

The technical practices of the Spanish potters and the composition of the lustre pigments are given in Cock's account of the processes followed at Muel (Aragon) in 1585. The Manises receipt of 1785 gives:—copper 3 oz., red ochre 12 oz., silver 1 peseta piece, sulphur 3 oz., vinegar 1 qt. and the ashes scraped off the pots after lighting 30 oz.1 Interesting documents have recently been published concerning the works executed by the “Saracen,” John of Valencia, at Poitiers in 1384, and it is certain, from the list of materials supplied to him, that he made there tiles that were enamelled and lustred.

The earliest record of lustred pottery in Spain is the geographical Edrisi's mention of the manufacture of "golden ware" then carried on at Calatayud in Aragon in 1154. Ibn Sa'id (1214-1280)

1 See Rioho, Spanish Arts, Victoria and Albert Museum Handbook, pp. 199-151; and Sobre la manera de fabricar la antigua lona dorada de Manises (1878).
CERAMICS

ITALIAN

speaks of the glass and the golden pottery made at Murcia (city), Almeria and Malaga. From the 14th century the notices which have come down to us divide themselves into two main groups relating to the industry (a) at Malaga; (b) at various localities, but especially Manises in Valencia.

Malaga.—Malaga was situated within the Moorish kingdom of Granada, which formed, from 1235 until the late 15th century, the last remnant of Moorish dominion in Spain. Here under the art-loving Nasride dynasty, Mussulman arts and learning flourished to an unprecedented degree. In 1337 Ahmed ben-Yahya al-Omari enumerates, among the craft productions of Malaga, its golden pottery, the like of which he declares is not to be met with elsewhere. The Moorish traveller Ibn Batuta mentions (1350) the Malagan golden pottery, as does Ibn al-Hatib (1375-1374) of Granada, in his description of Malaga. The principal monument of the period is the royal palace of Granada, begun in 1273, and finished during the 14th century, from which period most of its ornamentation dates. Two vases were discovered there, one of which the existing one, known as the "Alhambra vase," is admittedly the most imposing product of Hispanic-Moresque ceramic art extant. Its amphora-shaped body (4 ft. 5 in. high) is encircled by a band of Arabic inscription, above which are depicted gazelles reserved in cream and golden lustre upon a blue field; the rest of the body and the prominent handles are covered with compartments of arabesques and inscriptions in the same colours; and panels on the neck, divided by mouldings and decorated with strap-work and arabesques. Vases similar in shape and technique, with ornament of Cuic characters and arabesques in horizontal rows, are to be found in the museums at St. Petersburg, Palermo and Stockholm. As to the exact date of these, experts are not agreed. Though presenting all the characteristics of the 14th-century Hispanic-Moresque ornament, it seems probable that they were produced at the same period as the large lustred wall-tile formerly in the Fortuny (now in the Osma) collection, an inscription upon which is by some held to refer to Yusuf III. of Granada (1409-1418), not to Yusaf I. (1335-1354). Another remarkable example is a dish (Saar collection, Berlin), which, it is claimed, bears upon its base the name of the Arabic, the word Malaga; it is ornamented with eight segmental compartments filled alternately with strap-work designs and arabesques in lustre. Malaga was reconquered by Ferdinand and Isabella in 1487, and after this its industry probably decayed, as it is not mentioned by Lucio Marino in 1539 among the localities where ceramics then flourished.

Valencia.—The emirate of Valencia was reconquered by Aragon in 1238. The history of its lustred ware is known from 1383, when Eximenes (whose evidence has been erroneously held to date from 1499) mentions the golden ware (Obra dorada) of Manises. Valencia potteries of this kind was an offshoot of the Malagan industry, as in documents lately published (ranging from 1405 to 1517) it is repeatedly designated Malaga ware (Obra de Malaga). Its decorative qualities became famous throughout the whole of Europe and North Africa. The ware was chiefly manufactured at Manises by the Moorish retainers of the Buyl or Boil family, lords of Manises, who levied dues upon the output of the kilns, and occasionally arranged for its sale. It is distinguished as regards its ornamentation from the pottery of Malaga by the adoption of a more natural rendering of plant form motives and by the use of armory. The ware consists of drug pots, deep dishes, large and small plates, aquamaniles, vases, &c. Some dozen varieties of ornament were employed during the 15th and early 16th centuries, including mock arabic inscriptions, various flower or foliage patterns taken from the vine, bryony, &c., and gaddros. The centres of dishes frequently bear the arms of a king or queen of Aragon, of the Buyls of Manises, or other Valencian or Italian families for whom they were made. Great dexterity is shown in the execution of minute and complicated schemes of ornament and in the richness of the colour schemes; golden lustre of various hues, with blue and manganese, form the simple combinations, but the ruby, violet or opalescent lustre combine to produce with the colours a wonderful decorative effect. From 1500 the use of blue and manganese was gradually discontinued and the ornament quickly became nondescript, but the brilliance of the lustre pigment nevertheless obtained a wide popularity for the ware, as is attested by Marino (1539), Viciana (1564), and Escalonato (1610). After the expulsion of the Moriscoes (1609) the industry was carried on by those who had escaped deportation or by Spaniards who had learnt the craft; generally speaking their productions can be summed up in the word "decadence." In the course of the 15th century the manufacture of lustred pottery was carried on at various other small towns near Valencia; in 1484 it was produced at Mislata, Patera and Gesarte. It is known to have flourished at Calatayud in 1507, and at Muel, also in Aragon, in 1589. In the Valencia district much pottery for ordinary use, ornamented with blue on white, was also produced.

Majorca.—Sculler, in 1557, states that Chinese porcelain was imitated in the Balearic Islands, and that the Italians called these imitations "majolica," changing the letter in the name of the islands (then called Majorica) where they originated. The truth would appear to be that Valencian wares, being exported in Balearic vessels that called at Majorca on their voyage to Italy, acquired a reputed Mallorcan origin. There are several letters of a majolica maker's petition praying for permission to establish himself in Majorca (1560), in which he states that "Manises ware," &c., had to be imported, as it was not made there.

Collections.—In England, the Victoria and Albert and the British Museums have fine collections of this ware. At Paris the Cluny Museum collection, and the Louvre; the museum at Sèvres contains typical pieces, and a good collection is that of the archaeological museum at Madrid. The Bibliothèque Nationale and the British Museum contain important collections from the Moorish emirate and the Nasride period. The Metropolitan Art Museum at New York and the Boston Museum of Fine Arts also contain good specimens. The private collections of England, France and Italy are rich in these wares, among the finest being those of Mr F. D. Godman (Horsham), and of Don G. J. de Osma (Madrid).

MEDIEVAL AND LATER ITALIAN POTTERY

Little is known of the potter's art in Italy after the fall of the Roman empire till the 13th century. The traditions of the Roman potters appear to have been gradually lost, leaving behind only sufficient skill to make rude crocks for domestic use and to coat them, if required, with a crude yellowish lead glaze sometimes stained to a vivid green with copper oxide. Applied ornament of roughly modelled clay and scratched designs were the chief embellishments of such wares, which were of the same class as the medieval pottery of Great Britain and the north of Europe. In the 14th and 15th centuries, however, contact with Asia Minor, Syria, Egypt and Spain, where ceramic art had been highly developed in fresh directions, as we have seen introduced into Italy as well as the rest of Europe those superior wares characterized by a white surface decorated with bright colours under a brilliant transparent glaze, and glorified by metallic lustres. The Italian potters did not long remain unaffected by these influences, but though Persian, Syrian and Egyptian pottery must have been fairly plentiful in the households of the wealthy, it was the distinctively Hispano-Moresque wares from which the potters of Italy drew the inspiration for a new ware of their own. The technique of a siliceous slip-coating with colour painted on that and covered with a transparent alkaline glaze, was only sparingly used, and then not very successfully; it is only the introduction of the tin-enamel that was turned to fruitful account and led to the production of the magnificent Italian majolica of the 15th and 16th centuries.

1 See examples in colour, Plate VI.
In the same way the practice of lustre decoration might have been
learned from the Orient, but its late appearance on Italian wares
(16th century) and its evident relationship to the lustres of Spain,
rather than to the earlier lustres of Egypt, Syria and Persia, are
further evidence that though oriental decorative motives gave
the Italians certain early types of design, it is the Hispano-
Moresque potters from whom the Italians learnt the art they were
afterwards to develop so splendidly in a new direction.¹
All the Italian pottery above the level of common crocks may
be conveniently grouped into four classes.

1. The native wares, made of coarse and often dark-red clay,
coated with a white clay slip (a kind of pipe-clay) and covered
with a crude lead glaze, either yellow or green. The idea of
rendering this ware ornamental, and fitting it for more than
vulgar use, led to a great development of the graffiato process;
where, while the vessel, with its white clay coating was yet
soft enough, patterns were scratched or engraved through the
white slip to the red body beneath. This decorative method
has been already mentioned several times, for it was practised
during the early middle ages in all the countries from India to
Italy, and the Byzantine potters were adepts in its use. Nor
has its practice ever ceased in Italy, for through all the times
simple means. As fine examples of this kind we may mention the
dish with the mandoline players, and one with cups and spoons
in a tree, in the Victoria and Albert Museum; the tazza, supported by three modelled lions, in the Louvre; and
the dish, with figures of the Virgin and two saints, in the museum
at Padua. The ware has often been called, quite erroneously,
mezza-majolica. It had nothing to do with majolica, being
the natural development of a much older process; and its manu-
facture was carried on all through the period of majolica manu-
facture and has never ceased.

2. Mezza-Majolica.—This name is accurately applied to certain
Italian wares that made their appearance in the 12th century
or even earlier, when rude patterns—a clumsy star, a rude
crossing of strokes or some equally elementary work—are found
painted on a thin white ground covering a drab body. The pieces,
generally pitchers of ungainly forms, are uncouth in the extreme; the body has been shaped in local clay and then thinly
covered by dipping it into a white slip, which seems at first
to have been of white clay only, though oxide of tin and lead were
added to it even in the 12th century. The colours used for the
rude painting were oxide of copper and oxide of manganese,
and the final glaze, which is generally thin and often imperfectly
fused, seems to have been based on the alkaline glazes of the
nearer East. The specimens so assiduously recovered by
Professor Araganni, some of which, or similar wares, are to be
found in the Louvre, the British and the Victoria and Albert
museums, are typical of the rude work out of which, by a fuller
knowledge of Spanish methods, the painted majolica grew.

3. Majolica.—For the last three centuries the word majolica
has been used to signify an Italian ware with a fine but com-
paratively soft buff body, coated with an opaque tin-enamel
of varying degrees of whiteness and purity, on which a painted
decoration was laid and fired. In the later pictorial wares, a fine
coating of transparent alkaline glaze was fired over the painting
to soften the colours—really to varnish them. The work itself
appears to have been derived from the name of the island
Majorca, and was originally applied by the Italians to the lustred
wares of Spain which were largely imported into Italy, probably
arriving in ships that called at or hailed from Majorca, as we do
not believe that the ware was actually made in that island.
That the secret of the tin-glaze, which is the essential feature of Italian
majolica, was known in Italy in the 13th century is practically
proved; and there is both literary and archaeological proof of its
use there in the 14th century. Mention of it is made in the
Manfredi palace at Faenza, must have been made shortly
after 1393. Its development marched side by side with that of
the mezza-majolica, until it practically superseded the latter for
painted wares in the 15th century; but the earliest examples
have little more than an archaeological interest, and it was only
after the last decade of the quattrocento or the first of the
cinquecento that it blossomed into an artistic creation. In its
prime the production of majolica was confined to a very small
part of Italy. Bologna on the north, Perugia to the south, Siena
on the west, and the Adriatic to the east, roughly enclose the
district in which Fezana, Faenza, Prato, Majolica, Faenza,
Durango, Gubbio, Perugia and Siena. Towards the middle of the 16th century Venice on the one hand, and
in the 17th and 18th centuries the Ligurian factories at Genoa,
Albissola and Savona, made majolica of the later decadent
styles, while, at the end of the 17th and in the early part of the
18th centuries, the southern town of Castelli, near Naples,
produced a ware which closes the period of artistic majolica.

4. Lustred Majolica.—This brilliant species of Italian pottery
(to which alone Piccolpasso applied the name majolica) seems
to have been mainly produced at Deruta and Gubbio, though
experiments were made at Caffaggio and probably at Faenza
and Siena. Considering how much the Italian majolists owed
to the Spanish-Moorish potter, it is remarkable that this beautiful
method of decoration should have made so tardy an appearance,
for the earliest specimens do not appear to be much earlier than

⁰There is ample documentary evidence to prove how largely the
lustred pottery of Spain was imported into Italy from the 12th
century onwards; and it is important to note in this connection that
almost all the fine examples of Hispano-Moresque in our modern
collections have been obtained from the palaces of ancient Italian
families.

the end of the 15th century, and the process was apparently abandoned by the middle of the 16th. The lustre wares of Deruta, probably the earliest made in Italy, have strongly marked affinities with their Spanish prototypes; the earlier examples are hardly to be distinguished from Spanish wares, and to the last the ware remained technically like the earlier ware, though with perfectly Italian decorative treatment. Yet the best examples of Deruta silver lustre have a quality of tone that has never been surpassed; a colour resembling a wash of very transparent umber bearing a delicate nacreous film of the most tender iridescence. The Gubbio lustre is best known to us through the works of Maestro Giorgio, whose distinctive lustre is a magnificent ruby-red unlike any other. In all probability the lustre process was so quickly abandoned on the fine painted majolica, because the increasing efforts to make a "picture" were discounted by so uncertain a process. When one of the later majolica painters had spent weeks on the decoration of some vase or dish, with an elaborate composition of carefully drawn figures, it was not likely that he would care to expend it to any risks that could be avoided. The risks of the lustre process were inordinately great—Piccolpasso says, "Frequently only six pieces were good out of a hundred"—so that its use was relegated only to inferior wares, and then the process was relinquished and forgotten until its rediscovery in the second half of the 19th century.

The history of the development of these noble wares is by no means clear, nor is it always certain what part was played by each town in the successive inventions of technical methods, decoration and colouring, so that it is better, in such a general sketch as this, to treat the subject in its broadest features only. In the earlier painted wares the only colours used were manganese-purple and a transparent copper-green as on the mezza-majolicà, but early in the 15th century cobalt-blue was added to the palette, and, later on, the strong yellow antimoniate of lead, mixed with iron. The decorations at this period were largely influenced by the wares imported from Persia, Syria, Egypt and Spain, specimens of which were so prized as to be used for the decoration of church fronts and the façades of public buildings. The lustre of the Saracenic wares was not yet understood, but its place was taken first by manganese and afterwards by yellow. The designs were chiefly conventional flower-patterns in the Persian or Moorish style, arabesques, and floral scrolls, the ground being filled at times with those tiny spirals, scrolls and dots to which the Eastern potters were so partial. Figures, human and animal, were introduced either among the formal ornament or only surmounted from it by panels, of which the outlines often followed the contours of the central design (see the early 15th-century Faenza piece, Plate VI). The figures were, in fact, drawn to conform to the outline of the vessel, and not the vessel made to display the subject as in the majolica of the succeeding century. The earliest dated example of this period is the pavement laid down in the Caracciolo chapel in the church of San Giovanni in Minore, in Naples, about 1450. Specimens of these tiles may be seen in the British Museum, and from their style it has been suggested that they were made by some Spanish potters brought over to Naples by Queen Joanna, who was of the royal house of Aragon. To this period also have been referred the large ovoid jars made to contain drugs or confectons, and decorated with bold scrolls of formal oak leaves enclosing spirited figures of men or animals, or heraldic devices. These are characterized by a rich blue colour generally piled up in palpable relief and sometimes verging on black; the outlines are usually in manganese, and transparent green is used for details and occasionally even as a ground colour. This ware has been definitely assigned to Florence on what seem very inadequate grounds, and it is better to speak of it simply as Tuscan. Then, essentially Italian ornament began to assert itself, and it redounds to the credit of the Italian majolists that he soon freed himself from repeating the styles of the wares from which he obtained his methods, and produced a distinctive type of ornament of his own. He revelled in patterns with bold floral scrolls, or those based on peacocks' feathers (see fig. 45), and

![Fig. 45—Early Faenza plate, with peacock-feather design, in blues, yellow and orange-red. (Victoria and Albert Museum)](http://www.example.com)

then be advanced to concentric bands of painted ornament, borrowed from classic art yet breathing the true spirit of the Renaissance; while cable borders, chequer and scale patterns, bands of stiff radiating leaves, festoons of fruit and flowers, zigzags and pyramidal scrolls occupied nearly the whole surface or framed an armorial or emblematic central subject. Figure-subjects occur with increasing frequency as the century advanced; Madonnas and other sacred subjects, portraits, and, occasionally, groups of figures after the early Italian masters, or scenes borrowed from the first illustrated editions of the classics, gradually encroach on the conventional borders and occupy more and more of the surface of the piece. The provenance of these 15th-century pieces still remains uncertain—Faenza, Forli, Florence, Siena and other places offering rival claims,—but there is no doubt that from the earliest times Faenza was the most fertile centre of their manufacture, and almost all the motives of the quadruccio wares are found on fragments discovered there or on examples that can be traced to Faentinese factories.

It is customary to try the enamelled terra-cottas of Luca della Robbia, the great Florentine sculptor (1390-1482), and his followers, Andrea and Giovanni della Robbia and other members of the family, as belonging rather to the domain of sculpture than of pottery, and this is right, for there is nothing certainly known of the work of this great sculptor which connects it with painted majolica. The old theory that Luca invented the tin-glaze is long since exploded; what he did was to use coloured glazes made with a basis of tin-enamel on his boldly modelled terra-cottas—a very different thing,—and it is by no means certain that he was the first to do even that. The Victoria and Albert Museum is extraordinarily rich in della Robbia ware of every kind; and one may see there these beautifully modelled figures in high relief covered with pure white tin-enamel, set in a background of slaty blue or rich manganese purple and framed in wreaths of flowers and fruit which are coloured with blue, green, purple and sometimes yellow. There are altar vases too, of classic shape with low relief ornament, covered with the same peculiar blue glaze; these are sometimes furnished with modelled fruit and flowers; and finally there is the rare set of roundels painted on the flat with figure-subjects typifying the months; but the attribution of these remains doubtful, and their method is not that of painted majolica.

A remarkable development took place at the beginning of the 16th century, and in the forty succeeding years the highest perfection of manipulative skill, both in potting and painting, was attained. Artistically regarded, the elaborate and detailed methods of painting then adopted are too much allied to fresco-painting to be considered as fit treatment for enamelled clay; but this view was certainly not accepted at the time, nor is it subscribed to by many modern collectors; yet, regarded as decorated pottery, the 15th-century majolica, simpler and more conventional in design and treatment, is eminently preferable. The ruling families of northern Italy, who now took the industry under their personal patronage, clearly inclined to the opposite view and spared no expense to provide subjects for their
CERAMICS

With engravings by Agostino Venetiano, Marco Dente, Enea Vico and others, were copied, with more or less fidelity, on the majolica. Some of the painters, as for instance, Xanto Avelli, were eclectic in their tastes and made up their subjects by taking a figure here or there from various pictures. Thus of three figures on a plate in the British Museum, painted with the Dream of Astyages, one is borrowed from Raphael and another from Mantegna. These "istoriati" wares reached their zenith at Urbino between the years 1530 and 1560, when the workshops of the Fontana family were in full activity; but their popularity was very general, and skilful painters at many other towns produced specimens that it is hard to distinguish from those of Urbino. Baldasara Manara was a prolific painter in this style at Faenza; Pesaro and Castel Durante were little behind Urbino in the skill of their artists, the Lanfranchi family in the former town having a well-deserved reputation, while the founders of the Fontana factories learnt their art in the latter; and a few pieces of considerable merit bear the name of Rimini as their place of origin.

There will always remain a large number of specimens of majolica which cannot be assigned with certainty to any particular factory, partly because the same style of painting was in vogue at many places at the same time, and partly because of the itinerant propensities of many of the painters, whose signed works prove that they moved from place to place to practise their art. There are, however, a few prominent artists whose touch is sufficiently well known from the examples that bear their signatures to enable us to classify a considerable proportion of the finest pieces. First of these is Niccola Pellipario, the founder of the Fontana family, who moved from Castel Durante to Urbino in 1510, and worked at the latter place in the factory of his son, Guido Fontana. There is little doubt that he was the painter of the famous service in the Correr Museum at Venice, which marks the transition from the style of Faenza to that of Urbino, and his free figure-drawing, the oval faces with strongly marked classical features, the peculiarly drawn knees, the careful landscapes and the characteristic balls of cloud are easily recognized in quite a number of pieces in the British Museum (see the Gongo Este piece, Plate VI). His pupil, who frequently signed his name in full, Xanto Avelli da Rovigo, was one of the foremost Urbino painters, and his work is characterized by bold colouring and fine figure-drawing, with a marked fondness for yellowish flesh tints. But Niccola's grandson, Orazio Fontana (see example, Plate VI), was perhaps the most celebrated exponent of the pure Urbino style, and his free drawing and soft harmonious colouring, in which a brilliant blue is usually conspicuous, are unequalled by any other majolica painter of the period.

Certain characteristic wares of Faenza have already been noted. Those with the grey-blue (berettino) glaze were principally made at the factory called Casa Pirota, though inferior imitations were also produced at Padua, and a blue glaze of paler tint was largely used at Venice. Dolphins are a frequent motive in the arabesque ornaments of the same Faentine workshop, and many of the wares are marked with a circle divided by a cross and containing a dot in one of the quarters. A capital P crossed with a line or parap is another Faentine mark, and a somewhat similar monogram, with an S added to the upper part, is found in the wares of Cafaggiolo. It has already been stated that a red colour is peculiar to Faenza and in an inferior and browner tint to Cafaggiolo; it was used, according to Piccolpasso, at the factory of Vergiliotto in the former place. At Cafaggiolo, the factory of the Medici family, many fine pieces were painted, mostly in the Faentine style; a deep blue, heavily applied and showing thumb-marks of the brush, was freely used in backgrounds, and delicate running leaf scrolls in paler blue and reminiscent of

In the Urbino style, which now became general, the ware was given over entirely to pictorial subjects, scenes from history or romance, scriptural and mythological, copied from the compositions of the Italian painters and usually set in a background of Italian landscape. Guidobaldo II., duke of Urbino, spared no pains to develop this phase of the art; the cartoons of Raphael, engraved by Marc Antonio and others, were placed at the disposal of the pot-painters, as well as the paintings of Michelangelo, Giulio Romano, Battista Franco, Rosso Ross, Perugino, Parmeggiano and many more, and these, together
CERAMICS

Persian style often appear on the Caflaggiolo wares (see example, Plate VI.). Not a little can be learnt from the ornament on the reverse sides of the dishes and plates; those of Faenza and Siena are richly decorated with scale patterns and concentric bands; those of Caflaggiolo and Venice are either left blank or have one or two rings of yellow. A few pre-eminently beautiful dishes, with central figure subjects of miniature-like finish in delicate landscapes with poplar trees in a peculiar mannered style, are probably the work of M. Benedetto of Siena. Borders of arabesques with black or deep orange ground belong to the same factory and were perhaps decorated by the same hand. The dishes covered, except for a few small medallions, with interlaced oak branches ("a coroquita" decoration), are no doubt the productions of Castel Durante; and a certain class of large dishes with figure subjects in blue on a toned blue glaze, and sometimes with formal ornaments in relief, are of undisputed Venetian origin.

Another phase of majolica decoration began about the middle of the 16th century and synchronized with the decline of the pictorial style. The figure subjects were relegated to central panels or entirely replaced by small medallions, and the rest of the surface covered with fantastic figures among floral scrolls, inspired by Raphael's grotesques painted on the walls of the Loggie in the Vatican. The prevailing tone of this ornament was yellow or orange, and the tin-enamel ground, which is always more or less impure in colour on Italian pottery, was washed over with a pure milk-white, known as bianco di Ferrara or bianco allattato, said to have been invented by Alphonse I., Duke of Ferrara, who took an active interest in his private factory founded at Ferrara, and managed by potters from Faenza and Urbino.

The new style flourished at Urbino, Pesaro and Ferrara; at the first-named particularly in the workshops of the Patanazzi family, and lasted far into the 17th century. But the majolica was now in full decline, partly through the falling off of princely patronage, and partly, perhaps, owing to a reaction in favour of Chinese porcelain, which was becoming more plentiful and better known in Europe. The manufacture, however, never entirely ceased, and revivals of the old style were attempted at the end of the 17th century by Ferdinando Maria Campori of Siena, who copied Raphael's and Michelangelo's compositions, and by the families of Gentile and Gue at Naples and Castelli. The majolica of Castelli is distinguished by the lightness of the ware, good technique, and harmonious but pale and rather weak colouring; it continued into the 18th century. A coarse and inferior ware was made at Padua and Monte Lupo, and the factories of Faenza were still active, producing, among other kinds, a pure white ware with moulded scallops and gadoons. The industry continued to flourish in Venice and the north. Black ware with gilt decoration was a Venetian product of the 17th century, and at Savona and Genoa blue painted ware in imitation of Chinese blue and white porcelain made its appearance. In the 18th century a new departure was made in the introduction of enamel painting over the glaze, a method borrowed from porcelain; but this process was common to all the faience factories of Europe at the time, and though it was widely practised in Italy no special distinction was attained in any particular factory. In our own days imitations of the 16th century wares continue to be made in the factories of Ginori, Cantigalli and others, not excepting the lustred majolica of Gubbio and Deruta; but, compared with the old pieces, the modern copies are heavy to handle, stiff in drawing, suspiciously wanting in the quality of the colours and the purity of the final glaze which distinguish the work of the best period.

Lustred Wares.—The lustred wares of Deruta have marked characteristics, and, though differing in actual treatment from the Hispano-Moresque, their appearance is eloquent in favour of such a derivation. The most characteristic examples are large dishes and plateaux, thickly made and with the enamel on the upper face only, the back having a lead glaze. They are often decorated (see fig. 45) with a single figure or bust in the centre (with or without an inscribed ribbon), which is usually set against a dark blue background which covers only half the field, while in the other half is a formal flower, and in the borders are radiating panels with palmettes alternating with scale pattern, or some other formal design. The whole style is archaic, the designs being heavily outlined in blue and washed over with a greenish yellow lustre, with beautiful opalescent reflets recalling mother of pearl. The lustre varies from this madreperla tint to a brassy metallic yellow, and parts of the ornament are sometimes modelled in low relief. In spite of its archaic appearance, the Deruta lustred wares are scarcely older than the 16th century, and the style was continued as late as the second half of that century. Deruta pottery was not always lustred, and some of the pieces signed by the painter El Frate, who flourished between

FIG. 46.—Early majolica plate, in blue and yellow lustre only, made at Pesaro or Deruta, c. 1500. The motto on the scroll may be Englished as follows: "He who steers well his ship will enter the harbour." (Louvre.) 1543 and 1554, are without the lustre pigment, though showing the heavy blue outlines of the lustred wares. The lustred majolica of Gubbio owes its celebrity almost entirely to the work of one man, Maestro Giorgio Andreoli, who came thither from Pavia, with his brothers Salimbene and Giovanni, and obtained citizenship in 1548. His earliest efforts were in the direction of sculpture, and some of his reliefs in the style of della Robbia are still in existence; indeed the earliest dated piece of lustred majolica attributed to him is a plaque of 1501, with the figure of St Sebastian in relief, in the Victoria and Albert Museum. It is not known whence he learnt the secret of the beautiful transparent ruby lustre peculiar to Gubbio. A red or rosy lustre is found in both Persian and Hispano-Moresque wares, and no doubt the process was learnt from some Moslem potter and developed by Giorgio to unusual perfection. Golden, yellow, brown and opalescent lustres were also freely used at Gubbio, the ruby being only sparingly applied. Finished painted pieces were sent from other factories to receive the addition of lustre at Gubbio, but these can almost always be distinguished from the true Gubbio wares, in which the lustre is an integral part of the decoration. Apart from the lustred enrichment, the majolica of Gubbio has few distinctive qualities, for its styles were various and almost all borrowed (see fig. 47). The archaic taste of Deruta, the arabesques and grotesques of
Faenza and Castel Durante, and in a lesser degree the "istoriato" style of Urbino, reigned in turn. Perhaps the most characteristic paintings of Maestro Giorgio are the central medallions of cups and deep dishes enclosing a single figure of a child or a cupid in grisaille. Giorgio's larger figure compositions, if indeed his name perhaps derived from the Persian *dari* (a vase for drugs, &c.); other vase forms with spouts and handles were used for the same purpose; ornamental vases after classical designs (*asi a bronzi antichi*); and in the best Urbino period a great variety of fanciful forms were made—jars, cisterns, shells, salt-cellar, ink-pots, &c., with applied masks and serpentine handles, were made in the exuberant taste of the time. A complex piece of furniture for the bedside of ladies in childbirth (*vaso perleare*) consisted of a bowl with a foot surmounted by a flat trencher on which fitted an inverted drinking-bowl (*enpareca*); and above this again a salt-cellar with cover. Many of these shapes were suited to daily use, but the richly decorated majolica was designed to adorn the walls, the credenza, table-centses and cabinets of the rich. This alone could have been the reason for the large dishes (piatti di pompa) with small pieces for suspension, and the smaller dishes (coppe amatorie) with portraits of young men and girls and lovers' symbols; and it is inconceivable that the costly lustred wares of Gubbio or the fine madreperla dishes of De Tura were designed for anything but decorative purposes. The ware was in fact an article produced for the wealthy in the century of Italy's glory, and under no other conditions could such magnificent and expensive pieces have been made.

**Technical Methods.**—This is a convenient place to give an account of the methods used by the early medieval potters—(4) because they represent what had been learnt from Roman times to the 16th century, and indeed to the introduction of modern methods, (2) because, besides all that a potter could derive from an examination of the wares, the same written and accounts of the methods and processes followed by the Italian majolistic. Mr. Coton has recently published an epitome of the account given in Biringuccio's La Pyrotechnica (Venice, 1540), and there is the memorable MS. of Piccolpasso, a potter of Castel Durante. The Victoria and Albert Museum, which, besides giving an account of the processes, contains illustrations of kilns, mills, decorative motives, &c. 1

1. The potter's clay was prepared from mixtures of various kinds prepared by (a) beating and picking out coarse particles, (b) mixing with water, (c) passing through a sieve, (d) drying again into plastic clay ready for the working potter. The essential point about the potter's clay of the best tin-enamelled wares, whether Spanish, Italian, French or Dutch, is that the clays are those known geologically as "clays," and not the loam clays first imitated and then imitated of lime. Such clays always fire to a pinkish red or buff colour, and give a ware that is strong and yet light in substance, and on no other kind of clay does the tin-enamelling display its full perfection (see Deck's *La Faience*). The analyses of certain tin-enamelled wares are useful as showing the essential constitution of the best pottery bodies for such purposes.

2. **Shaping.**—The vessels were either "thrown" on the potter's wheel (which had remained practically unaltered from Egyptian times), or they were formed by "pressing" thin cakes of clay into moulds, made of a composition of plaster (*gesso*), bone-ash and marble dust. In the latter way all shapes that were not circular were made, as well as the bosses or gourdins imitated from embossed metal forms. It is interesting, though not surprising, to note that for the fine later wares, the roughly thrown wares, when sufficiently dry, were centred on the wheel or were placed in a press, and slowly forced upwards to a given size. The Greek potters did the same, and this practice must always be followed where fine painting or gilding is afterwards to be applied. In the later florid wares of the Urbino style the piece was built up of thrown parts and thus shown in the library of the Victoria and Albert Museum, piccolpasso made, attached together with slip when they were dry enough to be safely handled, and then retouched by the modeller or vase-maker, a method followed to this day for elaborate pieces of pottery or porcelain.

3. **The Glaze.**—The white enamel which formed at first both the glaze and the ground for painting upon—*bianco*, as it was called—was prepared in a complicated way. A clear potash glass (*marascoto*) was made by melting together clean silica sand (*arena*), and the potash component, as the leaves of wine (*focico*). This corresponds to the alkaline glaze of the Egyptians with the substitution of potash for soda. Such a glaze alone would have been useless to the Italian potter, and accordingly the *bianco* was made by melting together...

thirty parts of **murrattolo** and twelve parts of lead and tin ashes. The white enamel was used therefore a mixed silicate of lead and potash rendered opaque with oxide of tin.

4. Pigments were composed of metallic oxides or earths, with the principal of these being iron, which was used with oxide of iron to give orange; the green, from oxide of copper (the turquoise tint given to the Egyptian and Syrian glazes by oxide of copper is impossible with a glaze of lead and tin); and the greens which were made of oxide of iron, blue, from oxide of cobalt, used in the form of a blue glass, and brown, from mixtures of other colours, and the rare red, or reddish brown, from oxides of iron, manganese, and cobalt. Cobalt oxide was used in small quantities, and a blue that was used so magnificently by the makers of the Turkish pottery, but on the white enamel ground this colour was most treacherous and uncertain. It must be remembered that many of the pigments were compounded by themselves or others before their application to the grounds containing oxides of lead and tin on which they were painted. Piccolpasso describes the preparation and composition of the various colours used in his day.

5. Ce blue is a transparent glaze. In the later majolica a thin coating of soft rich glaze was applied over the fired painting to give a smooth bright surface. This *coperta* was a soft lead glass consisting of silica (sand), 20 parts; oxide of lead, 17 parts; potash, 12 parts; alumina, 4 parts; sodium oxide, 8 parts; fused together and then finely ground in water.

6. Methods of Glazing and Decorating. — In the mezza-majolica and the early majolica it is probable that the clay vessel was dipped in the white bath to give it an envelope (impristitura) before it was fired at a moderate temperature, but there are not enough examples which have been recorded to be certain. It is better to fire the first painted vessel until it was about as hard and brittle as a clay tobacco-pipe, and then coat it with the white enamel, by dipping it into a bath or pouring the fluid material upon it. This was done by Franchet of Florence. After this the thickness of glaze required, having been obtained, the piece was carefully taken by the painter, who first etched in the outline on the absorbent powdery ground, and then shaded the figures, landscapes, &c., in blue or in a mixture of blue and yellow, adding shading, and colours as gradated washes. The vase was then fired a second time to a heat greater than the first, so that the enamel was melted on the vessel and the colours sunk into the enamel at one and the same time. This method of painting on the unbacked enamels has demanded a bold direct treatment—for alteration or retouching was impossible—and much of the vigour of the earlier designs is due to this fact. As the ware became more refined in its treatment it was fired a third time in the cooler parts of the kiln. The paint was then dried and fired a second time, and the piece was fired a third time in the cooler parts of the kiln. In some instances it is not easy even for an experienced potter to decide which method has been pursued, owing to the softening of the colours. Generally we are dealing with a later period of majolica, and the pieces painted on a ground of fired white enamel, and we may be absolutely certain when delicate white patterns have been "picked out" in a coloured ground.

Pictorial decoration has been added to a piece of majolica, it indicates, as elsewhere, the use of a special process, and a final firing at a lower heat. The lustre pigments were the same as those used on the earlier lustred wares, and these were painted over a transparent glaze, and fired again. To obtain the lustre effect the vessel was placed in a special kiln, so contrived that when the pots were just visible red the smoke of the burning fuel (rosemary or gorse) was allowed to play upon them long enough to drive the metallic films (silver, gold, or copper) already formed into a network of threads. Collections.—The Victoria and Albert Museum contains perhaps the most widely representative collection in the world, especially as at the present time the pieces of the Salting and Pierpont Morgan collections are in exhibition there. The British Museum collection is valuable, being rich in "impressionis," and the first quality wall-pieces and the Ashmolean Museum at Oxford (Fortnum collection, &c.) are also valuable and contain some remarkable examples. The Cluny Museum, the Louvre and the museum at Siena (Museo dell’Opera del Duomo) have both remarkable collections. As early as 1880, new specimens of which are now valued at more than their weight in small Italian towns. The American museums, especially those in New York, Boston and Philadelphia, have some fine examples.

FRENCH POTTERY FROM THE 15TH TO THE 19TH CENTURY

The pottery of medieval France needs little attention here, for it was, in the main, similar to that which was made generally in Europe—rudely shaped vessels of ordinary clay often decorated with modelled ornament and glazed with yellow or brown lead glaze, or, if coated with white slip, decorated with bright green glazes, and towards the end of the 15th century with greyish blue. The later specimens of this simple ware—pronouncedly Gothic in feeling—were often extremely decorative. Avignon, Beauvais and Savigny are the best-known centres of this truly national manufacture, and, as we might expect in French work, the reliefs are often sharp and well designed. Evidence accumulates that from time to time the princes and great nobles imported Spanish or Italian workmen to make special tiles for the decoration of their palaces or chapels. The duke of Burgundy brought Jehan de Moustiers and Jehan-le-Voleur, "... et divers peint à fond jaill..." in 1391, to paint tiles for his palaces at Hesdin and Arras in the north, and we have already referred to the tile-work in the Spanish fashion made at Poitiers by John of Valencia, the "Saracen," in 1584 for Duke Jean de Berry. Other instances might be multiplied but that this foreign work left little or no traces on contemporary French pottery. Even at a later date, when Francis I. brought Girolamo della Robbia from Florence to decorate his "Petit Château de Madrid" in 1539, or when Masseot Abaqueens, about 1542, manufactured at Rouen the painted tile pavements for the château of Écouen, the cathedral of Langres, and other places, nothing came of the imported methods; the works were executed and left no traces on the general pottery of the country. During the 16th century, however, two remarkable kinds of pottery were made in France of distinctive quality, and both eminently French—the Henri-Deuxian and the potteries of Bernard Palissy and his imitators. *Heart-Dieu, Orvilliers, and Paris*. The names have in turn been applied to the enigmatic and wonderful pottery, specimens of which are now valued at more than their weight in

CERAMICS

left no permanent impression on the general trend of French pottery.

Meantime Italian, and, it may be, Spanish potters strayed over the French border and attempted to introduce the manufacture of their tin-enamelled wares; for we know of the works of Gambin and Tardessir of Faenza, established at Lyons about 1556; of Sigalon at Nîmes in 1548; of Jehan Ferro at Nantes about 1580, and other sporadic efforts. The needed impetus came, however, when the Mantuan duke, Louis de Gonzague, became duke of Nevers in 1565; and we find Italian majolists, working under princely patronage, planting their decadent art in the centre of France. The first efforts met with little success until, with the appearance of the Conrads from Savona, who were domiciled in Nevers in 1602, we get the genuine ware of Nevers. Naturally the first productions, whether of the Conrads or their predecessors, were in the style of the debased majolica of Savona, but the body and glaze of the ware is harder, the colours are not so rich, and the execution is less spirited. The first departure from Italian traditions is seen in the ware of the so-called "Persian style" of Nevers—probably adopted from contemporary work in Limoges enamels on metal—where conventional and fanciful designs of flowers and foliage, birds, animals or figures were thickly raised in white enamel on a ground of bright, intense cobalt-blue glaze. After the middle of the 17th century the Italian style of design appears to have been entirely replaced by pseudo-oriental patterns painted in blue or in polychrome, but really imitated from the "Delft" copies of Chinese and Japanese porcelain. When Rouen and Moustiers became famous for their distinctive wares Nevers copied their designs also, and, on a gradually descending scale the manufacture continued to the end of the 18th century, when

Fig. 48.—Tazza of Oiron pottery. (Louvre.)

ornamented with interlacing strap-work patterns, typical of the period, inlaid in yellow, buff or dark-brown clay. The forms are generally graceful, but some examples are over-elaborate and overloaded with modelled ornament. The pieces were designed to serve as candlesticks, salt-cellars, tazzas, ewers, holy-water pots and dishes. After the vessels had been "thrown" and "turned" to a perfect shape, metal tools, such as were used by the bookbinders and casemakers of that day, were pressed into the clay, so as to form sunk cells of ornamental tooling. These cells were carefully filled with finely-prepared slips of other clays, that would burn yellow, buff or dark-brown; and when the whole was dry the piece was carefully smoothed again, and moulded reliefs were attached, or touches of colour were applied. After being fired the ware was glazed, apparently with the ordinary lead glaze of the time carefully prepared and fired again. At a later period the ware was not inlaid in this elaborate manner, but was simply painted, as indeed it might all have been so far as decorative effect is concerned.

Palissy Ware.—Bernard Palissy was a genius of original talent, but, at the hands of his literary admirers, he has gained a legendary rank as one of the great potters of the world which his pottery does not warrant. He is supposed to have spent sixteen years in the search for the white enamel, which being used all the time in Italy and Spain—probably he was searching for the mystery of Chinese porcelain—and when he settled down to make the "Palissy ware," he did nothing more than carry to perfection the methods of the village pot-makers of his own district. On a hard-fired red clay he disposed groups of moulded plants, shells, fish and reptiles, painted them with crude green, brown and yellow colours, and glazed the whole with a well-prepared lead glaze. His style soon had numerous imitators, like A. Clérisy and B. de Blémont, who executed works quite as good as those of their master; but their works also vanished and

1 See B. Fillon, Les Faïences d'Oiron (1862).
2 See E. Bonnafe, Les Faïences de Saint-Porchaire (1898).
Quimper, Lille, and other places in the north. Saint Cloud and Lille made fine pottery of this kind at the end of the 17th and in the early 18th century. It was imitated at Nevers, the potters' marks shown being those of J. Bourdil and H. Borne. In the south of France, Pierre Clérissy established the industry at Moustiers in 1686, and, though the early Moustiers wares bear a strong resemblance to the debased Italian majolica of the time, the Moustiers painters soon left that behind, and on a glaze of inimitable whiteness and softness they deftly pencilled blue patterns based on the engravings of designs after Benain, Marot and Toro. At a later date Olyers, who had been to Alcoa to introduce the French faience into Spain, returned to Moustiers and introduced a pale polychrome style very inferior to that of Rouen. These pieces are covered with patterns outlined in blue and filled in with yellow, pale green and light purple. Olyers is also said to have introduced the grotesque style of Moustiers, founded on the caricatures of Callot. Other factories were started from Moustiers, such as those at Apt, Ards and Montauban, and even at Narbonne, Bordeaux and Clermont-Ferrand; just as the northern factories had sprung from Rouen.

We have already seen at Nevers the introduction of patterns in the Chinese style, and the same course was increasingly followed at all the French factories during the 18th century. At Strasbourg a fresh impetus was given in this direction when, about 1721, Charles Hannong introduced the practice of painting his white tin-enamelled ware with the on-glaze colours used by the porcelain painters. This process enabled the French potter to produce many colours unobtainable by his older process, and moreover helped him to make his wares look more like the coveted porcelain, then becoming the rage all over Europe. This new departure marks the end of the best period of French faience, but so successfully did it meet the demands of the time, that it gradually displaced the old method of decoration where the colours were painted on the raw glaze and fired along with it. Factories sprang up for the manufacture of this new ware in the first half of the 18th century at Niederviller, Lunéville and Sceaux, and it was quickly adopted by the older factories at Rouen, Sinceny, Marseilles, &c. With its general adoption the old French faience, developed from the Italian stock, departed, to make way for a tin-enamelled imitation of famille-rose porcelain. But this last style was not of long life. The wealthy classes were no longer patrons of pottery but of porcelain, and when, after 1786, the newly perfected English earthenware was thrown upon the French market, the French faience-makers had to give up their works, or adopt the manufacture of this newer and, for domestic purposes, more suitable form of pottery. This change, together with the disturbances of revolutionary times, brought the industry to a standstill, and we shall only hear of its revival during the last forty or fifty years in a subsequent section.

Collections.—The Victoria and Albert Museum and the British Museum contain typical examples of this ware, a few, to be seen in the Cluny Museum, the Louvre, the museum at Sèvres, or the French provincial museums at Rouen, Limoges, Marseilles, Lille, St Omer, &c. The Victoria and Albert Museum Handbook, 1884; Le Breton, Le Musée céramique de Rouen (Rouen, 1883); Milet, (4) Histoire de la faïence et de la porcelaine de Rouen (Rouen, 1898); Portier, Histoire de la faïence de Rouen (Amiens, 1870); L'Abbé H. Requin, Histoire de la faience artistique de Moustiers, tome 1er (Paris, 1903); M. L. Solon, The Old French Faience (London, 1903)—the best survey of the whole subject, with a very full bibliography. The various volumes of the Gazette des beauxarts contain many valuable original articles. (W. B.)*

GERMAN, DUTCH AND SCANDINAVIAN POTTERY

In northern Europe until the time of the Renaissance the making of tiles is the only branch of the potter's craft of artistic rank. The pavement tiles of Germany of the Gothic period, examples of which have been found in the valley of the Rhine from Constance to Cologne, often bear designs of foliage or grotesque animals full of character and spirit. Their decoration is effected either by impression with a stamp of wood or clay, or by “pressing” the tile in a mould to produce a design in relief. The surface is sometimes protected by a lead glaze—green, brown or yellow—but is generally left unglazed.

Glazed tiles with relief ornament were also made as early as the 14th century for the construction of stoves, such as have continued in use in Germany to the present day. About 1500 a development took place in the combination of glazes of different colours on a single tile. In the middle of the 16th century Renaissance ornament appears in place of Gothic canopies and tracery, and blue and white enamels begin to be used in combination with lead glazes of other colours. Figures in the costume of the period, or shields of arms, in round-arched niches are a favourite motive alike in the stove tiles and in the wares of similar technique known as Hafnerglaüse, which have been wrongly attributed to Hirsvogel of Nuremberg. These were made not only in that city but also in Silesia and at Salzburg, Steyr, and elsewhere in Upper Austria; their manufacture continued into the 18th century.

Imitations of Italian majolica with polychrome painting upon a white enamelled ground were first made in southern Germany about 1525, and it is with these wares that the name of Hirsvogel should really be associated. The same style survived for more than a century and a half in the stoves and pottery made by the Plau family at Winterthur in Switzerland, from the end of the 16th century onwards. An interesting development is exhibited by certain rare productions, of Silesian origin, dating from about 1530, with decorations in coloured enamels which are prevented from flowing together by a strong outline incised in the clay.

Stoneware.—The most important feature of the history of German pottery is the development of stoneware along the valley of the Rhin, and its use as a vehicle of the finest and most delicate of all painted wares. The earliest attempt was the introduction of a refractory white or grey body of intense hardness, glazed by the addition of salt to the kiln when the highest temperature was reached. It was exported in large quantities through the markets of Cologne and Aachen (Aix-la-Chapelle) to England, France and other parts of northern Europe. The frequent occurrence in its decoration of the arms of foreign cities and princes shows that the German potters were alive to the requirements of foreign customers.

The oldest centre of this manufacture seems to have been at Siegburg near Coblenz, where the white stoneware peculiar to the neighbourhood, made from local clay, must have been made and exported in considerable quantities at least as early as the 15th century; plain beer-jugs of that date with cylindrical neck and slightly swelling body have been unearthed in London and the eastern counties of England. In the 16th century an artistic development took place, and the potters were formed into an exclusive guild under stringent regulations. The manufacture lasted till the sack of the town by the French in 1632, subsequent attempts to re-establish it being unsuccessful. A variety of a creamy white colour, generally thinly glazed and only rarely coloured by staining with cobalt blue, is decorated by impression with small stamps or by the application of reliefs pressed from separate moulds. The motives include sacred and classical figure subjects, portraits of contemporary sovereigns, and armorial bearings, with accessory foliage in which a survival of Gothic feeling is often perceptible. Characteristic forms are the high tankard (Schnelle) and the ewer with long spout (Schnabelbrug), but the fancy of the potter also found expression in various quaint or extravagant forms.

At Raeren in the duchy of Limburg this industry attained importance about 1530, and was continued for over seventy years; 1530 is the earliest date known to occur on this ware. The pieces were of two kinds, brown-glazed and grey; the latter were usually decorated with blue. The favourite form is a baluster-shaped jug with heraldic designs or a frieze of figures round the middle. The subjects are from Scripture history or contemporary peasant life as interpreted by Hans Sebald Beham and the German and French "Little Masters." Examples are known
CERAMICS

BEARING dates and names or initials of mould-cutters, among them Jan Emens and Baldem Mennikhen; but it must not always be inferred that a piece is as old as the date introduced in its decoration, for the same set of moulds might be used for many years.

Another important centre in the 16th century was at Frechen near Cologne. Round-bellied jugs known as Bartmänner, from the bearded mask applied in front of the neck, covered with a brown glaze, which in later examples is often coagulated into thick spots, were first made here towards the end of the 15th century, and continued to be the staple product well into the 17th. The jugs of this type, known as Greybeards or Bellarmines, which were exported in profusion to England, Scandinavia and the Low Countries, were mostly made here. At Cologne itself there were also factories, probably before the 16th century, the later productions of which resemble those of Frechen.

During the 17th and 18th centuries the busiest stoneware centre was the district surrounding Höhr-Grenzhausen in Nassau known as the Kannebäckerländchen, where artistic ware was being made before 1600. Soon after that date manganese purple was first used in the decoration in addition to cobalt blue, and henceforward colour in combination with impressed and incised ornament tended more and more to supersede decoration in relief. Figure subjects gave place to rosettes, foliage on wavy stems, and geometrical patterns. Vessels of large size and fantastic shape appear beside the standard forms of the earlier factories. In the 18th century the forms of beer-vessels became stereotyped in the globular jug with cylindrical neck and the cylindrical tankard, while tea and coffee pots, inkstands and other vessels, hitherto unknown, began to be made. A stoneware manufacture dating back to the middle ages existed at Creussen in Bavaria. The productions of this district during the 17th and 18th centuries consisted chiefly of large drinking-jugs and jugs and jars, of a dark red body, covered with a lustrous dark brown glaze, frequently painted after the first firing in brilliant coloured enamels with figures of the Apostles, the electors of the Empire, or other oft-repeated motives. Imitations of the wares of Raeren and Grenzhausen were made at Boufioux near Charleroi; other minor centres of the manufacture were at Meckenheim near Cologne and Bunzlau in Silesia.

As in England, so in Holland (by Ary de Milde and certain Delft potters) and in Germany, attempts were made with some success, early in the 18th century, to imitate the Chinese red stoneware, known as "boecares." The early efforts of Böttger, the discoverer of the secret of true porcelain, at Meissen, belong to this category. His red ware is of such hardness that it was cut and polished on the lapidary's wheel. For some time after the manufacture of red ware at Meissen had ceased, a glazed brown ware of less hard body with gilt or silver decoration was made at Bayreuth. The products of other minor factories of this class cannot now be identified.

Mention may be made of the lead-glazed peasant pottery, such as the bowls produced at Marburg with quaint symbolic devices modelled in relief and applied. Slip-covered wares with graffito decoration, apparently of indigenous growth and not inspired by foreign examples, were made well on into the 19th century near Crefeld and elsewhere in Germany, at Langnau in Switzerland, and by German emigrants in Pennsylvania. In Holland a peculiar green-glazed ware was made in the 18th century with pierced geometrical decoration recalling the Dutch carved woodwork of the period.

Delft.—One of the most remarkable phenomena in the history of pottery is the appearance about 1650, in a highly developed state, of the manufacture of a tin-enamelled earthenware at Delft. It was introduced in that town by Herman Pietersz. de Haarlem, but whence he learned his art is unknown. The faience-makers (plateelbakkers) were one of the eight crafts of Delft which formed the Gild of St Luke founded in 1611. About 1650 a great development took place, and till the latter years of the 18th century, when its faience was ousted by the more serviceable wares of the English potteries, Delft remained the most important centre of ceramic industry in northern Europe. The ware is of fine buff-coloured clay, dipped after the first firing in a white tin-enamel, which formed the ground for painted decoration; after painting, this was covered with a transparent lead glaze and fired a second time, so that in its technique it belongs to the same class as the painted Italian maiolica and the old French faience. At its best it is rightly ranked among the greatest achievements of the potter's art.

Characteristic of the first period are dishes and plaques in blue monochrome with somewhat overcrowded scenes of popular life in the style of the engravings of Goltzius. Imitations of the oriental porcelain imported by the Dutch East India Company were introduced about 1650 by Aelbert de Keizer and continued for some time among the finest productions. At the same time the earlier tradition was developed in the finely painted landscapes and portraits of Abraham de Kooge and Frederik van Frytom. Other potters of the best period were Lambartus van Eenborn and Louwys Fictoor, makers of the large reeded vases with Chinese floral designs in polychrome, Augustyn Reygens, Adriaen Pynacker, and Lucas van Dale; to the last are attributed the pieces with yellow decoration on an olive-green enamel ground. The rare examples with polychrome decoration on a black ground in imitation of Chinese lacquer are the work of Fictoor and Pynacker. With the 18th century came a largely increased demand and a consequent deterioration in artistic quality. The rise of the German porcelain factories has its effect in the introduction of overglaze painting fired in a muffle kiln, typified by the work of the Dextras, father and son. This innovation, by which the Delft potters attempted to compete with European porcelain, contributed to the ruin of their art by eliminating the skilled touch required for painting on the unfired enamel. The ware frequently, but not invariably, bears a mark derived from the sign of the factory ("the eagle", the peacock, the three bbls, &c.), or the name or initials of its proprietor.

A small faience factory was started by Jan van Kerkhoff about 1755 at Arnhem; its productions were of good quality, chiefly in the rococo style, marked with a cock.

The exportation of the Delft ware to Germany occasioned the rise of numerous factories in that country for making faience in imitation of the Dutch. Among these may be named Hanau (founded about 1670), Frankfurt and Cassel. Others, such as Kiel and Stralsund, drew their inspiration from the productions of Marseilles and Strassburg (q.v.). At Nuremberg a factory was founded in 1712, which was but little affected by extraneous influences; among its characteristic productions are dishes with sunk decoration in the form of a star, and jugs with long necks and pear-shaped bodies, often spirally fluted. Similar wares were made at Bayreuth. The Dutch and French styles were carried by German potters into Scandinavia; factories were established at Copenhagen in 1722, at Röstrand and Marieberg near Stockholm in 1728 and 1758, and at Herreböe in Norway about 1759.

At the close of the 18th century the influence of imported English earthenware was strongly felt. In Holland workshops were established for painting the English cream-coloured ware with subjects suited to the Dutch taste; and in Germany cream-coloured wares and "steinig" in imitation of Wedgwood's productions were manufactured at Cassel, Proskaue and elsewhere. The "Delft" ware of Holland during the 17th century was a beautiful decorative ware, in which the Dutch painters caught successfully the spirit, and often the very colour value, of Chinese blue and white porcelain. Its fame spread over the whole of Europe, and its styles were readily imitated by the potters of all other countries who made a similar ware. Even the polychrome Delft, though not nearly so beautiful as the "blue and white," is strongly decorative, and one sees in the polychrome faience of northern France and of Germany more than a trace of its influence. When this ware was supplanted by English earthenware it was a clear instance of a ware that was technically superior displacing a more artistic product.

Collections.—For German wares the German museums are naturally best. The museums at Munich and Nuremberg contain splendid collections of the tin-enamelled and peasant wares of South Germany, Cologne has a wonderful collection of the Rhenish stoneware, and Berlin and Hamburg have good general collections. Copenhagen and Stockholm are especially good for Scandinavian wares, and Zürich for Swiss. There are also good collections of German stoneware in the Victoria and Albert and the British museums, and in the Cluny Museum, the Louvre, and the museum at Sèvres; but there are some remarkable collections of the German tin-enamelled wares out of Germany. The wares of Delft may be best studied in the museums at the Hague and Amsterdam. There is an interesting collection at the factory of Thoet and Labouchère in Delft. The principal museums in England, France, and Germany all have fair to good collections of this renowned ware.

Literature.—For tile and peasant pottery, see Forrer, Geschichte der europäischen Fliesen-Keramik (Strassburg, 1900; chapters on the Netherlands and Germany); Walcher von Molthen, Bunte Hafnerkeramik der Renaissance in Österreich oder Erz in Salzburg (Vienna, 1906); Hafner, Das Hafnerhandwerk and die alten Ofen in Winterthur (Winterthur, 1876–177); Barber, Thulitw, Das Meissner Porzellan der Pennsylvania German Potters (Philadelphia, 1903). For stoneware, see Solon, The Ancient Art Stoneware of the Low Countries and Germany (London, 1892); Van Bastelaer, Les Grès wallons (Mons, 1889). For Böttger's red ware, see Berling, Das Meissner Porzellan (Leipzig, 1900), chap. iii. For Dutch faience, see Havard, Histoire de la faïence de Delft (Paris, 1878), and article by same author on "La Faïence de Delft" in the Berichte der Deutschen und Oesterreichischen Museums (vol. xx. 1879). For German faience, see von Falk, Majolica (Berlin, 1896), and articles by Stieda, "Deutsche Fayencefabriken des 18. Jahrhunderts," in Keramische Monatshefte, vols. ii. and iii. For Sor Mexican pottery, see Nasar, La Pintura Mexicana (Mexico City, 1903). For Spanish pottery, see Niedrach, Historische Fayence in Hispanien (Copenhagen, 1881); Sträle, Rötscher et Marieberg (Stockholm, 1872); Grosse, Herrenfüllner (Christiania, 1901). Excellent accounts of most branches of the subjects are given by Brinkmann, Das burgundeische Porzellan (Munich, 1894).

Later Wares of Spain and Portugal

We shall only deal at length here with those important kinds of pottery that have exerted real influence on the historical development of the art. Offshoots from the main stem that have developed little or no individuality can only be briefly mentioned. When the characteristic Spanish-Moorish lustre wares ceased to be desired by the wealthy they rapidly sank into insignificance, though as a decorative peasant pottery their manufacture never really ceased and has been revived again in our day. The course of pottery importation was changed and the nation fashionable Italian majolica was brought into Spain in the 16th and 17th centuries. These Hispano-Moresque wares had followed, in all probability, an opposite course two centuries earlier. Besides the influence which these imported wares had on the Spanish potters, a number of wandering Italian majolists found their way into Spain, so that we find the use of painted colour, particularly blue, yellow, orange, green and purple, making its appearance at various centres, around Valencia, at Triana near Seville, &c., but the most important manufacture was at Talavera in the centre of the peninsula. The best of this ware recalls the late Italian majolica of Savona, and the influence of Chinese porcelain designs, probably filtered through to the Spanish potters by the then popular enamelled Delft wares, is very apparent. The potteries of Talavera are mentioned as early as 1580, and they continued at work, with varying fortunes, down to the end of the 18th century. Many and varied wares were produced, including tiles as well as pottery; the most common pottery pieces are dishes, bowls, vases, tinajas, holy-water vessels, drugpots, and hanging flower vases, together with moulded and painted staves, dogs, oranges, almonds, walnuts, and every kind of fruit. Apart from the poorer colour the baroque style of ornament also rendered the ware much inferior to that of Italy or of France. The popular Talavera wares were imitated elsewhere in Spain, and a number of factories existed at Toledo in the 17th century, but their wares are very inferior. In the 18th century, besides debased imitations of this ware, some coarse but striking pottery was made at Puente del Arzobispo near Toledo.

An interesting offshoot from the Talavera potteries is to be found in the tin-enamelled wares made at Puebla, Mexico, from the early 17th century. It is said that Spanish wares were settled at this place by the Dominicans soon after 1600; and the making of a debased form of Spanish majolica continued there for nearly two centuries. See Barber’s " Tin-Enamelled Pottery," Bulletin of the Philadelphia Museum, 1907. During the 18th century determined efforts were made by King Charles III. and by the famous Count Aranda to improve the Spanish pottery wares, as well as to introduce the manufacture of porcelain. The efforts of the king led to the foundation of the porcelain works at Buene Retiro near Madrid, which will be mentioned later, and considerable success also attended the revival of strong copper lustre, like that of the late Hispano-Moresque wares; but the finest tin-enamelled wares were those made at Alcora in the important factory founded by Count Aranda in 1726, which continued in operation down to the French wars. For his purposes the count brought from Moustiers, then one of the famous French pottery centres (see above), Joseph Olyers, a well-known pot-painter. He went to Alcora as chief draughtsman and designer, having charge of a number of Spanish potters and painters. Olyers introduced the Moustiers style of decoration, and the glazed and body of the Alcora wares of the best period reflect the fine quality of Moustiers faience. It is only fair to add that Olyers in his turn learnt the use of various delicate yellow and green colours from the Spaniards, and when he returned to France in 1727, the count was induced to employ him. He introduced this new style of delicate polychrome decoration at Moustiers. The mixture of motives and ideas that animated the duke and his potters may be seen by the following list of wares produced about 1750. Vases of different shapes; small teapots; teapots and covers, Chinese fashion; teapot and covers, Dutch fashion; cups, Chinese style; entrée dishes; salt-cellars, Chinese style; escudillas (bowls) of Constantinople; barquillos (saucers); cups, plates, and saucers of different kinds with good painted borders in imitation of lace-work, and finally fruit-stands, salad-bowls and dishes, trays and refrigerators. Later in the century the manufacture of porcelain was introduced here, as well as white earthenware made in imitation of the productions of Wedgwood, and the tin-enamelled wares flickered out in Spain as they did elsewhere.

The manufacture of a kind of debased majolica was also practiced in Portugal from the 16th century down to our own times; but the ware never attained to any distinction and is little known outside that country. The best-known specimens were made at Rato, near Lisbon, where a factory was founded in 1767 under the patronage of the Prince Regent.

Mention must be made of the unglazed native pottery of Spain and Portugal, for wine-jars, water-jars and bottles, cooking pots, and other domestic utensils are still made in these countries for ordinary domestic use, in traditional forms and by methods of the most primitive kind. Many of these vessels, especially the tinajas (wine-jars) and water-coolers, are based on ancient, classical or Arab forms, and in every country-market-place it is still common to see groups of vessels, in unglazed pottery of fine shape and finish, exposed for sale—a very different state of things from what obtains in France, Germany, and particularly in England, where the primitive methods of the peasant are being imitated by those who ought to know better. From the 16th to the 18th century a special kind of unglazed pottery vessels known as bucares was extensively made both in Spain and Portugal. The body of the ware was unglazed, whitish, black or red, according to the special kind of clay. The curious point about this ware is that, if we may believe contemporary documents, the vessels were delicately scented, like a ware imported from Mexico; and the soft vessels are said to have been eaten—a custom common enough in certain parts of Central and Southern America. (See M. L. Solon, The Noble Buccares, 1906.)

English Pottery from the 16th to the 19th Century

The course of pottery manufacture in England followed, generally rather in the rear, that of France, Germany and other northern countries. Before the coming of the Romans much pottery of the late Stone age and the Bronze age was made in

1 See examples in colour, Plate X.
Britain. The Romans introduced their more advanced technique, and, besides importing Italian and Gaulish pottery, they founded numerous centres of pottery manufacture, as at Upchurch, Castor, Uricionum, &c. With the departure of the Roman legions their simple, yet comparatively advanced, pottery vanished, and Saxony and early Norman times have left us little but wares resembling those of the Germanic and Frankish products (fig. 50). The early middle ages passed without much improvement, and, though rare specimens—like the ewer in

the form of a mounted knight in Salisbury Museum—proved that glazed wares were made in this country, the general run of our medieval pottery vessels never soared above the skill of the travelling brick or tile maker. The monastic tile-makers, with their strong, Gothic tile pavements, produced artistic work of a very high order; but the patrons of the common potter remained content with his rudely made and simply glazed pitchers, flagons, dishes and mugs (see fig. 51). Even in the 16th century the excellence of English pewter probably acted as a barrier to the introduction of finer pottery, and it was only the importation of foreign wares—Italian, Dutch, and French—that stirred up our native clay-workers to the possibilities of their art. In early Tudor times there was some importation of Italian majolica as well as of the Hispano-Moresque pieces, and the religious wars as well as the constant intercourse with the Low Countries brought over to the eastern counties not only the stonewares of the Rhineland and the “Delft” wares of Holland, but also emigrant potters from those countries who tried to practise their native crafts amongst us. The Civil War appears to have been unable to check this new spirit, for we have the evidence of dated examples to show that various immigrants went on quietly practising their trade along the Thames side, in what were then the outskirts of London, and probably in the eastern counties and Kent as well. It seems probable that the earliest influence was an Italian one, but before this was firmly domiciled it was supplemented by that of the Dutch and Germans. The first wares of an improved kind that were made in England are so closely related to the German stonewares and the “Delft” wares that it is often difficult to determine whether actual specimens are of English or foreign origin. The first, and in some senses the greatest, of English potters was John Dwight, an educated man,

who had held the office of secretary to three successive bishops of Chester, and who obtained a patent in 1671 for the manufacture of certain improved kinds of pottery. We have no knowledge where Dwight acquired his skill in the potter’s art, for when he obtained his patent he was residing at Wigan (Lancashire), far removed from the districts where foreign potters had settled. About 1672–1673 Dwight set up a factory at Fulham, where he resided till his death in 1703. He was always an eager experimenter, and from his diaries it seems certain that he was searching after the, then, mysterious Chinese porcelain. We have no grounds for believing that he ever attained success in this search, for his known productions may be grouped into two main classes: (1) Hard-fired red stoneware—mostly small vessels, teapots, mugs, &c., in imitation of the Chinese buccaros. (2) Whitish, grey, or drab salt-glazed stoneware made in imitation of, and often not to be distinguished from, the wares of the Rhineland. But Dwight produced a considerable number of modelled portrait-busts, statuettes, &c., all in stoneware of various tints, which entitle him to a place in the very first rank of potters. The portrait-bust of Prince Rupert (British Museum), the statuette of Mr. Manager (British Museum), of Jupiter (Liverpool), &c., are worthy of a sculptor of the Italian Renaissance, while the recumbent effigy of Lydia Dwight (Victoria and Albert Museum) is one of the most beautiful works ever executed by an English potter.

Meantime the manufacture of tin-enamelled pottery, in the style of “Delft,” was prosecuted with increasing industry in London on the south side of the river, and particularly at Lambeth. By the end of the 17th century the same imitation “Delft” wares were made at Bristol and Liverpool, continuing until, in the closing years of the 18th century, tin-enamelled earthenware was abandoned in favour of the perfected English cream-colour. There is a strong family likeness in all this English “Delft,” whether made at Lambeth, Bristol, or Liverpool. The body of the ware is harder and denser than in the tin-enamelled wares of the continent, and is not so suitable for its special purpose, as it is generally deficient in lime. The decoration is usually painted in cobalt blue of good tone, though inferior in softness and richness of tint to that of the best Delft pieces; polychrome painting was not so common, and it differs from those of the Dutchmen in the greater prevalence of a pale yellow colour and the general absence of any good red like that found on the polychrome wares of Delft, Rouen, &c.

German stoneware also received a well-merited share of attention long before the time of Dwight, and it is often impossible to distinguish the grey and brown ale-jugs, greybeards, &c., presumably of English manufacture in the 17th and early 18th centuries, from their German prototypes. Fulham remained an important centre of this manufacture, and a fine brown stoneware was largely made at Nottingham as early as 1700; in each case the manufacture continues in neighbouring districts to this day.

The development of a native English pottery took place in North Staffordshire. A growing community of peasant potters, who manufactured some strongly decorative English wares by very simple means, was established here from the middle of the 17th century. Rudely fashioned dishes, jugs, bottles, &c., were shaped in the local red-burning brick clays, and, while the pieces were still soft, simple but effective decorative patterns were drawn upon them in diluted white clay (slip), trailed on through a quil or from a narrow-spouted vessel. This ancient and world-wide process (for it was used by the Ptolemaic Egyptian, the Roman and the Byzantine potters) has furnished the peasant potters of every European country with characteristic wares, but nowhere was it used with greater skill than in England. The English slip-decorated wares are often spoken of as “Toft Ware,” because Thomas Toft, living in what is now Hanley (Staffordshire) boldly signed and dated many of his pieces (1670, &c.); but similar wares were made at Wrotham in Kent, in Derbyshire, Wales and elsewhere. The repute of

An excellent summary of the remains of English medieval pottery will be found in Hobson’s “Medieval Pottery found in England,” Archaeological Journal, vol. ix.
the Staffordshire district must have spread by the time of the Revolution, for soon after 1690 John Philip Elers, a Dutchman of good family, settled there and began to make a superior pottery to any previously made in the district. Elers is historically described as a great inventor who brought all kinds of knowledge into the district, but the only wares he is known to have made were similarly like those of Dwight, and, quite recently, records of a lawsuit in which Dwight charged Elers and some other Staffordshire potters with suborning his workmen and infringing his patents have been brought to light. It is certain that, from the time of Elers, the Staffordshire potters made great advances in the fabrication of their wares, and during the 18th century they evolved two distinctively English kinds of pottery, (1) the white and drab salt-glaze, (2) English earthenware.

**Staffordshire Salt-glaze.**—It is uncertain when and how the Staffordshire potters learnt that a highly siliceous pottery could be glazed by throwing common salt into the kiln at the height of the firing, for the practice had originated in the Rhineland more than a century before. Many writers have maintained that the practice was introduced by Elers, but this is uncertain. Early in the 18th century a fine, white, thin, salt-glazed ware was made in Staffordshire, in many quaint and fanciful forms largely influenced by Chinese porcelain—still an object of wonder and mystery. Teapots, coffee-pots, tea-caddies, plates, dishes, bowls, candlesticks, mugs and bottles were made in great variety, and its base the ware is a dainty and elegant one, so that it was developed in the district, and, for the first time, a distinctively English pottery was exported to the continent and to the American colonies.

**English Earthenware.**—The manufacture of tin-enamedled pottery scarcely obtained a foothold in Staffordshire, but the invention of the white salt-glazed ware paved the way for one of the greatest revolutions in the potter's art that the world has ever seen. This was nothing less than the abandonment of the ordinary red or buff clays with a coating of white slip or of tin-enamed, and the substitution of a ware white throughout its substance, prepared by mixing selected white-burning clays and finely-ground flint (slica). The change has generally been associated with Wedgwood, most famous of English potters, but he really only perfected, along with his contemporaries, the Warburtons, Turners and others, the work of half a century's experiment and discovery. The ware compared most favourably, from the point of view of serviceableness, neatness and mechanical finish, with all that had gone before it, and as the tin-enamedled wares had almost everywhere in Europe sunk to the position of domestic crockery—for the Chinese, German, French and English porcelains had displaced them with the west—his better-brominated and more durable English ware gave it its final death-blow. English earthenware in its various forms was to be met with all over Europe, from London to Moscow, and from Cadiz to Stockholm; and, aided by emigrant English potters, the continental nations soon began a similar manufacture for themselves. Everywhere this great change was encouraged by the growing fondness for mechanical perfection, and it is not without a sight that a lover of pottery can witness the gradual disappearance of the painted tin-enamedled wares—degenerate survivals though they were of Italian majolica, French faience and Dutch "Delft"—before the unconquerable advance of another form of pottery which in its inception was based on technical rather than artistic qualities, especially as nearly a century passed before the new material was turned to artistic account.

By general consent the name of Josiah Wedgwood has been pre-eminently associated with this great change, and with good reason, for though he had many contemporaries who equalled or even excelled him in certain kinds of pottery, no other potter ever approached him in the range of his products and the varied applications to which he turned the exercise of his remarkable talents. True, he soon abandoned the simple Staffordshire wares, coloured with mottled glazes or clay-sips, to which the names of Astbury or Whieldon are commonly attached, but the varied productions of his factory united the best work of a distinct and varied kind of pottery, with something especial to Wedgwood himself. Thus the process he had improved the green and yellow glazes which had come down from medieval times (see the cauliflower ware piece, Plate X.), and gave a new direction to their use in his green-glazed dessert services, candlesticks, &c. He carried on the manufacture of hard-fired red-clay teapots, mugs, coffee-pots, cream-jugs, &c., introduced by Elers; and, along with his fellow-potters, he invented drab, grey, brown and other colours in similarly hard-fired unglazed bodies. He neither invented nor alone perfected the Staffordshire cream-coloured earthenware, but he made it so well that his "Queen's ware" was the best of its class. He undoubtedly invented the Jasper ware, in which on grounds of unglazed blue, green, black, &c., white figures and ornamental motives, adapted from the antique by Flaxman, Webber and other sculptors, were applied; and he even attempted to reproduce the painted vases of the Greek decadence in dry colours painted over a hard black body.

Wedgwood's "Jasper ware," his most original production (see Plate X.), differed both in nature and composition from all the species of pottery that had preceded it. In an attempt to obtain the qualities of the finest porcelain biscuit, Wedgwood discovered that the former could be made by mixing together a plastic white clay and "cawk" or barytes; he could obtain a "body" which might be "thrown" on the wheel or "pressed" in moulds, and which, while it fired to a white and sub-transparent pottery, was capable of being coloured, by the usual metallic oxides, to various shades of blue, green, yellow, lilac and black. The ware resembled "biscuit" porcelain in that, it needed no glaze to render it impervious to water, and it thus marked the culmination of those "dry" or unglazed wares that had been so largely made in China, Japan and Europe, where the quality resides in the fired clay material without any adventitious aid from a glaze. The general practice was to make the body of the vessel of a coloured material and to ornament this with applied figures or ornamental reliefs, in "white" of the same kind, "pressed" from intaglio moulds and then applied by wetting the surface and squeezing leaving the fire to unite the vessel and its applied ornament into one piece. Sometimes the ornament was in a coloured clay applied on a white body, and we get in the same way black on red, buff on red or black, and red or black on buff and drab bodies. The variety of bodies produced by Wedgwood and his followers in this way is exceedingly great, and it is only to be equalled by the diversity of their application, for the pieces made include plaques, vases, plates, dishes, jardinières, bulb-pots, teapots, cups and saucers, inkstands, scent-bottles, buttons, buckles, and, in a word, every kind of thing that could be made in clay. Many of the applied designs, whether of figures or ornament, were very beautiful in a way, being copied or adapted from Greek and Roman gems, vases, &c. At their best they are marvellous for the precision and delicacy of their execution, and it is impossible to imagine that anything better could have been done in this style. So perfectly did they represent the taste of their period that attempts were made at Sèvres, Meissen, Berlin and Buen Retiro to produce something of the same kind in porcelain; but none of these can be compared with the works of Wedgwood, or his great contemporary Turner (see Plate X.), in beauty of colour or perfection of workmanship.

It is obvious nowadays that much of this work was inspired by mistaken motives; that it was founded on an imperfect view of ancient art; and that it was marred by its mechanical ideals; but it must be remembered that it was in perfect harmony with the spirit of the age, and that in its time it was an artistic achievement of the highest order. It was a true"corruption of nature," for it was by the act of the artist rather than of nature that the original beauty of the subject was altered. It is amusing or annoying to find in European museums the wares of Wedgwood, Turner, Adams and one of the Leeds potteries, all lumped together as "Wedgwood," and yet one can hardly wonder at it, remembering how much has been written of Wedgwood and how little of the other English potters of the 18th century.

---

1 For a discussion of the stages through which this was achieved the reader is referred to special works, such as Prof. A. H. Church's *English Earthenware*, and W. Burton's *English Earthenware and Stoneware*.
CERAMICS

with the spirit of the times, and that while it emphasizes for us the pseudo-classic tastes of the late 18th century, it marks an advance in the technical skill of the potter, which is simply astounding. The co-ordination of labour, which had gone further with the Greek and the Italian potter than is generally supposed, was now brought to a climax. Mechanical appliances were introduced for the manufacture of many portions of the potter's work that had hitherto been indifferently performed by rude and exhausting manual toil; and while the application of mechanism was pushed too far—that in the first half of the 19th century we find the most inartistic pottery the world has ever seen—we must regard this even more as a cyclic movement of human feeling than as the work of any individual, or group of men. The late 18th century marks the period when pottery was no longer produced, as Italian majolica, the Henri-Deux ware, the Falissy wares, the best faience of Nevers, Rouen, Moustiers, Delft or Nuremberg had been, for the noble or the wealthy, but when it was largely in demand by the poorer classes, anxious in their turn to have a useful ware which should imitate the more costly porcelain used by the great. France, Germany, Sweden, Russia, and later the United States, all followed in the year, and the potteries of all were the same; and in all countries to produce elaborate engarved patterns in blue, brown, green, &c., in order to get an effect of the ware in harmony with the spirit of the times, and at the same time cheaper in price than the simple painted patterns of the vanished tin-enamel.

Collections.—The British and the Victoria and Albert Museums naturally contain the most representative collections of English pottery. The museums at Liverpool, Bristol, Burslem, Hanley and Nottingham also have good collections, while containing Manchester and Stoke-upon-Trent may be mentioned. The Guildhall Museum, London, is rich in early wares found or made in London and its vicinity. Continental collections of English pottery are meagre in the extreme north and dominated, even in the museums at Sévres and Limoges. The collection at Dresden is interesting, as it was purchased from the collection made by Enoch Wood, a Staffordshire potter. In America, the Boston Museum of Fine Arts, the Metropolitan Museum of New York, and the Pennsylvania Academy of Fine Arts at Philadephia contain interesting examples of wares exported to America in the late 18th and early 19th centuries.

LITERATURE.—The earliest compilations, such as Jewitt's "Ceramic Art in Great Britain" (1878), and "Life of Josiah Wedgwood" (1865); Chaffers, "Marks and Monograms" (1863; 9th edition revised, 1890); Metcalf's "Life of Wedgwood" (1865-1866); and Shaw's "History of the Staffordshire Pottery" (1899; reissued London, 1900), must always be of great value. Up to recently the best sources of information have been the later works, such as Church, "English Earthenware" (1884; new edition, 1906); Josiah Wedgwood (1894, reissue 1903 and 1907); Solon, "Art of the Old English Potter" (1883; 2nd ed., 1885); Hobson, "Catalogue of English Pottery in the British Museum" (1901); Burton, "English Earthenware and Stoneware" (1903), are the best authorities. (W. B. *).

CHINESE POTTERY AND PORCELAIN

In China, as in every country where pottery-making has been practiced for centuries, we find a natural progression from primitive pottery akin in shape, decoration, and manufacture to the pottery of other primitive races the world over. We find too the early use of bricks, tiles, &c., as in Egypt and Assyria; and then the usual succession of domestic utensils, funeral vases, and vessels for religious ceremonies. There is nothing to show that the potter's wheel made its appearance in China earlier than elsewhere, and the Chinese potters have used the simple methods of curving and "pressing" from moulds, which are used to a great extent, even more than other nations. In books of the Chow dynasty (1122-249 B.C.) the difference between the processes of "throwing" and of "pressing" from moulds is clearly described, and it is instructive to note that many early as well as late forms of Chinese pottery are remarkably like their works in bronze. In the same way there is no definite date to which we can refer the introduction of glazed pottery. The earliest specimens of glazed ware known are referred by the Chinese to the times of the Han dynasty (206 B.C. to A.D. 220), a date much later than that of the earliest glazed wares of Egypt and Assyria. Remembering the intercourse between China and the West, it is not impossible that the idea of coating a vessel of clay with a glaze was carried into China from Chaldaea or Assyria. In any case the Chinese developed the potter's art on their own lines, for we have ample evidence that from very early times they fired their pottery to a much higher temperature than was common in the west of Asia, and so discovered types of glaze and of pottery that remained for centuries a mystery elsewhere. The glazed wares of the Han dynasty already mentioned are quite unlike any contemporary pottery produced in Syria, Egypt or Europe, for the body of the ware is so hard that it can scarcely be scratched by a knife, and the dark-greenish glaze has become iridescent by age as though it contained oxide of lead. The easily-fired friable wares of Assyria, Egypt and Greece seem to have had no attraction for the Chinese, and the glazes on their hard-fired wares were naturally different from those already described. The Chinese appear to have been the first potters in the world to discover that at a sufficiently high temperature pottery can be glazed with powdered felspathic rock mixed with feldspar, but by the time this was done in China, the Chinese had been in Europe and the Near East making refractory clay which might burn red, drab or buff; but in this technique lay the germ of Chinese porcelain, the most advanced form of pottery the world has yet seen. It is necessary to consider the pottery that preceded porcelain, for not only was it the matrix out of which porcelain grew, but in certain districts of China, where the necessary materials for porcelain are not found, similar wares have been manufactured without imitation to the present time. Naturally, in progress of time, the technique of this pottery has been greatly improved, both by developments in the preparation and mixture of the clays, the shaping and modelling of the wares, the introduction of coloured enamels or glazes, and the like. Dr Bushell, who is our great authority on the Chinese arts and handicrafts, rightly seizes on two outstanding types of Chinese pottery other than porcelain which have exercised considerable influence on the doings of European potters.

1. Yi-Hsing-Yao.—This is the pottery, generally of unglazed fawn, red or brown stoneware, made at Yi-Hsing-hsien in the province of Kiang-su. Articles of every kind are made, including highly-coloured clays, but the general forms are dainty and skilfully finished pieces, such as small teapots, cups, saucers, dishes, trays, water-bottles and wine cups. This ware was largely manufactured under orders from the imperial court by the famous potter, Bottger, and it was imported into Europe by the Portuguese, who applied to it the name baccaro, formerly given only to a scented terra-cotta brought from Mexico and Peru. This pottery and Chinese porcelain were wide asunder in the modes in nature as well as in art. Even when the English, who had come to China, realized that Europe regarded every kind of pottery coming from the Far East as a species of porcelain, and the manufacture of red teapots, mugs, bowls, cups, &c., in imitation of the Yi-Hsing-Yao was widespread during the late 17th and early 18th centuries under the name of red porcelain. Dwight, Elers and Böttger are notable names in this connexion.

2. Kuang-Yao.—The name given by the Chinese to the pottery manufactured in the province of Kiang-su. There are several centres of manufacture in this extensive province, but for the purposes of this article it is sufficient to state that the best-known of these wares are dense, hard-fired and glazed stonewares, which are always dark-grey, red, brown or blackish. They are usually glazed with thick, variegated or opalescent glazes, grey, blue, green, yellow or red, but flecked, veined and streaked with other tints. The wares are so like the productions of the Sung dynasty (A.D. 960-1279) that modern pieces of either kind are not always distinguishable. They are usually dated round the middle of the 13th century and are thus the most exquisite of all wares, for the manufacture of porcelain was at its highest in King-tê-chên, the potters in other parts of China carried on the production of glazed or unglazed pottery in coloured clays, and, further, the directors of the imperial court from time to time reproduce the most archaic wares that could be found in the Empire.

* Yao is the Chinese term equivalent of the English "pottery" or "ware."

Porcelain.—By this word we distinguish broadly all those pieces of pottery in which the body of the ware is vitrified and translucent, and also, broadly speaking, in which the material is white throughout, though minute quantities of metallic oxides have been definitely added to colour it. It is impossible to draw any hard and fast line between porcelain and stoneware, for both may be thoroughly vitrified and translucent in thin pieces—but generally the stonewares are dark, red or brown in the colour of the fired clay, and they seldom exhibit the precious quality of translucence. If the body of a piece of pottery is not even vitrified, however hard it may be, it is terra-cotta or earthenware. The Chinese, accustomed from a very early period to fire their pottery to a high temperature, produced vitrified stonewares before any other nation. Moreover, they glazed these stonewares with fusible mineral substances, and from that stage the natural refinements of methods must necessarily have produced porcelain. In regions where beds of primary clay were found, the body of the ware would burn whiter than elsewhere, and a mixture of limestone or marble with the felspathic rock would give a glaze of greater purity and brilliance and one that was more readily fusible and would spread better over the whole piece. How many centuries were needed before a ware was made enough translucent to be now classed as porcelain we cannot know; but the process was certainly one of gradual evolution. Some Chinese writers in their zeal for ancient things have ascribed to remote periods the production of wares of this class. Where authentic specimens are not to be found it is necessary to proceed with caution, and literary evidence alone cannot be deemed sufficient to settle such a difficult point. The balance of opinion at the present time is that something worthy of the name of porcelain was made during the Tang dynasty (A.D. 618–907), but we have no pieces earlier than the Sung dynasty (A.D. 960–1259), and the appearance of these is perhaps more fitly described as stoneware than as porcelain.

Under the Sung dynasty China enjoyed great material prosperity, and all the arts were cultivated assiduously. Pottery of distinguished merit was made in many districts, and much of it has been classified as porcelain because the body is whitish and vitrified, though it is much inferior in finish and in translucence to the perfect white porcelain of later times. It is necessary to realize, too, that we have no record of any pottery with painted decoration until a little over a century later than the 13th century. The glaze of the early Sung period consists entirely of a pure white body, or of a very faintly mottled or incised or modelled in the clay. But the principal decoration is to be found in the varied coloured glazes with which the wares, whether stoneware or porcelain, were covered. The glaze is never clear and white as at later times; it is generally uneven, imperfectly fused and presents all the marks of an imperfect technique. The nearest approach to white is found in an opalescent grey which shades off to greenish and bluish tints. The glazes of this period which are most highly valued are the cèladons, a family of cool bluish or yellowish greens of indescribable depth and softness. Besides the cèladons which are the most uniform in tints of the Sung glazes, we get many shades of pale lavender, brownish yellow and brownish black; but these are all subtly or boldly mottled, splashed, clouded or veined with strange tinges of red, blue, purple, opalescent grey and black. The most famous of these now very rare Sung wares were the stonewares of Chün-chow, remarkable for their rich and varied glazes, the black variegated glazed wares of Fu-kien province, “hare’s fur” cups and “partridge cups” of collectors, and the four principal wares usually called as was used the jü-yê of the Sung dynasty, the Kuan-yê of Honan, the Kuan-yê of Kwan (= official” or “Imperial”), made first at Pien-chow and afterwards at Hang-chow; the Ko-yê, made at Li-tien; and the Ting-yê, made at Tung-chow in Chih-li.

This was the period when Chinese porcelain became known beyond its native country, for the first mention of porcelain outside China appears in the writings of a Mahomedan traveller, Sulaiman, who visited China in the 9th century and wrote: “They have in China a very fine clay with which they make vases which are as transparent as glass; water is seen through them”1,2 and its first appearance in the west is always given as A.D. 1126 (or 1138), when Saladin sent a present of forty pieces to the sultan of Damascus. From this time onwards an export trade was developed, particularly in the cèladon wares of Lung-chuan, a city in the south-west of the province of Chekiang. This famous ware, the “green porcelain” of the Chinese, probably made as an imitation of jade, exists mostly in the form of thick heavy dishes, bowls and jars, bearing incised or fluted patterns, and coated with a remarkable thick green glaze of indescribable softness of tone. Though the body of the ware is white when it is broken through, any parts not covered by the glaze have a reddish-brown colour due to the unfired paste, and when the ware was reproduced in later times this reddish-brown tint had to be imitated artificially. The ware was highly prized both in China and Japan, in the islands of the East Indies, and in all Mahomedan countries. In Persia it was largely used, and specimens of it have been recovered during the last century from the east coast of Africa and as far west as Morocco.

1 M. Reinand, Relation des voyages faits par les Arabes et par les Persans dans l’Inde et la Chine dans le IXe siècle (Paris, 1845).

2 The suggestion has been made that the cèladon wares found in Western countries were made by Moslem potters and not by the Chinese, but this theory is not generally accepted. On this point consult Karabacek, “Zur muslimischen Keramik” in Österreichische Muntatschrift für den Orient, vol. x., 1884; A. B. Meyer, " Uber die Herkunft gewisser Seladon-Porzellan,” in " Über die Marta basis,” ibid., vol. xi., 1885; Hirth, Ancient Porcelain (1886), and Bushell, Oriental Ceramic Art (1899).
CERAMICS

The first examples of porcelain decorated with colours fired over the glaze. It seems probable that the practice grew out of the use of enamels on metal, which had spread from Byzantium to China, and which the Chinese developed with remarkable skill. It is important to remember that the very nature of the glaze of Chinese porcelain, necessitating such a high temperature to melt it, severely restricted the under-glaze palette to cobalt-blue and the glorious but uncertain copper-red. To obtain the rich polychromatic schemes of the potters of the West some other means must be found, and so the device was adopted of taking a finished piece of blue and white and decorating it further by very fusible colours painted over the fired glaze and then attached to it by refiring at a lower temperature equal only to that used by the enameller on metals. At first the on-glaze or enamel colours were applied as thin washes, as in the Ming (San ’st’ai) three-colour decoration of green, purple, and yellow. Then we get the Ming (Wan-li W u’st’ai) five-colour scheme, in which the same three colours are combined with an over-glaze red and all are painted over a skeleton pattern in under-glaze blue. This development, as its name implies, only took place in the reign of Wan-li (1573-1620).

At this time King-té-chén must have produced a very large quantity of porcelain. The requirements of the court were enormous, for in 1582 one of the supervising censors, reporting with the emperor, declared that one year’s demands comprised over 66,000 pieces; and Dr Bushell writes: “The colossal production of the reign of Wan-li is shown by the abundance of porcelain of this time to be found in Pekin at the present day, where a garden of any pretensions must have a large collection of bowls or cisterns for goldfish, and street-hawkers may be seen with sweetmeats urged by dishes a yard in diameter, or ladling syrup out of large bowls, and there is hardly a butcher’s shop without a cracked Wan-li jar standing on the counter to hold scraps of meat.”

Such profuse orders may be accountable for the fact that the wares of this reign are inferior both in material and workmanship to the wares of the preceding and also of later periods, but the influence of the growing export trade doubtless told in the same direction. For several centuries the native Chinese porcelain had been exported to all the neighbouring countries, and through Persia and Cairo to the West. No long time elapsed before the Chinese adopted forms, colours and decorations for these export wares, not in accordance with Chinese usage, but presumably more suited to the tastes of the foreigner. Hence the Egyptian and Syrian style of the painted blue decorations of the 15th and 16th century wares found in other Asiatic countries.

Now, for the first time, there came a direct European demand, and cargoes of ware were brought to Europe by the Portuguese and afterwards by the Dutch, which were increasingly decorated in fashions foreign to Chinese taste. The production of these export wares slowly modified the taste of the Chinese themselves and paved the way for the new styles of the late 17th and early 18th centuries.

The political troubles which marked the downfall of the Ming dynasty definitely separated the first great period of Chinese porcelain from its second and culminating period. The works at King-té-chén were destroyed more than once in the 17th century, but in spite of these difficulties the potters must have remained, for the reigns of K’ang-hi (1662-1722), Yung-chén (1722-1735), and K’ien-lung (1736-1795) covered a century and a half, within which the high-water mark of artistic production was reached and passed. It is only possible here to sketch in broadest outline the course of this Renaissance, which has formed the subject of many learned works.

It is characteristic of the Chinese mind that during this period, when a spirit of eager experiment was abroad, the productions of their ancient arts should receive no less attention than the new methods of decoration in on-glaze colours, while at the same time many of the discoveries of the later Ming days were carried on to perfection. The first remarkable productions of the reign of K’ang-hi, the famous green and blood-red Lung-yao glazes, were made in the attempt to produce glazes like those
of old times. With the more carefully prepared body and glaze the results are strikingly different and, as we think, superior, for it is difficult to believe that any example of the "sacrificial" red of the reign of Suen-te can have been as glorious as the red Lang-Yao, the crown of all that group of glazes known from their general colour as sang de bœuf (see example, Plate VII.). In the same way the traditional blue and white of the Ming period was continued with the greatest skill, and, if the blue pigment be not so pure as that of the 15th century, the decorative effect of the blue and white of the reign of K'ang-hi (see example, Plate VIII.) has never been equalled in Europe. The subjects of the blue and white pieces of this period are very varied, including religious, ceremonial, battle and hunting subjects, homely scenes such as ladies and children amusing themselves in gardens, or animals, birds, dragons and other fabulous monsters disposing themselves in clouds or waves. The so-called "hawthorn geyter jers" form a class by themselves in the opinion of modern collectors (see the plum-blossom jar, Plate VIII.), a specimen being sold at the Louis Huth sale (1906) for £3,000.

The fertility of the painters was remarkable, and a collection of the blue and white of this reign shows the variety of ceramic colour from the harmonious white being obtained in one piece, the powder-blue effect for CHINESE

During a time,

It is of interest to note that the "Delft," of Holland, also a product of the 17th and early 18th centuries, makes the nearest approach in quality to the blue and white porcelain of the Chinese. styles seem to have been finally struggling for mastery. Yung-Cheng was an ardent collector of ancient Chinese porcelains, and he sent to King-tè-chên specimens of the most ancient wares, whether of pottery or porcelain, to be reproduced, while at the same time he and his court patronized the wares in foreign styles and colours (Japanese and European.)

The struggle continued practically to the end of the 18th century, but in spite of certain brilliant inventions, such as the "iron- rust " and " tea-dust " glazes of the reign of Kien-lung in harmony with old Chinese effects, what we must regard as the inferior decorative style triumphed, and we see the gradual disappearance of the ancient methods in favour of (1) wares of a beautiful white body decorated only with on-glaze colours, principally those of the famille rose, and (2) a very large production of inferior wares, made in European shapes and decorated with on-glaze painting and gilding to suit the European taste of the 18th century.

This "armorial" china, so much of which was once foolishly ascribed to Lowestoft, has little to commend it. The material is seldom of the best quality, and the Chinese rendering of European figures and designs is often so bad as to recommend it. A great deal of this ware, though manufactured at King-tè-chên, was decorated at Canton, and the school of pottery decorators founded there by reason of this export trade also produced a certain number of pieces in pure Chinese taste, especially some of the rose-backed plates and dishes and the small cups and saucers decorated with deftly-painted designs of cocks, peonies, &c.

It must be pointed out that the great change implied in the replacement of patterns painted in blue under the glaze by those painted in colours over the glaze profoundly influenced the style of painting. In the earlier wares the treatment is bold and vigorous as becomes true pottery colour, and the softening of the colour by the melting glaze adds to the artistic charm of the result. Painting on a fired glaze is like painting on glass—fine lines, delicate drawing, and skilful stippling or cross-hatching are just as natural in this method as they are undesirable or uncertain in the other. Naturalism of rendering takes the place of conventional decorative treatment, and elaborate minuteness of finish supplants the broad brushwork of direct brushwork. During the 18th century the same leaven was at work on the porcelains of China and of Europe, the East influenced the West, and the West in its turn bore down the East. If Chinese porcelain remained superior to its European counterparts, it was because the Chinese was still the better potter and had a longer tradition of decorative art behind him.

There is little to be said of Chinese porcelain during the 19th century. The European demand was practically killed by the growth of porcelain works at home, and the imperial patronage, so great a factor in the production of artistic wares, was fitful and uncertain. Tao-Kwang (1821-1850) gave some attention to porcelain, and the pieces made for him and marked "Shen-te-lang" are valued by collectors. The so-called Peking bowls of his reign (made of course at King-tè-chên) are also of repute. But political difficulties of China left little leisure for the cultivation of the arts; the successive wars with France and England served only to scatter the splendid wares of the past (see the Musée Chinose at Fontainebleau), and during the reign of the next emperor Hien-fêng (1851-1861) the Taiping rebels overran the province of Kiang-sî and destroyed King-tè-chên and its factories. Since then the town has been rebuilt and is once again producing Chinese porcelain. Tempted doubtless by the high prices now paid in Europe and America for examples of Chinese porcelains of the 18th century, modern copies of the single-coloured, sang de bœuf, flambe and other glazes are being made, while the highly prized "hawthorn" jars and black-ground vessels are receiving the same undesirable attention.

Materials and Manufacture of Chinese Porcelain.—For many centuries after its first appearance Chinese porcelain differed from every other known species of pottery both in its material and its manufacture. While the pottery of all other countries was generally

Paragraph: The manufacture lay in the discovery of large masses of primary clay (kaolin) mixed with finely-ground felspathic rock (petuntse), both of which were carefully washed, levigated and purified. The body of Chinese porcelain was derived from the materials, the natural clay and the felspathic petuntse, were selected and mixed with lime—being ground to fine powder. The lime causes the glaze to melt at a lower temperature than would be necessary for petuntse alone. The lime also gives the Chinese glazes their luscious softness of aspect and the faint greenish or bluish tints which enabled them to receive the later decorations in piled-up enamels, impossible on the harder European porcelain.

The earliest Chinese porcelains were made for the Chinese market, but then the European potters copied them and, like them, evolved their own use of the use of glass. Efforts were made at Plymouth and at Bristol (1758–1761) to introduce the manufacture of porcelain, like the Chinese and its German counterparts, but these failed and the English potters finally invented a third kind of porcelain, in which calcined ox-bones were added to the clay and ground rock to give a white translucent porcelain capable of receiving any form of decoration. This distinctively English porcelain, perfected about 1800, is not only the principal kind made in England in our own times, but its manufacture has been adopted, to some extent in France, Germany, Sweden and as well as the United States.

It is impossible to describe these various efforts of European potters without a certain amount of overlapping, for during the 18th century all the three kinds of European porcelain were struggling for supremacy. It is advisable, therefore, to keep clearly in mind which kind of porcelain is in question, for many problems of manufacture and decoration are absolutely determined by the nature of the materials.

If we could trust to documentary evidence alone, the earliest European porcelains were made at Venice in 1470, and again in 1519; while we also read of its manufacture at Ferrara in 1561. Unfortunately, documentary evidence alone is not conclusive, and the first European porcelain, known from actual specimens and as well as by documentary evidence, was that made at Florence in the laboratory of Francesco de’ Medici, between 1575 and 1585. Specimens of this rare porcelain are to be found only in great museums and private collections, where they rank among our chief ceramic treasures.

They show clearly that the Florentine potters never fully mastered their difficult material, for the ware is always imperfect and compares indifferently in whiteness and translucency with fine porcelain, while the glaze is neither smoothly melted nor free from defects. Obviously the effect of Chinese blue and white porcelain was aimed at, the decorations, reminiscent of the style of the Persian potteurs, being blue alone.

These rare and interesting pieces bear distinctive marks; for at their period the use of painters’ marks or monograms had become fairly general on artistic pottery in Europe. One of the best known marks is the “palle” or balls of the arms of the Medici family, bearing the letters “F M E D II.” for “Francisco Medici Magnus Etruriae Dux II.”; while other pieces have a rude representation of the Great Dome of Florence Potter’s mark, and the letter “F.”

Fortunately, too, besides the few specimens of Florentine porcelain that have survived to our day a manuscript has been

found in the Magliabechian Library at Florence which states that the paste was composed of 24 parts of sand, 16 of a glass (powdered rock crystal and soda), and 12 parts white earth of Faenza. To 12 parts of this mixture 3 parts of the kaolinic clay of Vicenza were to be added, and the pieces glazed with a lead glaze, or sometimes with the tin-enamel of the Italian faience maker. We are in the presence, therefore, of a material unlike Chinese porcelain in every respect, the Florentine porcelain being the first of a long line of European porcelains the artistic qualities of which were obtained by mixing a large quantity of glass with a small quantity of clay, so that they may almost be regarded as a species of glazed and painted glass. The technical methods used in their manufacture and decoration, however, were those of the potter and not of the glass maker.

With the death of Francesco de' Medici in 1587 it seems probable that this wonderful invention came to an untimely end, and we hear no more of porcelain in Italy for more than a century. During this century (1587-1687) there can be no doubt that efforts were made to discover the secret of porcelain manufacture; but the first reliable date we can point to is 1673, when Louis Poterat, a faience maker of Rouen, obtained a privilege from the French king for the manufacture of porcelain in that town. The Rouen porcelain in turn ceased with the death of Poterat in 1696. Authentic specimens are extant in the shape of salt-cellars, mustard pots and some few vases, the latter of considerable size. The pieces are usually decorated in blue with patterns in the Rouen style and were evidently painted by an expert faience painter. In composition, the porcelain of Rouen, like that of Florence, was of the artificial or glassy type, and shortly afterwards a similar ware made its appearance at the faience works of St Cloud near Paris, and at various works in the city of Paris. Well-known pieces, bearing the marks here shown, formerly supposed to be the earliest specimens of French porcelain and the work of Poterat at Rouen, are probably experimental pieces made in Paris after the date of Poterat’s discovery, as they differ in important particulars from his ware.

Once firmly established in France, this manufacture, under the patronage of the French court or of some great French noble, rapidly assumed a position of importance. The works at St Cloud received letters-patent from Louis XIV. in 1696, and the manufacture was continued there down to 1773. The appearance of the St Cloud porcelain is very characteristic, for though the paste has a yellowish tinge it is of fine quality with a clear and brilliant glaze. The first efforts appear to have consisted in frank imitations of the much-prized Oriental wares, and white pieces decorated only with branches of flowering plum in relief, or pieces modelled with imbricated or scale pattern or with delicate flutings, were made. The earliest colour decoration was naturally in under-glaze blue, and while quasi-oriental designs were largely used, the commonest feature is the prevalence of painted borders like those used on the faience of Rouen and St Cloud. At a later date decoration in over-glaze colours and gliding was also employed, and though the ware never reached to such a pitch of excellence as that of the Royal Manufactory at Sévres, the St Cloud porcelain is one of the most distinctive French porcelains of the 18th century.

German Porcelains.—While the glassy porcelains of France were being developed at St Cloud, success of a more permanent order was reached in Germany. Augustus the Strong, elector of Saxony (1670-1733), had formed an extensive collection of Chinese and Japanese porcelains, still to be seen in the Dresden Museum, and he had established experimental pottery works, bringing skilled potters from Holland and elsewhere. His chief investigators appear to have been Tschirnhaus and Böttger, both alchemists, and it was the glory of the latter to be the first European to produce a porcelain like the Chinese, both in the nature of its materials, and in the appearance of its paste and glaze. It may be surmised that Böttger was guided toward this momentous discovery by information brought from China, though such an idea is always stoutly denied by German authorities, who, with pardonable pride, claim that Böttger at the age of twenty-four succeeded where all other European experimenters had failed. He was certainly working at the problems offered by the exotic wares of China, for his first production was an extremely hard redstone-ware—often erroneously called "Böttger’s red porcelain"—resembling the Chinese "bocaros" or red teapots of the Yi-hsing potteries. He had been anticipated in this direction by Dwight of Fulham, but the red pottery of Böttger was so intensely fired that it became dense enough to be cut and polished by the lapidary as if it were a piece of jasper or carnelian. It was first offered for sale at the Leipzig fair of 1710, and for many years it enjoyed great popularity, as well as the undesirable honour of wide imitation. At the same time (1710) Böttger exhibited a few crude specimens of white porcelain. Imperfect pieces were on sale in 1713, and by 1716 its manufacture was definitely established, though the pieces were still far from perfect. Böttger died in 1719, having had the rare fortune, in his short and eventful life, to establish in Europe the manufacture of true porcelain.

The life of Böttger reads like a page of romance, and the story of the subsequent development of porcelain manufacture throughout the German empire is hardly less romantic. While the importance of Böttger’s discovery was recognized, he and his workmen were removed from Dresden to the Albrechtsburg, a fortress situated at Meissen some 16 m. away, so that the manufacture could be conducted with the greatest secrecy. All concerned were practically state prisoners, and this extreme rigour doubtless defeated the end in view, for workmen escaped from time to time, and professing, more or less truthfully, a knowledge of the manufacture, found patrons among the German princes all eager to gain reputation as experimenters in the new art of porcelain. Some of these wandering "Arcanists," like Ringler and Hunger, and the men who learnt from them, travelled all over the empire, and the following list of dates will show how porcelain factories sprang up from the parent factory at Meissen:

Meissen.—Although the factory which was founded at Meissen as a result of Böttger’s discovery remained on its old site until 1833, the porcelain made there has been commonly known as Dresden porcelain; probably because Dresden was the seat of the Saxon court, and the enterprise was conducted at the expense of the electors of Saxony. So jealously were the secrets of this factory guarded that when Napoleon, the master of Europe, sent Bronngrat to investigate the methods in use at Meissen in 1812, the elector of Saxony had to release Steinauer, the glazier, from his oath of secrecy before he would explain the processes. Meissen porcelain therefore, affords us the best example by which we may follow the changes of fashion and taste that governed the styles of porcelain decoration in Europe during the 18th century. The early Meissen porcelain was made from the kaolin found at Aue, near Schneeberg, and while there is no mention of any other material, we may be sure that clay and felspathic rock, analogous to the Chinese kau-lin and pet-ten-se, were obtained from the same quarries, and were used together. Until after the death of Böttger in 1719 it cannot be said that the venture was more than a succès d’estime. The specimens preserved in the Dresden Museum show that the pieces were generally thick in substance and clumsy in shape, being often mafe from the moulds that had been designed for Böttger’s red-stoneware. Naturally enough these early examples were inspired by Chinese models, both in shape and decoration. As at St Cloud, white pieces with modelled decoration were common. Unlike the contemporary French glassy porcelains, the decorations in under-glaze blue were very imperfect, the
blue colour being much run and blistered; and when attempts were made at decoration in enamel colours (i.e. colours fired on the finished glaze) the result was unsatisfactory, as, owing to the refractory nature of the hard felspathic material, these colours frequently scaled off. The later success of the Meissen factory must be attributed to Herold or Hördlt (who joined the staff in 1720 as a colour maker and painter), and to Kandler, a sculptor, who came to the works in 1731. In the hands of these two men the forms and decorations, still largely based on Chinese and Japanese models, assumed a definitely European style, while the composition of the body and the glaze, and the application of colours and gold, were brought to perfection. Herold was appointed director of the works a few years after 1720, and retained that post until 1765, while Kandler was chief modeller from 1731 to 1775. The years from 1730 (when the work definitely emerged from its experimental stage) to 1775 (when Kandler died) mark the most distinctive period of the Meissen porcelain. In the estimation of collectors also the Meissen porcelain of this period is the most valuable, and genuine examples of All-Meissen command high prices in the sale rooms, especially in Germany. This appreciation was quite as apparent in the 18th century, for by 1740 Meissen porcelain had won the greatest renown in Europe, and was actually exported by way of Constantinople over the Mahomedan countries of the Near East. It is frequently described by contemporary writers as being far superior to the porcelain of China, and so great was its vogue between 1740 and 1750 that as many as 700 workmen—a large number for those days—were employed, and the industry brought large profits as well as great reputation to the Saxon court. Each year saw some fresh departure from the original inspiration of the work, some fresh innovation of European style in design. After 1730 the rude reproductions of Chinese forms and decorations in white or blue and white were replaced by imitations of the Imari porcelain, especially those produced in the style of Kakiemon. Here Meissen was running a race with Chantilly in setting the fashion for the dainty decorations in red and green and gold which spread in time to all the porcelain factories of Europe. Gradually European motifs became predominant. The simple oriental forms were replaced by distinctively European shapes with architectural mouldings, handles and feet. Instead of the dainty Japanese patterns, we perceive the gradual introduction of Rococo scroll-work (as interpreted by the Germans) to form a framework or border for miniature-like paintings of landscapes, ruins, figure-subjects, hunting scenes, &c., executed in the limited palette of on-glaze colours then available. Further evidence of the departure from oriental influence is to be found in the numerous armorial services produced between 1730 and 1745; and at the same period we find the first appearance of a style of decoration that has persisted to our own times, as a means of passing off pieces with small flaws in body or glaze, by hiding them among sprays of naturalistic flowers, with an occasional fly or some other winged creature thrown with seeming artlessness over the surface of the piece. This idea, though it seems to have been first used at Meissen, was so useful to the potter that it became general, and a device originally adopted to cover faults of manufacture was elevated into a distinct style of decoration by later European factories (e.g. Strassburg, Niederviller, &c.).

The talents of Kandler were applied in ambitious but unsatisfactory attempts to produce life-sized figures of the twelve apostles, an equestrian statue of Augustus the Strong of heroic proportions, and many models of animals intended for the decoration of the Japanese palace at Dresden. Many of these latter are to be seen in the Dresden Museum, and create an unfavourable impression of the taste of their period. The fame of Kandler is better perpetuated (see example, Plate IX.) by the little statuettes and groups of figures and animals that flourished in a steady stream from his facile hand; for though these figures have prettiness rather than grace, and flair rather than style, they are instinct with the spirit of the middle 18th century, and were eagerly imitated or boldly copied at every factory in Europe. Only in the biscuit porcelain figures of Sévres, and in some few of the portrait figures of Derby, do we find anything artistically superior. These Meissen statuettes look their best when they are simply in white; many are grotesque and ugly, and the colour decorations are usually in very poor taste, the harsh, shining colours contrasting unpleasantly with the pronounced white of the porcelain.

Mention must be made of the use of modelled flowers at Meissen. Originating in the simple application of modelled branches of prunus, &c. in imitation of the white porcelains of Fuji, the method developed until we get not only the characteristic May-flower decoration (see example, Plate IX.), but also independent sprays and bouquets modelled in porcelain and coloured with the utmost mechanical precision. It is not quite clear whether this production of porcelain flowers was first perfected at Meissen or at Vincennes, but it was largely practised at both places. Toward the end of this period, vases, candleabra, mirror-frames and clock cases were modelled in the most outlandish rococo forms with applied scrolls, shells and flowers. These pieces had their modelled details picked out in gold and colours, while the success of the French styles of decoration is still further shown by the copies of Watteau figures and groups on the more important vases, dishes and plates. Frederick the Great made sad havoc with the prosperity of Meissen during the Seven Years' War. He looted the factory both in 1759 and 1761, and is said on the latter occasion to have carried away to Berlin both models, working moulds and many workmen. This misfortune marks the end of the most distinctive Meissen porcelain, for after this time Sévres became the most important porcelain factory in Europe, and the later productions of Meissen were, for the most part, German versions of the styles initiated at the French royal factory. From 1764 to 1774 Dietrich, a painter, was at the head of affairs, while a Frenchman named Acier succeeded Kandler. The latter introduced the neo-classical style, which was spreading like a blight all over Europe, and this departure was followed by the directorship of Count Marcolini (1774-1814), when Meissen, fallen from its high estate, was content to follow the lead of Sévres. After the Marcolini period there is nothing to be said of Meissen. The old productions of the factory had become valuable, and the custom of reproducing them, marks included, was adopted. Such a practice was not likely to lead to further progress, and, though the factory was removed from its old site in the Albrechtsburg in 1863, it cannot be said to have added anything to the progress of European porcelain during the 19th century.

During the initiatory period the Dresden pieces bore the monogram "A. R." interlaced (Augustus Rex), and between 1712 and 1716 pieces intended for sale and not for the use of the court were marked with the sign of Aesculapius (a snake twining round a staff). From about 1720 two crossed swords, painted in blue under the glaze, with or without accompanying stars, crosses, &c., formed the general mark, but the mark has been so often used on other porcelains that, in itself, it is of slight value as a means of identification.

Vienna.—The first mention of the manufacture of porcelain in Vienna occurs in 1718, when a Dutchman, Claude du Pauquier, was granted a patent. He had secured two runaways from Meissen, Stölzel and Hunger, yet little progress was made until after 1744, when the factory was bought by the empress Maria Theresa. At first the traditional styles of Meissen were continued, but the characteristic Viennese porcelain was produced after 1785. In this ware figure-painting, rich ground colours and elaborate gilding are associated in an unmistakeable manner. Leitner, who was chemist and colour maker at this period, succeeded in producing a more extensive and brilliant palette of colours than was in use at any other European porcelain factory in the last quarter of the 18th century; and the gilding
was rich and elaborate. Apart from its technical merits the ware has nothing to recommend it, for the styles of decoration showed pronounced neo-classical influence, and lacked the saving merits of the French work in the same style. The works was closed in 1864, on account of the heavy expenses, and collectors should be reminded that many spurious imitations, the product of small Viennese factories, are to be found on the market.

**Berlin.**—The first Berlin porcelain was produced by W. Casper Wegeli, aided by workmen from other German factories, as early as 1750. This business was unsuccessful and came to an end in 1757, but its productions are highly prized on account of their rarity. Success only came when Frederick the Great brought workmen, moulds and materials from Meissen in 1761, and, becoming proprietor of the works in 1763, founded the Royal Berlin Porcelain Manufactory. Though Meissen workmen and methods had been imported, and the Meissen style governed the earliest productions, Frederick's well-known porcelain French art was doubtless responsible for the fact that the rococo style of decoration was more exclusively followed here than elsewhere in Germany. The colour schemes of this ware are unusually simple, pieces being seldom decorated in more than three colours, while a rose-coloured enamel, a favourite colour with the great Frederick, is quite characteristic. The Royal Berlin Factory passed under a cloud in the troubled condition of the Prussian monarchy during the early years of the 19th century, and down to 1870 it was content to follow in the wake of Sévres like most of the other European factories. Since about the year 1880, however, it has developed into one of the most important European porcelain works, and it was here that Klenze manufactured his special porcelain, made to reproduce the qualities of the finest Japanese wares. In spite of this scientific success it must be remarked that the late Berlin porcelain is artistically disappointing, being too exuberant for our taste and recalling anything rather than porcelain in its treatment.

**Minor German Factories.**—It is unnecessary to describe the productions of all the German porcelain works of the 18th century, for not one of the factories was family owned, but all the works aimed at producing pieces comparable with those of Meissen, Vienna or Berlin. In several instances the industry was established under the patronage of court officials or nobility, anxious to emulate the productions of Sévres, the Court of Vienna having been founded some fifty years ago, and the enterprise came to an end with the death of a patron or from his unwillingness to sustain the continued drainings upon his purse.

The factory at Höchst was started about 1750 by wardeens from Meissen, but it was only carried to a successful issue through the patronage of the archbishop-elector of Mainz after 1746. The general style of Höchst is a pallid imitation of the contemporary styles of Meissen, but an industry was noted for its excellent figures and groups, especially those modelled by Melchior (1770-1870). He modelled, at Höchst, more than three hundred figures, as well as many portrait medallions. The works came to an untimely end during the French Revolution.

Frankenthal had a porcelain factory (founded by the Hennfons of Strassburg) in 1756, and was patronized by Karl Theodor, elector palatine from 1762 to 1775, when the French invasion put an end to the industry. Another, the sculptor, came here from Höchst about 1780, and elaborate pieces in the oriental styles of Sévres and Dresden were made.

Nymphenburg, near Munich, had a factory which was made a royal factory in 1768, by Joseph III. of Bavaria. The one characteristic that distinguishes the productions of this factory from all others is the great care bestowed on the figures, and the gold and silver gilding. The general style is that of Sévres, but with a marked peculiarity, which is that of Herend, which was founded about 1850 by Moritz Fischer, and that factory copies of oriental porcelain were made that have deceived many collectors, though the pieces are usually impressed with the word "Herend." In the past another.

**Switzerland.**—Little porcelain has been produced in Switzerland, and considering the geographical position of the country it is curious that none was made there. The porcelain of the factory was entirely of oriental character, and another by A. Poppoff. Besides producing ordinary table ware these Moscow factories sent forth a considerable number of statuettes, the most interesting being those representing Russian peasant types. The one peculiarity which distinguishes these productions is that of Herend, which was founded about 1850 by Moritz Fischer, and that factory copies of oriental porcelain were made that have deceived many collectors, though the pieces are usually impressed with the word "Herend." In the past another.
The next important factory after St Cloud was that founded at Chantilly about 1725 under the patronage of the Prince de Conde, an enthusiastic collector of Chinese and Japanese porcelains. One distinctive feature of the Chantilly porcelain is its imitation of the Japanese Imari wares of the 17th century, especially those bearing delicate patterns in the Kakiemon style. This imitation was not confined to the decoration alone, but great efforts were made to reproduce the delicious tender whiteness of the original ware, by covering the body of the soft porcelain with a coating of the tin-enamel used by the French faience makers. Similar imitation of the Kakiemon style of decoration became the rage all over Europe, and was largely followed at Meissen and in England as well as in France; but no European imitations equalled those of the famous Chantilly ware.

Other porcelain factories were started at Mennecci-Villeroy and at Lille, but the most important French factory was that founded at Vincennes about 1740, not only because of the many beautiful pieces produced there, but also because the works was taken under the direct patronage of the king in 1753 and was transferred to Sèvres in 1756, becoming ultimately the most important porcelain factory in Europe.

Fortunately we have documentary information of the exact composition of the artificial porcelain (pâte tendre) of Sèvres, and a brief account of its manufacture will serve to explain how all the glazed porcelains of Europe were made. The potter commenced by preparing a glass or frit, melting together pure sand, alum, sea-salt, gypsum, soda and nitre. The clear portions of this frit were powdered and washed in boiling water, and the working clay was compounded by adding to this powdered frit a small quantity of chalky clay or marl and sometimes pure chalk as well. This mixture was ground until the fluid was as fine as cream, and it was then boiled to a thick paste which, when allowed to solidify itself, was then shaped. After the first drying, the frit and the plastic were added to give it enough plasticity for the workman to shape it. Vases and other pieces were made from this paste by pressing cakes of it in plaster moulds of considerable thickness. After pressing, the pieces were dried and then fired in a furnace. When the porcelain was drawn from the oven after the first firing, the supports were removed and the pieces were run, or turned, on sand to clean the surface, and were then coated with gilding by spraying with a brush; the gilding being a fusible glass very rich in lead. The gilding was melted by rubbing at the piecer at a lower temperature, and it was frequently necessary to repeat this process several times in order to get a perfectly even and brilliant result. The difficulties of such a process were enormous, and it was only by the financial support of wealthy patrons, or of the state, that such a method of manufacture was ever carried on for any length of time. At its best, the material was exceedingly delicate, especially for decoration in on-glaze colours, and the pieces produced at Vincennes and at Sèvres, between 1745 and 1770, or thereabouts, form a distinct class by themselves. Skilful chemists like Lellot and Macquer were employed to direct the operations, and many beautiful ground colours, such as the famous gros-bleu, bleu de roi, rose Pompadour, pea-green and apple-green were invented.

Sèvres Porcelains.—The forms of the Sèvres porcelain are exceedingly varied. Many of the older shapes were designed by Duplessis, the king's silversmith, and, as is perhaps natural, are more proper to metal than to pottery; but the French gilt porcelain is such an artificial material that every respect that such a point should not be strained too far. Owing to the want of plasticity in the paste the pieces were always made in moulds at the plaster of Paris, while in many cases they were moulded in separate parts and these united together with metal screws or mounted in bands of chased ormolu. Table services made for actual use were usually painted on a plain white ground with the full palette of on-glaze colours (or enamels) and much rich
gilding. The decorative pieces such as vases, candelabra, jardinières, &c., were decorated in a much more sumptuous fashion by covering the greater part of the piece with a ground of one of the rich enamel colours previously mentioned, reserving only panels in white on which delicate miniature-like decorations of the most varied kind were subsequently painted and fired (see fig. 52, and examples of Sèvres, Plate IX.). Such collections as the Wallace at Hertford House, or the Jones Bequest in the Victoria and Albert Museum, show at once the variety and perfections to which the work attained.

This Sèvres porcelain is entirely devoid of the broad decorative treatment and rich full of any of the great kinds of fine pottery or porcelain. Artistically considered, it has no place beside the triumphs of the Chinese or Persian potters; or of the Italian majolica. Its shapes are too formal, and are not sufficiently imbued with a sense of the qualities of the material. The ground colours defy every notion of the tendency of pottery colour for they are even, flawless and mechanical, with none of the palpitating richness that comes so naturally from the potter's processes. The paintings, whether of flowers, birds or figure-subjects, are extraordinarily skilful regarded as miniatures, but as examples of pottery decoration they cannot be compared to the swift, apparently careless, brushwork of the great masters of earlier times. So pronounced was the demand of the period for smooth even finish that such ground colours as gros-bleu and bleu de roi, where the colour naturally came varied and uneven, were subsequently decorated with small diamonds or lines of gold in the form of œil de perdix or vermicelle, so as to produce a more regular and even effect. The most elaborate and costly of all the varieties of old Sèvres is what is known as 'jewelled Sèvres,' which is richly sown with imitation jewels, such as turquoises, pearls, rubies, and closely resembling the real stones. These imitation jewels were in every case set in beautifully chased mountings of gold, and in the museum at Sèvres are to be found examples of the punches and other tools used in making these mounts. On account of the enormous expense involved in the production of such costly triumphs of skill, examples of jewelled Sèvres are rare even in the best collections, but the English student is fortunate in the fact that the Wallace collection contains a considerable number of them.

Many reasons—the prestige attaching to a Royal Manufactory, the knowledge that the porcelain was produced regardless of cost, the mechanical perfection of its colours, gilding and decoration, as well as the fact that the glassy porcelain was abandoned as too costly and risky after about 1780—have all conspired to raise the prices which modern collectors are prepared to pay for fine examples of Sèvres. It is doubtful whether the prices paid for paintings by old masters have advanced so rapidly as those paid for Sèvres porcelain of the best period. In the seventies of the 19th century it was deemed worthy of remark that a sum of £30,000 should have been paid at public auction for three old Sèvres vases; thirty years later one such piece would probably fetch the same price. It should be added that the extravagant prices now paid for Sèvres porcelain, which is much more a triumph of technical than of artistic skill, have led
CERAMICS

SEVRES, &c.]

Niederviller, Marseilles, Limoges and Caen. In the disastrous years of the French revolution (between 1789 and 1800), such of these factories as had survived came to an untimely end, even the royal factory at Sévres passing through a kind of lingering death between 1792 and 1797, and it was not until Napoleon decided to revive the glories of Sévres that modern French porcelain really came into being.

Just as the manufacture of German porcelain spread into Holland, Denmark, Sweden, Russia, &c., we find the manufacture of a glassy porcelain analogous to the early French arising in Belgium, Italy, Spain and England. The materials and methods were so like those used in France that it would be ridiculous to claim for them an independent origin, even were we unable to prove by documentary evidence that workmen trained in the French factories had migrated into those countries.

It was in Italy we find the earliest productions. Here near Bassano (1762-1825); Doccia near Florence (founded in 1735 by the marchese Carlo Ginori, and still carried on by the same family); and Capo-di-Monte near Naples (1736-1820); with minor factories like those at Montevetro, the Volpato factory at Rome. The most important of these were the factories at Doccia and Capo-di-Monte. The porcelain made at Doccia was famous for its soft translucent texture, so that it lent itself beautifully to the production of white glazed porcelain figures resembling in quality the white pieces of Fu-kien.

The factory at Capo-di-Monte was under the direct patronage of Charles III., king of Naples. The earliest and best of its productions were the bluish-white, probably painted in black, and though modelled in the form of natural shells supported by corals and seaweed. Figure-modelling was also largely practised, and besides groups of statuettes and figures in conjunction with vases, we have Capo-di-Monte Vases in which vases, cups, saucers, plates, &c., are covered with groups of figures modelled in high relief on a minute scale. This trivial style of work is greatly admired because of the minuteness of its execution. At a later period much more was removed from the vases and covered with flowers, and about 1770 the classic style was adopted for the shapes and decorations. The factory came to an end as late as 1820.

The factory at Sevres. — Charles III. of Naples ascended the throne of Spain in 1759, and took with him to Madrid many of the workmen from the Capo-di-Monte factory, as well as the best moulds and models. He established a new china factory in the gardens of Buen Retiro, a palace beside Madrid. As long as Charles III. lived immense sums were lavished on this factory, and the ware was not allowed to be sold, but was either used for the decoration of the royal palaces or for presentation to other European sovereigns. Enormous vases were made, following the example of Sévres, and these were often filled with bouquets of flowers modelled in porcelain. The most famous productions from this factory, however, were the plates and slabs of the Buen Retiro Potters’ marks, plate and slabs of which were used for lining the walls of certain rooms in the royal palaces. Two of these rooms still remain, and are frugal and examples of the Spanish rococo style. The factory was entirely destroyed in 1812 during the French war, and since that date no porcelain of any importance has been made in Spain.

English Porcelains of the 18th century.—There can be no doubt that whatever experimental work may have been conducted by our early English potters, such as the famous John Dwight of Fulham, nothing like an established manufacture of porcelain existed in this country prior to about 1740-1745. There are records of many tentative experiments before this date, but no real history. Between 1745 and 1755 important porcelain works were established at Chelsea, Bow, Worcester and Derby, and when we examine the productions of these factories it is impossible to avoid the conclusion that the processes had been imported from France. The early English porcelains, like all the French porcelains of that date, were composed of artificial or glassy mixtures.

We may take the early productions of Bow and Chelsea as typical of the earliest English porcelain of which there is any definite record. The material was a mixture of pipe-clay, sand from Alum Bay in the Isle of Wight, and glass, while the glaze was a fusible English flint-glass rich in lead. It is obvious, therefore, that we are dealing with substances very similar to those used in the glassy French porcelain (see above), and such mixtures were very difficult of fabrication, being subject to great loss in the process of fusing. In the other European countries
the manufacture of porcelain was almost invariably carried on at the expense of some royal or princely patron; and in England, however, the manufacture was not subsidized in this way, and it is probably for this reason that, at a very early date we find the English porcelain-makers experimenting with other materials than glass and clay in order to make their processes more certain.

In a patent taken out in 1749 by Thomas Frye of the Bow works we find mention of the use of bone-ash—the material that was to make English porcelain a distinct species by itself. From 1750 onwards there can be little doubt that, though a large proportion of glass was still used in the composition of the English porcelains, bone-ash was more and more introduced into the paste in order to obtain a more refractory material; yet it was not until about 1800 that Josiah Spode of Stoke-upon-Trent abandoned entirely the use of glass and composed his porcelain of china clay, bone-ash and felspathic rock for the body, glazing it with a rich lead glaze, and so laid the foundation of distinctively English porcelain. The material has many merits both from the useful and artistic points of view; it is much more easily fabricated than the old glassy porcelains, it endures better for ordinary table use than any other kind of porcelain, and it permits the fullest range of decoration.

Before entering upon a detailed notice of the important English factories of the 18th century, something should be said of the various influences that were at work in determining what the porcelain-maker should do, both in the way of shape and decoration. The eyes of all men were, of course, turned first to the porcelain brought from the far East; and in the early efforts of the English factories, as of those of France and Germany, we notice a predominance of white pieces or of pieces decorated with paintings in under-glaze blue alone, obviously inspired by the current importations from China. Bow and Chelsea produced large quantities of ware of this class, and in the early days of the Worcester factory little else was made than white, or blue and white pieces closely simulating the Chinese. Another origin of design was to be found in the Imari patterns of Japan, particularly those in the style of Kakiemon. It has been noted that Meissen, Chantilly and other continental factories had already created a vogue for these reproductions of Japanese decorations, and in our own country Bow, Chelsea and Worcester followed suit. The later Imari patterns, heavily decorated with blue and red and gold for the use of “the foreigner,” furnished another popular style for Worcester and Derby, and the vogue of these English “Japan” patterns, in the last quarter of the 18th century and the first half of the 19th century, was so great that they represent a large proportion of the output of our English porcelain works during that period. The productions of the German and French factories also exerted a profound influence on English potters; so that throughout the 18th century English porcelains largely consisted of imitations of the foreign wares brought into the country by the wealthy.

We can only point to a few methods of decoration which doubtless arose in England. This is the method of transfer-printing, whereby patterns printed on paper from engraved copper plates are transferred to porcelain or pottery and subsequently fired, either under or on the glaze. At the best these printed patterns are in no way superior to the stencilled work of modern oriental porcelain, while, at the worst, European and American printed patterns have been perhaps the most inappropriate decoration ever applied to porcelain in the world. It has been generally urged on behalf of transfer-printing that it enables elaborate effects to be produced at a small cost and so brings decorated pottery within the reach of the humbliest. The truer view is, that the simplest brushwork patterns, or even no pattern at all, would be preferable to the tawdry results that the cheapest forms of transfer-printing have rendered possible.

**Chelsea.**—Between 1750 and 1770 the Chelsea factory was the most important of all the English porcelain works, and fine specimens of this period command high prices in the saleroom to-day. We know little of the origin of this important factory, though it is believed to have been in existence from some time after 1740 to 1784, when it was finally demolished and some of the workmen and part of the plant were removed to the then important works at Derby. The first manager was one Charles Gouyn, who was followed by a Mr Sprimont before 1750. Sprimont retained possession of the works until 1760, and died in 1771. It was during his management, from 1750 to 1770, that the finest and most characteristic pieces of Chelsea porcelain were made.

Although the styles in vogue at Chelsea are extremely varied, little was produced there that was really English in character. The earliest pieces appear to have been either in pure white or in white decorated with paintings in under-glaze blue. The goat-and-bee cream jugs, crawfish salt cellars, the shell and rockwork salt cellars, jugs, sauce boats, small cups and saucers of this type are fairly plentiful. Then came the decorations, mainly in red and gold, of the Kakiemon style, followed by reproductions of the brocade patterns of Imari porcelain. Afterwards we find the appearance of table wares modelled in imitation of leaves, animals, fruits, birds and fishes, apparently adopted from current French and German practice.

In another direction the influence of Meissen was also shown by the production of statuettes (see in Chelsea figure, Plate X.), and of the small modelled trinkets, scent-bottles and toys of which there is such a fine collection in the British Museum. In the latter days of the factory (say after 1758) we find Chelsea following in the wake of Sévres in the production of large and elaborate rococo vases, with pierced necks and covers, scroll-work bases and interlacing handles such as are to be seen in the Jones Bequest in the Victoria and Albert Museum. Pieces of this elaborate kind are overlaid with rich grounds of Mazarine blue, turquoise, pea-green, or the famous Chelsea claret-colour, while white panels are reserved framed with gilt scrolls and painted in enamel colours with flowers, birds or figure-subjects in absolute rivalry with the pieces manufactured at Sévres.

The Chelsea works appears to have come to an end through the death of Sprimont in 1760-1770, and it was in 1770-1784 that Duesbury, the proprietor of the Derby works, carried on the establishment from 1770 to 1784, but in this period a great change is noticeable in the product of the factory. The “rococo” forms and decorations of the true Chelsea porcelain were replaced by works in the neo-classical style already rendered popular by the success of Josiah Wedgwood, and the Derby-Chelsea porcelain is quite a distinct production from the early works of Chelsea. The most distinctive mark of the Chelsea porcelain is an anchor—either embossed in the paste or painted in gold or colour. Often the anchors occur in pairs, and it is frequently associated with other marks such as a dagger or a cross. Some of the Derby-Chelsea pieces are marked with a conjoined D and an anchor.

**Bow.**—The date of the establishment of the factory at Stratford-le-Bow, in what is now the East End of London, is quite uncertain, but in 1744 Edward Heylyn and Thomas Frye, who were connected with this factory, took out a patent for the manufacture of porcelain. The materials mentioned in this patent are not such as would produce porcelain at all, and it appears likely that the specification was made purposely defective. In 1748 a further patent was applied for in which we get the first mention of bone-ash, so that from the technical point of view the wares made at the Bow factory are of the utmost importance as indicating the experimental beginnings of our English porcelain in which bone-ash plays such an important part. In 1750 the works at Bow belonged to Messrs Weatherby & Crowther, and was then known as “New Canton,” and as 300 workpeople were employed, the operations must have been conducted on a large scale; but ultimately, from causes that can only be surmised, the partnership was dissolved and the business failed, so that in 1775 the works was bought for a very small sum by the William Duesbury already mentioned, who transferred part of the plant and moulds to his more prosperous works at Derby. It would appear from what we know of the factory and its
productions that the business was conducted on simpler lines than at the Chelsea works. We have, for instance, no elaborate vases in imitation of Sévres, and no important groups of figures which might challenge rivalry with Meissen. We find, as is common with all the early porcelain factories of Europe, first the production of white pieces with modelled reliefs, or of pieces painted with under-glaze blue in imitation of Chinese porcelain. Then followed the well-known “Quail,” or “Partridge,” and “Wheat-sheaf” patterns in red and green and gold in imitation of the Japanese patterns; and the manufacture of table ware decorated with these simple yet bright and pleasant devices seems to have formed the greater part of the work at the factory. Many figures and statuettes were also produced at Bow, but they are fewer in number and less cleverly made and decorated than the contemporary productions of the Chelsea factory. We may surmise that there was considerable rivalry between these two works situated on the outskirts of the metropolis, for we find the “anchor” mark, which is the best recognized mark of Chelsea porcelain, often covered with a series of other marks that is from internal evidence or from the piece itself we should rather attribute to Bow. The Bow marks are not very certain, but some of the likeliest are here given.

**Worcester.**—The third of the early English factories, and ultimately the most important of all, was that founded at Worcester in 1751 by Dr Wall, a man of unusual attainments, and a number of his friends. How Dr Wall came to learn the secret of porcelain making is absolutely unknown, but even assuming that he acquired some information from wandering workmen it is certain that the Worcester porcelain was soon developed on original lines. The nature of the paste and the glaze of the early Worcester productions, as well as the sobriety of their decorations, stamp this factory as the first where Englishmen really developed a native porcelain. Between 1751 and 1770, the first period of Worcester porcelain, the prevalent influence was that of Chinese blue-and-white, and the pieces of that period are rightly esteemed by collectors for their artistic quality. Probably nowhere in Europe, certainly nowhere in England, was oriental blue-and-white more eagerly studied, and a collection of this blue-and-white Worcester is most satisfactory from the aesthetic point of view. The productions at this time were tea and coffee services, bowls, dishes, mugs and plates. The cups were usually made without handles in imitation of the oriental practice, but large, two-handled covered cups for caudle, broth and chocolate were also made during the early period. Many of these larger cups bore an embossed pattern resembling a pine-cone, possibly imitated from a shape produced at St Cloud; while openwork dishes, plates and fruit baskets were also made in imitation of a popular Meissen fashion.

The method of decorating porcelain with transfer prints was introduced at Worcester as early as 1756, when Robert Hancock, an engraver, came from York House, Battersea, where the process was first employed for the decoration of the Battersea enamels. The early Worcester prints comprised portraits of celebrities of the time (the Frederick the Great mug), or adaptations of the works of great artists such as Gainsborough and Watteau, or copies of current engravings or sporting prints. The first printing was done in black or purple, and transferred on to the fired glaze, and oriental blue and white about 1770 that the process of printing in blue under the glaze was perfected. It is interesting to note that for many years this process of transfer printing was developed side by side with the older method of porcelain painting, and until the end of the 18th century the processes appear to have been used at Worcester quite independently. The closing of the Chelsea factory in 1770 led to the migration of some of the Chelsea painters to Worcester, and from about that date a considerable amount of Worcester porcelain was decorated on the glaze with enamel colours and gilding after the styles that had been rendered popular at Chelsea and Bow. It is only fair to remark, however, that the Worcester patterns are always distinguished by a certain English character both in the style and the workmanship (see example, Plate X.). The first and most artistic period of Worcester porcelain came to an end before 1783, when, after the death of Dr Wall, the works passed under the control of Thomas Flight and his two sons, who had been jewellers. The Flight influence was soon noticeable from the fact that the new shapes were more and more based on those of Sévres and Meissen, while the decoration became more mechanical and precise as befitted the work of jewellers rather than potters. King George III. and Queen Charlotte visited the works in 1788 and bestowed upon the firm the privilege of styling themselves “China Manufacturers to Their Majesties,” since when the works has always been known as the Worcester Royal Porcelain Works. In 1793 Martin Barr was taken into partnership; the “Flight & Barr” period, so well known to collectors, lasted until 1807.

Another Worcester porcelain works was in existence after 1788, viz. the Chamberlain factory, which was working in rivalry with the original establishment; but its productions are of no particular artistic merit, and in 1840 the two firms became amalgamated, and so gave rise to the present Worcester Royal Porcelain Co. The most noteworthy feature of the productions of both the Worcester works at the end of the 18th century were the “Armorial” services made for various royal and noble families, and those adaptations of Iznari patterns known as “Old Japan.”

**Derby.**—Experiments in the manufacture of porcelain appear to have been made at Derby as early as 1750 by a French refugee, Andrew Planché; but the business, which was afterwards to attain such a great development, was only founded in 1756 with William Duesbury as its manager. Duesbury was originally a decorator of china figures in London, and his career proves that he was a man of great industry and energy, for within twenty-five years he not only built up a large business at Derby, but he absorbed the decadent works at Bow and Chelsea, so that in the last quarter of the 18th century Derby was the most important china manufactory in England. As is so often the case, a commercial success like this implied the absence of any distinct artistic impulse. The porcelain produced at Derby is for the most part only an echo of the successes of Meissen, Sévres, or the earlier English factories. It is only fair to remark that a very deep and rich under-glaze blue was attained at the Derby works, and that this was associated with very mechanical painting of birds and flowers and with gilding of exceptional quality. At this factory, too, the old Japan patterns were imitated with exceptional vigour, until “Crowne-Derby Japan” became a standard trade name for this clobbered oriental style.

Mention has already been made of the “biscuit” porcelain figures made at Derby, which are superior in style to anything else made in Europe in the 18th century except the “biscuit” porcelains of Sévres. The Derby “biscuits” of the best type range from 1790 to 1810, and the finest specimens have a waxy surface, though there is little or no sheen and every物流 remains as crisp as when the figure left the hand of its maker. The most famous of these figures are the portrait medallions and statuettes of British generals and admirals which were modelled by an artist named Stephan. Spengler, a Swiss, modelled numerous groups adopted from the drawings of Angelica Kaufmann, while a workman named Coffee seems to have modelled only rustic figures and animals.

**Plymouth and Bristol.**—The porcelain factories at Plymouth
and Bristol are mainly noteworthy because they were the only English factories in which a true porcelain strictly analogous to the Chinese was ever manufactured. William Cookworthy, a Quaker druggist of Plymouth, was greatly interested in attempting to discover in Cornwall and Devonshire minerals similar to those which were described in the letters of Père d'Entrecalles as forming the basis of Chinese porcelain. After many years of travel and research he ascertained the nature of the Cornish stone and Cornish clay, and in 1768 he founded a works at Plymouth for the production of a porcelain similar to the Chinese from these native materials. Readers interested in this abortive enterprise, from which such great results were afterwards to come, can only be referred to the general histories of English porcelain, for the factory was removed to Bristol in 1770 and was shortly afterwards transferred to Richard Champion, a Bristol merchant, who had already been dabbling in the fashionable pursuit of porcelain making. Champion's Bristol factory lasted from 1773 to 1781, when the business had to be sold to a number of Staffordshire potters owing to the serious losses it had entailed. The Bristol porcelain, like that of Plymouth, was always a true felsite-patrician porcelain resembling the Chinese, but made from the china clay and china stone of Cornwall. It is, therefore, harder and whiter than the other English porcelains, and its cold, harsh, glittering glaze marks it off at once from the wares of Bow, Chelsea, Worcester or Derby. The Bristol porcelain resembled that of Meissen quite as much in its style of decoration as in the nature of its materials. One can point to nothing distinctly English about it, and if specimens now command very high prices in the salerooms it is on account of their rarity rather than of any intrinsic quality or beauty that they possess.

Table ware of various kinds formed the greater part of the production of the Bristol works, but a considerable number of figures are known, in many cases obviously copied from those of Meissen. The hexagonal medallion medallion, for example, was a style peculiar to the Bristol factory and was transferred to Spode, Davenport and Minton became the most important English factories of the early 19th century. For notices of the minor English factories of the late 18th century and early 19th century, such as Caughey, Coalport, Swansea and Nantgarw, the reader is referred to the special works dealing with the history of English porcelain.

Collections.—The British Museum and the Victoria and Albert Museum contain the best general collections of English porcelain. The museums at Bristol and Liverpool contain examples of the local ware. While the Chester Royal Porcelain works has an admirable collection of the wares of all the factories. Many noteworthy private collections are in existence, of which we may mention those of Mr. Dyson Perrins, Mr. Cockshutt and Mr. Trapnell.

POTTERY AND PORCELAIN DURING THE 19TH CENTURY

The development of the manufacture of pottery and porcelain in Europe and America throughout the 19th century need not be treated in such detail as the history of its growth up to that period, for modern means of communication and the general diffusion of knowledge have tended to destroy the individual character which was so marked a feature of the pottery of different countries in previous centuries. The 19th century was distinctly the century of machinery, and, for the most part, it witnessed the displacement by mechanical methods of those methods of handicraft which made the older pottery industry large and interesting even in its simplest forms. Collectors are prepared to pay very large sums for choice examples of the potter's art of bygone centuries, but it is doubtful if much of the pottery of the 19th century will ever be collected for its intrinsic merits, though it may be preserved as an illustration of the spirit of the age.

In preceding sections of this article the development of the brightly painted tin-enamelled wares and the gaily decorated porcelains of various European countries have been traced down to the end of the 18th century, because that date marks, quite distinctly, the period when the old handicraft of the potter was for various reasons displaced by organized manufacture. The disturbed economic condition of Europe in the last quarter of the 18th century and the Napoleonic Wars of the early 19th century threw disastrous checks on the pottery and porcelain works where artistic wares were made, and the deterioration of artesan methods was completed by the superior mechanical perfection and cheapness of the English earthenware introduced by Wedgwood and his contemporaries. The English pottery was nearer, more perfectly finished and more durable than the painted tin-enamelled pottery of the continent. It vied in finish with the expensive continental porcelains, and for nearly half a century it carried all before it, not only in England, but throughout the world.

An intelligent observer, M. Faujas de Saint Fond, writing in the beginning of the 19th century, remarks of English pottery that its "excellent workmanship, its solidity, the advantage which it possesses of sustaining the action of fire, its fine glaze impenetrable to acids, the beauty and convenience of its form, and the cheapness of its price, have given rise to a commerce so active and so universal, that in travelling from Paris to Petersburg, from Amsterdam to the farthest parts of Sweden, and from Dunkirk to the extremity of the south of France one is served at every inn upon English ware. Spain, Portugal and Italy are supplied with it; and vessels are loaded with it for the East Indies, the West Indies, and the continent of America."

It was calculated that at this time three-fourths of the pottery manufactured in England was sent abroad. Such a state of things was not likely to continue, and in most of the European countries, after the settlement of 1815, such of the older factories as had survived, or new factories specially created for the purpose, adopted English methods of manufacture. In many cases

From the artistic point of view there is little to be said for the majority of productions of the Berlin factory, but nowhere in the world has greater attention been paid to the technical and scientific problems of porcelain manufacture, and this establishment has rendered the greatest service in the development of the important chemical and electrical industries of Germany by the splendid appliances it has invented for scientific use.

Since 1870 the works, removed to Charlottenburg, have been conducted with very great enterprise. It was here that Seger perfected his soft porcelain based on the glazes and bodies of the best Japanese porcelains, and here also he developed the manufacture of copper-red glazes in imitation of the old sang-de-boeuf and flambé glazes of the Chinese, at the same time establishing some of the scientific principles underlying their production. At Berlin, too, all the modern methods of decoration, whether in coloured glazes, raised enamels, pâte sur pâte, the elaborate paintings of flowers, birds or figures, or the use of crystalline glazes, have been followed with great success; but the factory has never yet given any special impetus or new direction to the decorative side of porcelain.

Sèvres.—The important part played by the Royal French manufactury at Sèvres has already been sketched. During the troubleous years of the French Revolution the works practically came to a standstill, and under the Directory it was a question whether this manufactury, along with certain other state establishments in France should not be dissolved. Nevertheless, Napoleon, having decided that for the glory of France and as a means of encouraging its porcelain industry, seriously threatened by the English potters, the establishment at Sèvres should be conducted as a national factory. By a splendid coincidence Alexander Brongniart, a man of great natural ability, and a noted scientist, was appointed director, and retained that post under the successive governments of France until his death in 1847. In the hands of Brongniart the establishment at Sèvres became at once a school of research and a centre of practical accomplishment—the influence of which was felt throughout Europe. Its products were obviously inspired by the demands of successive French monarchs and their courts. It ministered to the grandiose ideas of Napoleon, who demanded pieces that were to speak of his victories, and after every campaign a fresh table service or new suite of vases was produced to commemorate the emperor’s successes. The most striking piece of this kind was the vase made to commemorate the marriage of Napoleon and Marie Louise in 1810. It was designed by Isabey and was modelled with figures in bas-relief. The principal group contains not less than 115 such figures, while the subsidiary group, representing the acclaiming populace, contains between 2000 and 3000 figures. This vase was three years in making, and is said to have cost something like £1250. Unfortunately this was not a solitary example of the productions of Sèvres, for under every successive government of the 19th century the factory has been called to produce enormous vases which are to be found in the rooms or corridors of every palace and museum in France, and while these pieces represent wonderful technical skill, both in their manufacture and the decorations with which they are covered, very few of them possess either spontaneity or charm. They are correct, frigid, cold, and compare most unfavourably from
the artistic point of view with the masterpieces of oriental pottery. Everything was carried out on the grand scale, and once again the influence of Sévres became paramount in Europe, and its styles of painting and decoration were eagerly followed from 1830 to 1870 by all those European potters who were attempting to make anything beyond useful domestic wares. As an instance of its aims in the period between 1830 and 1850, large sums were spent in the production of great slabs of porcelain many feet in area, on which were painted copies of some of the famous portraits and other pictorial masterpieces in the galleries of the Louvre. A number of these are preserved in the museum at Sévres, and must always excite admiration and even wonder at their technical accomplishment.

The most noticeable invention of Sévres in the middle part of the 19th century was the pâte sur pâte decoration in which porcelain clays of various colours are used as the artist’s medium. The idea appears to have been adopted from an old Chinese vase by Robert, the chief painter, and at the London International Exhibition of 1862 some small cups decorated in this method, by Gely, were first shown. The most successful work in this style was, however, that produced by M. Solon, who worked at Sévres until 1870. In that year he came to England and was employed at Minton’s, where for about thirty-five years he continued this method of work, one of the few artistic and beautiful styles of pottery decoration of the 19th century. As practised by M. Solon the pâte sur pâte decoration took the form of paintings of figure subjects or dainty ornamental designs in white slip on a coloured porcelain ground of green, blue, dark-grey or black. On such grounds a thin wash of the slip gives a translucent film, so that by washing on or building up successive layers of slip, sharpening the drawing with modelling tools, or softening or rounding the figure with a wet brush, the most delicate gradations of tint can be obtained, from the brilliant white of the slip to the full depth of the ground. This method was rapidly adopted by all the principal European factories, though nowhere was it carried to such perfection as at Sévres and at Minton’s. M. Charles Doaz has executed many extraordinary pieces in this style of decoration at Sévres, and in the British Museum there is a large vase of his, presented by the French government at the beginning of the present century. One great feature of French porcelain manufacture during the 19th century was the development of the industry at Limoges and the neighbouring district of central France. Limoges was a small centre of porcelain production in the period between 1780 and 1850, but after the latter date it rapidly developed into a pottery centre second only in importance to that of the Potteries district in England. We can do no more than mention this fact, because, for the most part, the activities of Limoges have been devoted to the production of pottery commercially, rather than pottery as an art.

The Franco-German War proved a disaster for Sévres, and all work came to a standstill for a time. The existing manufacture, which was almost completed before the outbreak of the war, was opened by Marshal MacMahon in 1876, but for many years the works was continued under great discouragement. Between 1870 and 1880 rebuilding was paid to the study and imitation of old Chinese methods, and this resulted in the reproduction of many of those Chinese glazes which had hitherto been the despair of European potters.

At the Paris Exhibition of 1900 the display made by Sévres was perhaps the most notable feature of the magnificent collection of ceramics gathered there. The collection included many varieties of porcelain, both hard and soft paste, decorated in all the current styles of the period; under-glaze painting, on-glaze painting, flambe glazes and crystalline glazes, but most beautiful of all were the magnificent groups of "biscuit" figures designed as table garnitures by some of the best French sculptors of the time.

Eng. Progress.—The demand for elaborate specimens of painted porcelain was at its height throughout Europe between 1851 and 1880, and this demand was undoubtedly fostered by the series of international exhibitions held during that period, when every European pottery works of note produced large and costly specimens of porcelain or earthenware, smothered with painting and gilding. Every famous manufactory produced something beyond the ordinary, but undoubtedly the first of European factories during this period was that of Messeus Minton at Stoke-upon-Trent. M. Leon Arnoux, a descendant of the Arnoux’s of Apt, an old family of French potters, was at this time the technical and artistic director of Messrs Minton’s works, and he was the only pottery director during the 19th century who could in any sense be compared with M. Brongniart of Sévres. M. Arnoux combined in a remarkable degree artistic with technical skill, and under his management the works of Messrs Minton became the greatest centre of ceramic art in Europe. Skilled modellers, like Jeannest, Carrière-Bellegue, and Protat, and pottery painters such as A. Boullemier, Mossill, E. Lessore and L. Solon were engaged at this factory and produced many of the most characteristic European decorations of the middle of the 19th century.

To this period, too, we must refer another English invention, that of a special porcelain known as “Parian.” This in its finest expression was a “biscuit” porcelain used for the production of statuettes and groups rivalling the finest 18th century “biscuit” figures of Sévres and Derby. It seems probable that this Parian was first made at the works of Copeland and Garratt, at Stoke-upon-Trent; but it was immediately adopted at Minton’s, Wedgwood’s, and at Worcester; and each of these firms used it in a distinctive way. Glazed Parian was also manufactured at the Belleek Porcelain Works in Ireland (the only Irish porcelain works of any note), and later its manufacture was developed by the Worcester Royal Porcelain Company, Moore Brothers of Longton, and other English manufacturers until it became an important branch of the English porcelain made in the period under review.

Jap. Influence.—At the Paris Exhibition of 1867 the great collection of the applied arts of Japan took Europe by storm, and there was an immediate outbreak of adaptations of Japanese art in Europe once more; not as in the 18th century, when the art in Chinese patterns were copied or frankly imitated, but a European-Japanese style arose, based on the methods and ideas of the great Japanese painters and draughtsmen, the workers in metal, in iron, in lacquer and in silk. In England the Worcester Royal Porcelain Company produced a series of elaborate and skilful pieces inspired from this source, which for perfect and minute execution must be ranked before all other European works of their kind.

The most admirable result of this revived interest in Japanese art was, however, developed at the Royal Copenhagen works, the productions of which are not only famous all over the world, but have set a new style in porcelain decoration which is being followed at most of the continental factories. By the use of the pure Swedish felspar and quartz and the finest china clays from Germany or Cornwall a material of excellent quality is prepared, and on this naturalistic paintings of birds, fishes, animals and water or northern landscapes and figure subjects are painted in delicate under-glaze blue, greens, and yellows. The Royal Copenhagen works has also produced a profusion of skilfully modelled animals, birds and fishes, either in pure white, or delicately tinted after nature, with the same under-glaze colours.

Not only have Berlin, Sévres and other European factories adopted the modern Copenhagen style of decoration, but the Japanese are now imitating these skilful productions which were originally inspired by their own early work.

Stone-ware.—Mention must be made of the revival of the manufacture of artistic stonewares by Doulton of Lambeth, and Villeroi and Boch, the great German potters. Doulton, besides reviving the older forms of English stoneware, made some entirely new departures, and their pieces with designs etched in the clay are admirable examples of the right use of a refractory material. Villeroi and Boch reproduced the old Rhenish stonewares, and many interesting new departures in addition, but mostly in German forms that have not commended the wares to other nations.

Artistic Results.—While the great potteries of Europe have been employed in improving their methods of manufacture and in consolidating their knowledge on the technical and scientific side, so that they are able to produce pottery more perfect in shape, with a higher degree of finish and greater certainty of result than was ever known before, it cannot be said that the artistic results have been commensurate with the labour expended. Fortunately, however, the success of these important industrial concerns in stereotyping modern production has incidented a considerable number of clever men, either potters or artists, to become artist-potters and producers of individual wares, often recalling the works of the great schools of bygone centuries. This movement, which to-day has its exponents in every European country as well as in the United States of America, originated in France between 1840 and 1850, when the formation of the earliest ceramic museums and the new-born interest in the old French faience led to various attempts at pottery-making by the old methods of handwork and rule of thumb. Avisseau de Tours (1843), Pull of Paris (1855), and Barbizet (1859) began to make pieces in the style of Palissy, and Ulysse de Blois (1863) revived painting in imitation of those of so many artists. Slowly the demand for painted pottery was created among collectors and amateurs, and in France and other countries artists began to dabble in the painting of pottery. In some cases the artist retained his freedom, painting pieces obtained from some pottery manufacturer, who sold on his own account after they had been decorated and fired; or he became attached to a particular factory and his productions were sold by the potter; or the artist became an amateur potter, and either worked alone or encouraged other artists to co-operate with him.

It is impossible to do more than mention a few of the prominent men in each class, whose works were not only esteemed in their own day, but are also likely to be regarded always as among the distinguished productions of the 19th century. Emile Lessore and Chapelot were both painters who were attracted by the technique of the potter. For some time they bought specimens of pottery from a small manufacturer named Laurin at Bourg-la-Reine, and after a time they definitely forsook pictorial art for that of the potter. Lessore painted in underglaze colours in a delicate sketchy style figure-subjects, mostly adapted from old engravings. He worked for a short time at Sèvres, and then, like so many other French pottery artists of this period, he came to Minton's in England, and finally entered into an engagement with the old firm of Josiah Wedgwood & Sons which continued almost to his death (1860-1876). On their fine cream-coloured earthenware he sketched many thousands of fanciful designs which had a great vogue in the 'seventies and 'eighties of the last century. Chapelot pursued a very different course. His first innovation was a method known as "Barbotine" or slip-painting, in which coloured clays were used "impasto," often in considerable thickness, so that after the work had been fired and glazed it bore some resemblance to an oil painting. For a few years this style of decoration became the rage all over Europe, but it fell into contempt almost as rapidly as it had found favour, and is now only used for the decoration of common wares. Ultimately, Chapelot gave up painting and applied himself to the discovery of technical novelties. He was apparently the first European potter to produce flambé glazes after the manner of the Chinese, and a fine collection of these productions of his is preserved in the museum at Sèvres.

The greatest of all the French innovators was, however, Théodore Deck, who had been trained as a working potter and was led to forsake the management of an ordinary tile and pottery business in Paris to experiment on his own account. He started a little workshop in the Boulevard Montparnasse in Paris and rapidly gathered round him a number of young painters all eager to experiment in the magnificent colours which Deck had cultivated, and his passionate love of Persian and other oriental pottery, and at their disposal. Within a few years this venture was so successful that Deck was known all over the civilized world as a great potter, and his original creations, painted by men like Ranvier, Collin, Ehrmann, Anker and other artists, were readily purchased by the lovers of ceramic art in every country. The crown of his career came in 1887, when he was appointed director of the National Manufactory at Sèvres, for he was the only practical potter who had ever occupied that position; but he died in 1890 before he had been able to impress his personality on the work of Sèvres.

The same movement that was active in France found its exponents in other countries as well. In Italy and the south of France the last quarter of the 19th century witnessed a revival of Italian majolica and of lustre decoration. Prominent in this direction were the productions of Cantegalli of Florence and of the Massiers of Golfe-Juan near Cannes; while in England William de Morgan created an artistic sensation by his tiles and vases decorated with lustres, or with painted colours recalling those of the Persian and Syrian potteries of the middle ages. This departure in England was, however, followed up by many manufacturers who were keenly alive to the possibilities of pottery colour, and Mr. Bernard Moore, of Longton, Maw & Company of Jackfield, and Minton's of Stoke-upon-Trent, produced much excellent work, in tiles and vases inspired from the same oriental sources.

Meanwhile, in America there had been growing up a manufacture of pottery after the approved methods, in Trenton, New Jersey; East Liverpool, Zanesville and Cincinnati (Ohio). To all these centres English workmen had been attracted, and earthenware after the current English styles was manufactured; but, as was the case in Europe, individual efforts were made to produce artistic pottery. The first and best-known of these artistic departures was that of the Rookwood Pottery at Cincinnati, and again it was an amateur, Mrs. Bellamy Storer, who founded an enterprise which has since produced some very original work. From 1880 to 1889 the work was mainly carried on at the expense of this lady, but since that date the enterprise has been self-supporting, and the Rookwood pottery has become known throughout the world.

The latter half of the 19th century also witnessed the development of new branches of pottery manufacture for sanitary purposes—and it is not too much to say that much of the improved sanitation of modern dwellings and towns has been rendered possible by the special appliances invented by potters for these purposes. This work, of course, is becoming very important, and we have already spoken of the work of Mr. Lincott in America and of the many successful factories in France; but, besides, English manufacturers have also established large works in Germany, France and the United States of America. Varieties, too, of hard-fired pottery, comprising earthenwares, stonewares and porcelains, have been invented for use in the chemical and electrical industries. But these belong to the great modern branch of pottery manufacture, not to pottery art. In the same way, the revived attention paid to the various forms of pottery for the interior and exterior of buildings belongs rather to the question of mural decoration than of pottery.

At the beginning of the 20th century we find England and Germany the leading pottery manufacturing countries; Germany excelling in the amount of its output, and England in the fineness and finish of its productions. France, in addition to the National Manufactory at Sèvres, as much as ever divorced from commerce, has its porcelain industry at Limoges and large manufactories of tiles and earthenware in many departments; while there are also a number of artist potters like Lachenal, Dalpayrat, Delerche and Tasile. Dost, who make purely artistic pottery in hard-fired stonewares (grès) and porcelain, while the production of decorative stonewares for building purposes has been developed by such firms as Bigot, Boulanger and E. Müller. A great development has also taken place in the production of decorative pottery and tiles in Holland. The famous Delft works, besides producing quantities of painted blue and white earthenware (made in the English and not in the old Dutch fashion), has been experimenting largely in the development of crystalline and opalescent glazes and in lustres, while the Rozenburg factory at the Hague and a factory at Purmerend, near Amsterdam, have made some distinctive but rather bizarre painted pottery and porcelain. The success of the Royal Copenhagen factory has
already been mentioned, and this success led to the foundation of Bing & Gröndahl of Copenhagen, who largely follow the styles of decoration initiated at the Royal works. In Sweden there are two important factories at Röstrand and Gustafsberg. Under the accomplished director of the Röstrand factory, Mr Robert Almström, a great variety of products have been successfully manufactured, including hard-paste porcelain, English bone china, earthenware, majolica and stoves. Italy, Spain and Belgium have also important modern pottery works.

In the United States of America there are large establishments for the manufacture of earthenware, bone china and tiles, all after the English fashion, while in addition there are a number of experimental kilns at work producing artistic pottery. The Rookwood factory has already been mentioned, but the wares produced at the Grueby factory and by Mrs Robinou and T. Brouwer are also worthy of note. (See "Report on American Art Pottery," pp. 922-935 of Special Reports of the U.S. Census Office, Manufactures, pt. iii., 1905.)

Technical Pottery Works.—It is only possible to give a selection of the best of the modern standard works dealing with the technical side of pottery production. Bronnient, Traité des arts céramiques (3rd ed., Paris, 1877), with notes and additions by Salvetat; E. Bourry, Traité des industries céramiques (Paris, 1897); Théodore Déchard, Céramique industrielle (3rd ed., Paris, 1917); A. M. Meunier, La Céramique industrielle (Paris, 1905); E. S. Außerer, La Céramique cuisinière à haute température (Paris, 1899); Technologie de la céramique (Paris, 1901); Les Industries céramiques (Paris, 1901); Seger, Gesammelte Schriften (Berlin, 1890, 1892; Easton, Pa., U.S.A., 1902); De Laubee, The Chemistry of Pottery (Easton, Pa., U.S.A., 1895); William Burton, Porcelain (London, 1906).

Cerargyrite—Ceres

Cerargyrite, a mineral species consisting of silver chloride; an important ore of silver. The name cerargyrite is a Greek term (from κρίας, horn, and θυρύγως, silver) of the older name hornsilver, which was used by K. Gesner as far back as 1565. The chloro-bromide and bromide of silver were also included under this term until they were distinguished chemically in 1841 and 1842, and described under the names embolite and bromargyrite (or bromyrite) respectively; the chloride then came to be distinguished as cerargyrite, though the name cerargyrite is often now applied to this alone. Chloro-bromo-iodide of silver has also been recognized as a mineral and called iodargyrite. All these species are strikingly alike in appearance and general characters, differing essentially only in their chemical composition, and it would seem better to reserve the name cerargyrite for the whole group, using the names chlorargyrite (AgCl), embolite (AgCl, Br) iodargyrite (AgBr) and iodembolite (AgCl, Br, I) for the different isomorphous members of the group. They are cubic in crystallization, with the cube and the octahedron as prominent forms, but crystals are small and usually indistinct; there is no cleavage. They are soft (H = 3) and sectile to a high degree, being readily cut with a knife like horn. With their resinous to adamantine lustre and their translucency they also present somewhat the appearance of horn; hence the name hornsilver. The colour varies somewhat with the chemical composition, being grey or colourless in chlorargyrite, greenish-grey in embolite and bromargyrite, and greenish-yellow to orange-yellow in iodembolite. On exposure to light the colour quickly darkens. The specific gravity also varies with the composition: for the pure chloride it is 5.55, and the highest recorded for an iodembolite is 6.3.

The hornsilvers all occur under similar conditions and are often associated; they are found in metallic veins with native silver and ores of silver, and are usually contoned to the upper oxidized parts of the lodes. They are important ores of silver (the pure chloride contains 75.3% of silver), and have been extensively mined at several places in Chile, also in Mexico, and at Broken Hill in New South Wales. The chloride and chloro-bromide have been found in several Cornish mines, but never in very large amounts.

(L. J. S.)

Cerberus, in Greek mythology, the dog who guarded the entrance to the lower world. He allowed all to enter, but seized those who attempted to escape. According to Hesiod (Theog. 311), he was a fifty-headed monster with a fearful bark, the offspring of Typhon and Echidna. He was variously represented with one, two or (usually) three heads, often with the tail of a snake or with snakes growing from his head or twined round his body. One of the tasks imposed upon Heracles was to fetch Cerberus from below to the upper world, a favourite subject of ancient vase-painting.

Cerdic (d. 534), founder of the West Saxon kingdom, is described as an alderman who in 495 landed with his son Cynric in Hampshire, where he was attacked at once by the Britons. Nothing more is heard of him until 508, when he defeated the Britons with great slaughter. Strengthened by fresh arrivals of Saxons, he gained another victory in 519 at Cattiscersford, a spot which has been identified with the modern Charford, and in this year took the title of king. Turning westward, Cerdic appears to have been defeated by the Britons in 520 at Badbury or Mount Badon, in Dorset, and in 527 yet another fight with the Britons is recorded. His last work was the conquest of the Isle of Wight, probably in the interest of some Jutish allies. All the sovereigns of England, except Canute, Hardicanute, the two Harold and William the Conqueror, are said to be descended from Cerdic.

Cerdonians, a Gnostic sect, founded by Cerdon, a Syrian, who came to Rome about 137, but concerning whose history little is known. They held that there are two first causes—the perfectly good and the perfectly evil. The latter is also the creator of the world, the god of the Jews, and the author of the Old Testament. Jesus Christ is the son of the good deity; he was sent into the world to oppose the evil; but his incarnation, and therefore his sufferings, were a mere appearance. Regarding the body as the work of the evil deity, the Cerdonians formed a moral system of great severity, prohibiting marriage, wine and the eating of flesh, and advocating fasting and other austerities. Most of what the Fathers narrate of Cerdon's tenets has probably been transferred to him from his famous pupil Marcion, who he is said to have rejected the Old Testament and the New, except part of Luke's Gospel and of Paul's Epistles. (See Marcion, and Gnosticism.)

Cerealis (Cerialis), Petillius, (1st century A.D.), Roman general, a near relative of the emperor Vespasian. He is first recorded during the reign of Nero in Britain, where he was completely defeated by the Iceni. Eight years later he played an important part in the events that followed the departure of Vespasian. In 70 he put down the revolt of Civilis (g.n.). In 71, as governor of Britain, where he had as a subordinate the famous Agricola, he inflicted severe defeats upon the Britons, the most powerful of the tribes of Britain. Tacitus says that he was a bold soldier rather than a careful general, and preferred to stake everything on the issue of a single engagement. He possessed natural eloquence of a kind that readily appealed to his soldiers. His loyalty towards his superiors was unshakable.

Tacitus, Annals, xiv. 32; Histories, iii. 59, 78, iv. 71, 75, 86, v. 21; Agricola, 8, 17.

Ceres, an old Italian goddess of agriculture. The name probably means "the creator" or "created," connected with cresceo and creare. But when Greek deities were introduced into Rome on the advice of the Sibyline books (in 495 B.C., on the occasion of a severe drought), Demeter, the Greek goddess of food and harvest, whose worship was already common in Sicily and Lower Italy, usurped the place of Ceres in Rome, or rather, to Ceres were added the religious rites which the Greeks paid to Demeter, and the mythological incidents which originated with her. At the same time the cult of Dionysus and Persephone (see Liber and Libera) was introduced. The rites of Ceres were Greek in language and form. Her priestesses were Italian Greeks and her temple was Greek in its architecture and built by Greek artists. She was worshipped almost exclusively by plebeians, and her temple near the Circus Maximus was under the care of the plebeian aediles, one of whose duties was the superintendence
of the corn-market. Her chief festivals were the ludi Ceres or Cerialia (more correctly, Ceridia), games held annually from April 12–19 (Ovid, Fasti, iv. 392 ff.); a second festival, in August, to celebrate the reunion of Ceres and Proserpine, in which women, dressed in white, after a fast of nine days, offered the goddess the first-fruits of the harvest (Livy xxi. 56); and the Jambium Ceres, a fast also introduced (191 B.C.) by command of the Sibyline books (Livy xxxvi. 37), at first held only every four years, then annually on the 4th of October. In later times Ceres was confused with Tellus. (See also DEMETER.)

CERIGNOLA, a town of Apulia, Italy, in the province of Foggia, 26 m. S.E. by rail from the town of Foggia. Pop. (1901) 34,195. It was rebuilt after a great earthquake in 1731, and has a considerable agricultural trade. In 1503 the Spaniards under Gonzalo de Cordoba defeated the French under the duc de Nemours below the town—a victory which made the kingdom of Naples into a Spanish province in Italy. Cerignola occupies the site of Furiane, a station on the Via Traiana between Caesanum and Herdoniae.

CERIGOTTO, called locally Lusus (anc. Aegilia or Oggylos; mod. Gr. officially Antikythera), an island of Greece, belonging to the Ionian group, and situated between Cythera (Cerigo) and Crete, about 20 m. from each. Some raised beaches testify to an upheaval in comparatively recent times. With an area of about 10 sq. m. it supports a population of about 500, who are mainly Cretan refugees, and in fact very few peasants support a good wine. It was long a favourite resort of Greek pirates. It is famed for the discovery in 1900, close to its coast, of the wreck of an ancient ship with a cargo of bronze and marble statues.

CERITUS (c. A.D. 100), an early Christian heretic, contemporary with the closing years of the apostle John, who, according to the well-known story of Polycarp, reported by Irenaeus (iii. 3) and twice recorded in Eusebios (Hist. Eccl. iii. 28, iv. 14), made a hasty exit from a bath in Ephesus on learning that Cerithus was within. Other early accounts agree in making the province of Asia the scene of his activity, and Hippolytus (Hær. vii. 33) credits him with an Egyptian training. There can be no truth in the notion given by Epiphanius (Hær. xxviii. 4) that Cerithus had in earlier days at Jerusalem led the judaizing opposition against Paul.

The difficulty of defining Cerithus's theological position is due not only to the paucity of our sources but to the fact that the witness of the two principal authorities, Irenaeus (i. 26, iii. 11) and Hippolytus (Symmaga), does not agree. Further, Irenaeus himself in one passage fails to distinguish between Cerithian and Valentinian doctrine. Whatever it was, it was strengthened, by Cerithus's stress on the rite of circumcision and on the observance of the Sabbath. He taught that the world had been made by angels, from one of whom, the god of the Jews, the people of Israel had received their Law, which was not perfect. The only New Testament writing which he accepted was a mutilated Gospel of Matthew. Jesus was the offspring of Joseph and Mary, and on him at the baptism descended the Christ,1 revealing the hitherto unknown Father, and endowing him with miraculous power. This Christ left Jesus again before the Passion, and the resurrection of Jesus was still in the future. Together with these somewhat gnostic ideas, Cerithus, if we may trust the notices of Gaius the Roman presbyter (c. 250) and Dionysius of Alexandria (c. 340), held a violent and crude form of chiliastic. But the chief significance of the man is his "combination of zeal for legal observances with bold criticism of the Law itself as a whole and of its origin," which reminds us of the Clementine Recognitions. Cerithus is a blend of Judaizing Christian and gnostic.

CERIUM (symbol Ce, atomic weight 140-25), a metallic chemical element which occurs in the rare earths in the minerals cerianite, samarskite, eudialyte, monazite, patridge, and many yttrium minerals. The particular earth containing cerium was discovered by M. H. Klaproth in 1803, whilst J. Berzelius at about the same time also examined it and came to the conclusion that it was the oxide of a new metal, which he termed cerium. The crude oxide of the metal is obtained from cerite, by evaporating the mineral with strong sulphuric acid, removing excess of acid by warming, dissolving the residue in ice-cold water; sulphurated hydrogen is passed through the solution, which is then filtered, acidified with hydrochloric acid, and precipitated as oxalate by oxalic acid; the oxalate is then converted into oxide by ignition. From the crude oxide so obtained (which contains lanthanum and didymium oxides) the cerium may be separated by conversion into its double sulphate on the addition of potassium sulphate, the sulphates of the cerium group being insoluble in a saturated solution of potassium sulphate. The sulphate is subsequently boiled with water, when a basic sulphate is precipitated. For the preparation of pure cerium compounds see Auer v. Welsbach, Monatshefte, 1884, v. 508.

The metal was first obtained, in an impure state, by C. G. Mosander, by fusing its chloride with sodium. W. F. Hillebrand and T. Norton have prepared it by the electrolysis of the melted chloride (Pogg. Ann., 1875, 156, p. 466); and C. Winkler (Berichte, 1891, xxiv. 884) obtained it by heating the dioxide with magnesium powder. The metal has somewhat the appearance of iron, and has a specific gravity of 6-028, which, at melting, is increased to 6-721. It is white or pale yellow, and is a poor conductor of heat. It is produced when cerium carbonate, nitrate, sulphate or oxalate is heated in air. It is a white or pale yellow compound, which becomes reddish on heating. Its specific gravity is 6-739, heat of fusion 80°. It is not reduced to powder by the action of concentrated nitric acid.

Three oxides of cerium are known. The sesqui-oxide, CeO₂, is obtained by heating the carbonate in a current of hydrogen. It is a bluish-green powder, which on exposure rapidly combines with the oxygen of the air. By the addition of caustic soda to cerous oxalate, a white precipitate of cerous hydroxide is obtained. Cerous hydroxide, CeO₂, is produced when cerium carbonate, nitrate, sulphate or oxalate is heated in air. It is a white or pale yellow compound, which becomes reddish on heating. Its specific gravity is 6-739, heat of fusion 80°. It is not reduced to powder by the action of concentrated nitric acid. Concentrated sulphuric acid dissolves this oxide, forming a yellowish solution and ozone. By suspending the precipitated cerous hydroxide in water and passing chlorine through the solution, an aqueous solution of ceric chloride, Ce₅(OH)₇Cl₃, is obtained, which is readily soluble in nitric and sulphuric acids, forming ceric salts, and in hydrochloric acid, where it forms ceric chloride, with liberation of chlorine. A higher hydrated oxide, CeO₂·H₂O, is formed by the interaction of cerous sulphate with ceric sulphate (Lecoq de Boisbaudran, Comptes rendus, 1885, 100, p. 605).

Ceric chloride, CeCl₃, is obtained when the metal is burned in chlorine; when a mixture of cerous oxide and carbon is heated in a current of dry, rapid heating of the oxide, in a stream of carbon monoxide and chlorine. It is a colourless substance, which is easily fusible. A hydrated chloride of composition 2CeCl₃·15H₂O is also known, and is obtained when a solution of cerous oxide in hydrochloric acid is evaporated to a dry residue. Double salts of cerous chloride with stannic chloride, mercuric chloride, and platinic chloride are also known. Cerous bromide, 2CeBr₃·3H₂O, and iodide, CeI₃·9H₂O, are known. Cerous sulphate, Ce₂(SO₄)₃, results on heating cerous hydroxide with sulphuric acid in a fuming vapour. It is a red insubtle mass of specific gravity 5·1, and is slowly decomposed by warm water. The sulphate, Ce₂(SO₄)₃, is formed on dissolving the carbonate in sulphuric acid, or on dissolving the basic sulphate in sulphuric acid; it is a white powder of specific gravity 5·1. It is not reduced to powder by the action of the solution, and drying the product obtained, at high temperature (B. Brauner, Monatshefte, 1885, vi. 793). It is a white powder of specific gravity 3·912, easily soluble in cold water. Many hydrated forms of ceric sulphate with potassium, sodium, ammonium, thallium and cadmium sulphates. Ceric fluoride, CeF₃·H₂O, is obtained when the hydrated dioxide is dissolved in hydrofluoric acid and the solution evaporated on the water bath (B. Brauner). The sulphate, Ce₂(SO₄)₃·4H₂O, is formed when the basic sulphate is dissolved in sulphuric acid; or when the dioxide is dissolved in dilute sulphuric acid, and evaporated in vacuo over sulphuric acid. It forms yellow crystals soluble in water; the aqueous solution on standing gradually deposits a mixture of composition 2Ce₂(SO₄)₃·3K₂SO₄·2H₂O, Ce₂(SO₄)₃·3(NH₄)₂SO₄·4H₂O are.
known. Nitrates of cerium have been described, as have also phosphates, carbonates, and a carbide.

Cerium compounds may be recognized by the red precipitate of ceric hydroxide, which is formed when sodium hypochlorite is added to a colourless cerous salt. For the quantitative determination of the metal, the salts are precipitated by caustic potash, the precipitate washed, dried and heated, and finally weighed as the dioxide.

The atomic weight of cerium has been determined by B. Brauner (Chem. News, 1893, lex. 93) from the solubility of the oxalate; the value obtained varying from 140.07 to 149.35.

CERNUSCHI, Henri (1821-1896), Italian politician and economist, was born of wealthy parents at Milan in 1821, and was destined for the legal profession. During his studies he became involved in the revolutionary movement. He played a conspicuous part in the insurrection at Milan in 1848, and also at Rome in 1849, where he had a seat in the National Assembly. On the collapse of the revolutionary government he was arrested (1850), but managed to escape to France, where he engaged in commerce and banking, became naturalized, and acquired a large fortune. He took a prominent part in opposing the Socialist movement, and in April 1870, having subscribed a large sum to the funds of a committee formed to combat the Napoleonic plebiscite, had to leave the country. In September the formation of the Third Republic caused him to return, but he soon left Paris and went to the East, whence he returned with a fine art collection, particularly of Japanese objects. Cernuschi is best known for his publications on financial questions, more especially bimetallism. Of the latter he was an ardent champion, and the word itself is commonly supposed to have originated with him—at least in its present English form it is first found in his "Silver Vindicadta" (1876). Among his other works may be mentioned: Mécanique de l'échange (1861); Illusion des sociétés coopératives (1886); Le Bimetallisme en Angleterre (1879); Le Grand Proces de l'Union latine (1884). He died at Mentone on the 12th of May 1896.

CEROGRAPHY (from the Gr. κηρος, wax, and γράφειν, to write), the art of painting in wax. (See ENSAUCIST PAINTING.)

CERRO DE PASCO, or Pasco, a mining town of Peru, capital of the department of Junin, 107 m. (221 m. by rail, via Oroya) N.E. of Lima. Pop. (1907 est.) 10,000. It is situated on the plateau of Bombok, 14,280 ft. above sea-level, and in the midst of one of the oldest and richest silver-mining districts of Peru. There were 342 silver mines in this district in 1830, and by the end of the 19th century the average annual output since the discovery of the mines in 1630 was estimated at 1,600,000 oz. A decline in the silver production having set in, the American company which had become owners of three-fourths of the mining properties in the district turned its attention to the extensive copper deposits there, built a railway to Oroya 83 m. distant, another, 25 m. long, to the coal-fields of Collariscuquia, north of Pasco, and then erected large smelting works (in which 2,500 men were regularly employed in 1907) 8 m. out of town and 4 m. from limestone beds. The railway to Oroya was completed in 1903, the coal mine branch and smelter later on, and in 1907 the copper output was 20,152,000 lb. The town of Pasco is badly built and unattractive, and is inhabited chiefly by mining labourers and their families. Its population is increased 30% in times of great mining activity. The name Cerro de Pasco is that of a "knot" of mountains uniting the two great ranges of the Andes at this point. (1856) The town has a population quantitatively determined.

CERTALDO, a town of Tuscany, Italy, in the province of Florence, 35 m. S.S.W. by rail and 18 m. direct from the town of Florence. Pop. (1901) town, 4,552; commune, 9,210. It was the home of the family of Giovanni Boccaccio, who died and was buried here in 1375. His house (of red brick, like the other houses of the town) was restored in 1835 and fitted up with old furniture. A statue of him was erected in the principal square in 1875. The Palazzo Pretorio, or Vicariato, the residence of the Florentine governors, recently restored to its original condition, has a picturesque façade and court adorned with coats of arms, and in the interior are various frescoes dating from the 13th to the 16th century. The town as a whole is picturesque, and lies on a hill 426 ft. above sea-level.

See R. Pantini, S. Gimignano e Certaldo (Bergamo, 1903), p. 101 seq.

CERUSITE, a mineral consisting of lead carbonate (PbCO3), and an important ore of lead. The name (sometimes erroneously spelled "cerusite") is from the Lat. cerussa, "white lead." "Cerussa nativa" was mentioned by K. Gesner in 1565, and in 1832 F. S. Beaudant applied the name cérusite to the mineral, whilst the present form, cerusite, is due to W. Haidinger (1845). Popular names in early use were lead-spar and white-lead-ore.

Cerusite crystallizes in the orthorhombic system and is isomorphous with aragonite. Like aragonite it is very frequently twinned, the compound crystals being pseudo-hexagonal in form. Three crystals are usually twinned together on two faces of the prism m110, producing six-rayed stellar groups (fig. 1 and 2) with the individual crystals intersecting at angles of nearly 60°. Twinning on the faces of the prism r110, the angles of which are also nearly 60°, produces a similar kind of grouping, but is much less common. Crystals are of frequent occurrence, and they usually have very bright and smooth faces. The mineral also occurs in compact granular masses, and sometimes in fibrous forms. It is usually colourless or white, sometimes grey or greenish in tint; it varies from transparent to translucent, and has an adamantine lustre. It is very brittle, and has a conchoidal fracture. Hardness 3-3½; sp. gr. 6-5. A variety containing 7% of zinc carbonate, replacing lead carbonate, is known as giesiasite, from Giesias in Sardinia, where it is found.

The mineral may be readily recognized by its characteristic twinning, in conjunction with the adamantine lustre and high specific gravity. It dissolves with effervescence in dilute nitric acid. Before the blowpipe it fuses very readily, and gives reactions for lead. Cerusite occurs in metallic veins in association with galena, and has been formed by the action of carbonate waters on the galena: it is therefore found in the upper parts of the lodes together with other secondary minerals, such as limonite. Finely crystallized specimens have been obtained from the Friedrichsenge mine near Ems in Nassau, Johanngeorgenstadt in Saxony, Mies in Bohemia, Phenixville in Pennsylvania, Broken Hill in New South Wales, and several other localities. Delicate acicular crystals of considerable length were found long ago in the Pentire Glaze mine near St Minver in Cornwall. It is often found in considerable quantities, and contains as much as 77½% of lead.

CERUTTI, Giuseppe Antonio Giachimo (1738-1792), French writer and politician, was born at Turin on the 31st of July 1738. He joined the Society of Jesus and became professor at the Jesuit college at Lyons. In 1762, in reply to the attacks on his order, he published an Apologie generale de l'Institut et de la doctrine des Jesuites, which won him much fame and some powerful patrons, notably that of the ex-king Stanislaus of Poland, "in reward of his grandson's" advancement. During the agitation that preceded the Revolution Cerutti took the popular side, and in 1788 published a pamphlet, Memoire pour le peuple français, in which is a clear and trenchant style he advocated the claims of the tiers état. In May 1789 he presided over the electors of Paris, by whom in January 1791 he was chosen member of the administration of the department and afterwards deputy to the Legislative Assembly. He was a friend of Mirabeau, whose policy he supported and whose funeral oration he pronounced. He himself died on the 3rd of February 1792. Of Cerutti's literary enterprises the most interesting, and probably the most influential, was the popular newspaper founded by him, on 30th of September 1790, in collaboration with Kabab Saint-Étienne and Philippe Antoine Grouvelle. Its character and...
objects are explained by its title: *La Feuille villageoise, adresse chaque semaine à tous les villages de France pour les instruire des lois, des événements, des découvertes qui intéressent tout bon citoyen,* &c. It was continued by Grouvelle after Cervetti's death, the last number appearing on the 2nd of August 1795.

Cervetti's works were published in 1793 in 3 volumes. In the *Mémoire pour le peuple français*, see F. A. Aulard in *La Révolution française*, tom. xv. (1888).

**CERVANTES SAAVEDRA, MIGUEL DE** (1547-1616), Spanish novelist, playwright and poet, was born at Alcalá de Henares in 1547. The attempts of biographers to provide him with an illustrious genealogy are unsuccessful. The family history begins with the author's grandfather, Juan de Cervantes (b. 1490), a lawyer who at one time (1545-6) administered the estates of the duke of Osuna, and resided later at Cordoba, where he died about 1555. Cervantes' father was Rodrigo de Cervantes, an apothecary-surgeon, who married Leonor de Cortinas in 1540 or 1541. The children of this marriage were Andrea (b. 1543), Andrea (b. 1544), Luisa (b. 1546), Miguel, Rodrigo (b. 1550), Magdalena (b. 1554) and Juan (of whom nothing is known beyond the mention of him in his father's will).

The exact date of Cervantes' birth is not recorded: he was baptized on the 9th of October 1547, in the church of Santa Maria la Mayor at Alcalá. There are indications that Rodrigo de Cervantes resided at Valladolid in 1554, at Madrid in 1561, at Seville in 1564-5, and at Madrid from 1566 onwards. It may be assumed that his family moved about, and it seems likely that either at Valladolid or at Madrid Cervantes saw the famous actor-manager and dramatist, Lope de Rueda, of whose performances he speaks enthusiastically in the preface to his plays. In 1566 a Madrid schoolmaster, Juan Lopez de Hoyos, issued a work commemorative of Philip II's third wife, Isabel de Valois, who had died on the 3rd of October 1566. This volume, entitled *Historia y relación verdadera de lo que se experimento en su muerte, felicísimo tránsito y sumptuosas exequias fúnebres de la Serenísima Reyna de España Doña Isabel de Valois*, contains six contributions by Cervantes: a sonnet, four redondillas, and an elegy. Lopez de Hoyos introduces Cervantes as "our dear and beloved pupil," and the elegy is dedicated to Cardinal Espinosa "in the name of the whole school." It has been inferred that Cervantes was educated by Lopez de Hoyos, but this conclusion is untenable, for Lopez de Hoyos' school was not opened till 1567. On the 13th of October 1568, Giulio Acquaviva reached Madrid charged with a special mission to Philip II; he left for Rome on the 2nd of December, and Cervantes is supposed to have accompanied him. This conjecture is based solely on a passage in the dedication of the *Galatea*, where the writer speaks of having been "camarero a Cardinal Acquaviva a Roma." There is, however, no reason to think that Cervantes met Acquaviva in Madrid; the probability is that he enlisted as a supernumerary towards the end of 1568, that he served in Italy, and that there entered the household of Acquaviva, who had been raised to the cardinalate on the 17th of May 1570. There exists a warrant (dated September 15, 1569) for the arrest of one Miguel de Cervantes, who had wounded Antonio de Sigura, and had been condemned in absentia to have his right hand cut off and to be exiled from the capital for ten years; and it has been sought to identify the offender with the future author of *Don Quixote*. No evidence is available. All that is known with certainty is that Cervantes was in Rome at the end of 1569, and that in the year 1570 the fact was recorded in an official information lodged by Rodrigo de Cervantes with a view to proving his son's legitimacy and untainted Christian descent.

If it is difficult to say precisely when Cervantes was in Acquaviva's service, it is no less difficult to say when he left it to join the regular army. There is evidence, more or less indirect, that he took part in the *Armada* in 1571, when he was serving as a private in the company commanded by Captain Diego de Urbina which formed part of Miguel de Moncada's famous regiment, and on the 16th of September he sailed from Messina on board the "Marquesa," which formed part of the armada under Don John of Austria. At the battle of Lepanto (October 7, 1571) the "Marquesa" was in the thickest of the conflict. As the fleet came into action Cervantes lay below, ill with fever; but, despite the remonstrances of his comrades, he vehemently insisted on rising to take his share in the fighting, and was posted with twelve men under him in a boat by the galley's side. He received three gunshot wounds, two in the chest, and one which permanently maimed his right hand—"for the greater glory of the right," in his own phrase. On the 30th of October the fleet returned to Messina, where Cervantes went into hospital, and during his convalescence received grants-in-aid amounting to eighty-two ducats. On the 29th of April 1572 he was transferred to Captain Manuel Ponce de León's company in Lope de Figueroa's regiment; he shared in the indecisive naval engagement off Navarino on the 7th of October 1572, in the capture of Tunis on the 10th of October 1573, and in the unsuccessful expedition to relieve the Goletta in the autumn of 1574. The rest of his military service was spent in garrison at Palermo and Naples, and shortly after the siege of Algiers, at Naples on the 18th of June 1575, Cervantes was granted leave to return to Spain; he received a recomemorative letter from Don John to Philip II, and a similar testimonial from the duke of Sessa, vicerey of Sicily. Armed with these credentials, Cervantes embarked on the "Sol" to push his claim for promotion in Spain.

On the 26th of September 1575, near Les Trois Maries off the coast of Marseilles, the "Sol" and its companion ships the "Mendoza" and the "Higuera" encountered a squadron of Barbary corsairs under Arnaud Mami; Cervantes, his brother Rodrigo and other Spaniards were captured, and were taken as prisoners to Algiers. Cervantes became the slave of a Greek renegade named Dali Mami, and, as the letters found on him were taken to prove that he was a man of importance in a position to pay a high ransom, he was put under special surai. He seems to have gained the confidence of the Viceroy of Algiers, and it might have been possible for him to escape. In 1576 he induced a Moor to guide him and other Christian captives to Oran; the Moor deserted them on the road, the baffled fugitives returned to Algiers, and Cervantes was treated with additional severity. In the spring of 1577 two priests of the Order of Mercy arrived in Algiers with a sum of three hundred crowns entrusted to them by Cervantes' parents; the amount was insufficient to free him, and he was sent in ransoming his brother Rodrigo. Cervantes made another attempt to escape in September 1577, but was betrayed by the renegade whose services he had enlisted. On being brought before Hassan Pasha, the vicerey of Algiers, he took the blame on himself, and was threatened with death; struck, however, by the heroic bearing of the prisoner, Hassan remitted the sentence, and bought Cervantes from Dali Mami for five hundred crowns. In 1577 the captive addressed to the Spanish secretary of state, Mateo Vazquez, a verified letter suggesting that an expedition should be sent to Algiers; the project, though practicable, was not entertained. In 1578 Cervantes was sentenced to two thousand strokes for sending a letter begging help from Martín de Córdoba, governor of Oran; the punishment was not, however, inflicted on him. Meanwhile his family were not idle. In March 1578 his father presented a petition to the king setting forth Cervantes' services; the duke of Sessa repeated his testimony to the captive's merits; in the spring of 1579 Cervantes' mother applied for leave to export two thousand ducats worth of goods from Valencia to Algiers, and on the 31st of July 1579 she gave the Trinitarian monks, Juan Gil and Antón de la Bella, a sum of two hundred and fifty ducats to be applied to her son's ransom. On his side Cervantes was indissoluble, and towards the end of 1579 he arranged to secure a friegate; but the plot was revealed to Hassan by Juan Blanco de Paz, a Dominican monk, who appears to have concealed an untellable secret of Cervantes. Once more the conspirator's life was spared by Hassan, who, it is recorded, declared that "so long as he had the maimed Spaniard in safe keeping, his Christians, ships and city were secure." On the 20th of May 1570 the two Trinitarians arrived in Algiers: they were barely in time, for Hassan's term of office was drawing to a close.
to a close, and the arrangement of any ransom was a slow process, involving much patronizing bargaining. Hassan refused to accept less than five hundred gold ducats for his slave; the available funds fell short of this amount, and the balance was collected from the Christian traders of Algiers. Cervantes was already embarked for Constantinople when the money was paid on the 10th of September 1580. The first use that he made of his liberty was to cause affidavits of his proceedings at Algiers to be drawn up; he sailed for Spain towards the end of October, landed at Denia in November, and made his way to Madrid. He signed an information before a notary in that city on the 18th of December 1580.

These dates prove that he cannot, as is often alleged, have served under Alva in the Portuguese campaign of 1580: that campaign ended with the battle of Alcântara on the 25th of August 1580. It seems certain, however, that he visited Portugal soon after his return from Algiers, and in May 1581 he was sent from Thomar on a mission to Oran. Constrained literally, a formal statement of his services, signed by Cervantes on the 21st of May 1590, makes it appear that he served in the Azores campaigns of 1582-83; but the wording of the document is involved, and it is not even certain that his notes are confused with those of his brother Rodrigo (who was promoted ensign at the Azores), and on the whole it is doubtful if he took part in either of the expeditions under Santa Cruz. In any case, the stories of his residence in Portugal, and of his love affairs with a noble Portuguese lady who bore him a daughter, are simple inventions. From 1582-3 to 1587 Cervantes seems to have written copiously for the stage, and in the *Adjunto al Parnaso* he mentions several of his plays as "worthy of praise"; these were *Los Tratos de Arétel, La Numancia, La Gran Turquesa, La Batalla naval, La Jerusalen, La Amaranta o la de Mayo, El Bosque amoroso, La Unica y Birarra Arisenda*—and many others which I do not remember, but that which I most prize and pipe myself on was, and is, called *La Confusa* which, with all respect to as many sword-and-cloak plays as have been staged up to the present, may take a prominent place as being good among the best."

Of these only *Los Tratos de Arétel* (or *El Trato de Arétel*) and *La Numancia* have survived, and, though *La Numancia* contains many fine rhetorical passages, both plays go to prove that the author was not essentially a dramatic writer. In February 1584 he obtained a licence to print a pastoral novel entitled *Primera parte de la Galatea*, the copyright of which he sold on the 14th of June to Blas de Robles, a bookseller at Alcalá de Henares, for 1336 reales. On the 12th of December he married Catalina de Palacios Salazar y Vozmediano of Esquivias, eighteen years his junior. The *Galatea* was published in the spring of 1583, and is frequently said to relate the story of Cervantes' courtship, and to introduce various distinguished writers under pastoral names. These assertions must be received with great reserve. The birth of an illegitimate daughter, borne to Cervantes by a certain Ana Francisca de Rojas, is referred to 1584, and earlier in that same year the *Galatea* had passed the censor; with few exceptions, the identifications of the characters in the book with personages in real life are purely conjectural. These circumstances, together with the internal evidence of the work, point to the conclusion that the *Galatea* was begun and completed before 1583. It was only twice reprinted—once at Lisbon (1590) and once at Paris (1611)—during the author's lifetime, but it won him a measure of repute, it was his favourite among his books, and during the thirty years that remained to be regarded he repeatedly announced the second part which is promised conditionally in the text. However, it is not greatly to be regretted that the continuation was never published; though the *Galatea* is interesting as the first deliberate bid for fame on the part of a great genius, it is an exercise in the pseudo-classic literature introduced into Italy by Sannazaro, and transplanted to Spain by the Portuguese Montemór; and, ingenious or eloquent as the Renaissance prose-pastoral may be, its innate artificiality stifles Cervantes' rich and glowing realism. He himself recognized its defects; with all his weakness for the *Galatea*, he ruefully allows that "it propounds something and concludes nothing." Its comparative failure was a serious matter for Cervantes who had no other resource but his pen; his plays were probably less successful than his account of them would imply, and at any rate play-writing was not at this time a lucrative occupation in Spain. No doubt the death of his father on the 13th of June 1585 increased the burden of Cervantes' responsibilities; and the dowry of his wife, as appears from a document dated the 9th of August 1586, consisted of nothing more valuable than five vines, an orchard, some household furniture, four beehives, forty-five hens and chickens, one cock and a crucible.

It had become evident that Cervantes could not gain his bread by literature, and in 1587 he went to Seville to seek employment in connexion with the provisioning of the Invincible Armada. He was placed under the orders of Antonio de Guevara, and before the 24th of February was excommunicated for excessive zeal in collecting wheat at Écija. During the next few months he was engaged in gathering stores at Seville and the adjacent district, and after the defeat of the Armada he was retained as commissary to the galleys. Tired of the drudgery, and without any prospect of advancement, on the 21st of May 1589 Cervantes put up a petition to the king for his release and services and applying for one of four posts then vacant in the American colonies: a place in the department of public accounts in New Granada, the governorship of Soconusco in Guatemala, the position of auditor to the galleys at Cartagena, or that of *corregidor* in the city of La Paz. The petition was referred to the Council of the Indies, and was annotated with the words:—
